Nor must I forget, while dealing with this somewhat elaborate class of late-flowering varieties, that venerable tea rose, Souvenir d'un Ami, one of my oldest and best-loved favourites; and its snow-white variation, discovered by the eminent Oxford rosarian, whose honoured name and fame it is likely to perpetuate—Souvenir de S. A. Prince. Throughout the whole summer and autumn these bloom almost, I might say, without intermission. Their period of rest is in every instance extremely circumscribed: like Marie Van Houtte—a charming companion for these—they are either blooming luxuriantly or preparing rapidly to bloom. Noisette roses, as a general rule, are not very reliable for what may be termed autumn production; though Caroline Kuster and Aimée Vibert are striking exceptions. On the other hand, China and polyantha roses, which are among the most thoroughly perpetual of all, always seem to wish to make final and specially heroic efforts on the confines of winter, as if conscious that the period of involuntary floral cessation were not far away. Their flower buds at this season are like Henry Kirke White's early Primrose, "born in whirling storms, and cradled in the winds." Turner's Crimson Rambler has of late given evidence of something like perpetuality, by suddenly generating on the west wall of my garden a veritable shower of miniature buds.

Among the grandest of autumnal bloomers are the hybrid teas, and especially such splendid varieties as La France, Augustine Guinoisseau, Caroline Testout, the highly fragrant Viscountess Folkestone, Clara Watson, Grace Darling, White Lady, Madame Pernet Ducher, Marquis Litta, Marjorie, and Gloire Lyonnaise. Roses of this character are invaluable for garden culture, combining as they do the finest characteristics of the hybrid perpetuals with the free-flowering qualifications of the teas.

DAVID R. WILLIAMSON.

PERENNIAL POLYGONUMS.

THOUGH being a large genus, only a few of the polygonums are of real value as ornamental plants, and on this account many of them are almost unknown outside the collections of botanical gardens. Among them there are, however, a small number of the most interesting and pretty of hardy perennials, their singular beauty entitling them to a place in the collection of every admirer of that class of plants, and excepting one or two species, which for some unaccountable reason are difficult to manage, all are easily grown, not being partial to any soil, situation, or time of planting, their peculiar rhizomatous root stocks fitting them to all sorts of conditions, and they thrive under the most adverse circumstances.

Polygonum alpinum is a handsome plant, forming in the course of a few years a nice bush two to three feet in height, and producing its numerous panicles or plumes of white flowers uninterruptedly from June till September; very useful as a border plant or for cut flowers. P. amplexicaule produces its pretty, bright rosy red flowers in racemes borne on wiry stems clothed with rather large foliage; the root stock is deep rooted and woody. This species flowers during the summer and autumn. P. affine belongs to quite a different class from the former, being close-growing, covering large patches of ground, and having handsome foliage, linear or lanceolate in outline, and dense spikes of bright rosy flowers. Its close-growing and perpetual-flowering habit adapts it for growing either on the rockery, in borders or in baskets.

P. spærostachyum somewhat resembles the pretty P. amplexicaule as far as habit is concerned, only it is dwarfer, closer, and less rapid in growth. It forms loose bushes, the wiry stems being clothed with handsome, bright green, lance-shaped foliage, the racemose flowers on the extremities of the stems being of the brightest and most intense rose colour, making it one of the most showy of hardy herbaceous plants. Unfortunately its culture has not been always the most successful, and more than once this charming plant has disappeared from the catalogues of the specialists, as well as out of the garden of the amateur, necessitating its reintroduction from the Himalayas. P. compactum, although not quite as showy as the former, has a dwarf habit with pretty heart-shaped and bright green foliage, as well as white flowers, these latter appearing uninterruptedly through the whole of the summer. Its fitness to be used as an undergrowth constitutes this species a very useful plant, especially for exposed positions. P. cuspidatum (P. Sieboldi): To do justice to this species it should be used as a solitary plant on the lawn, border, or shrubbery, and there are few plants more ornamental and stately than it. Being of rapid growth it soon forms a compact clump from six to ten feet in height. Its slender stems, with its more or less fan-shaped branches, bend outward, displaying the bright green, heart-shaped foliage and axillary, catkin-like spikes of green flowers. This plant can, however, only be effectively used in large gardens. P. sacchaliense, like the last, can be used with great effect as a foliage plant, with the difference that it refuses to grow exactly where one wants it to on account of its stolons or rhizomes rapidly running away from the orginal plant, and I have known cases where in the course of time the suckers travelled through a hard piece of roadway and were found growing two hundred yards away from where the original plant was placed. The foliage of this is much larger than in any of the former, and is of the deepest green colour and forming, with the showy, pure white racemes of flowers, a fine combination, being, in spite of its straggling habit, well worth a place in a collection of hardy plants. Some years ago it was strongly recommended as a valuable fodder plant, and large quantities were bought up in this country and exported to the Continent, principally to France, but not having heard much about it lately one may presume it was not the success anticipated.

P. vaccinifolium is a very desirable trailing or climbing plant, and, considering its usefulness for both out and indoors, it is, I consider, not often enough grown. Its habit is shrubby, with wiry stems that grow rapidly over pieces of rockwork, old walls, banks, or borders. The leaves, being rather small and of the lightest shade of green, set off the racemes of pale pink flowers produced in the greatest profusion through the whole summer. P. baldschuanicum is still very rare, though exceedingly beautiful, and I feel sure, when better known, it will not be missing even from the smallest collection of herbaceous plants. It is one of the most rapid-growing climbing plants I know. Here, at the Hale Farm, the tiniest plants, grown in pots for one year and then planted in the open in the spring, have by the time I am writing (end of October) grown into magnificent specimens, and with its pretty heart-shaped foliage and graceful, charming panicles of pure white flowers, produced on the extremities of the branches, is more beautiful than anything at present flowering. On account of its slender habit there is need of support, such as a dead tree, over which it twines in a very short space of time. The past summer I had the good fortune to see a fine specimen in the southern part of Germany, resembling, when seen from a distance, a huge Spiræa japonica, with its plumes of white flowers. There is little to be said about its culture, as it seems to be perfectly hardy, none of the wood dying away during the winter; the leaves, however, fall off after the first sharp frost. It was introduced about 1888 from Eastern Buchara.

G. REUTHE.

VEGETABLE FORCING.

Now that the leaves have fallen and winter is at hand, preparations for forcing vegetables must no longer be delayed if we are desirous of keeping the kitchen constantly supplied with choice vegetables. To ensure success a certain amount of care and forethought must have been exercised previously, for no mode of forcing vegetables will produce satisfactory results unless the roots or crowns of the various crops be of the best; therefore good cultivation during the summer months is indispensable. I propose here to deal with three kinds of vegetables, and these the best.

Asparagus.

It is our practice to provide this really excellent vegetable constantly from the end of November until April. Our plan is to lift annually two large beds from the quarter devoted to asparagus, two young beds being annually planted to replace them, and by this process we obtain yearly a valuable piece of ground for an important future crop in the kitchen garden. Although the forcing of this vegetable is simplicity itself, I would draw attention to a few features which are essential to success. In the first place, if urged too speedily in a close, moist atmosphere, it becomes tall, colourless, and devoid of flavour; on the other hand, if insufficient heat be given, it will be tough and malformed. I have as yet found no plan better than the old one of making up a hotbed of stable manure and placing a frame thereon; this bed will afford just that amount of heat, as well as ammonia, that the asparagus likes. Of course attention should be given to lining the bed to maintain a uniform temperature (in mild winters this will hardly be necessary). A covering of mats or similar material will be required in frosty weather, and abundance of air on all favourable occasions is of the utmost importance, though this must be given judiciously, the state of the weather being taken into consideration. It is a well-known fact that if we wish to bring out that natural green colour of the stems that is so much admired, and without which it is somewhat insipid, a course of treatment must be followed as nearly allied to Nature as is possible, and to attain this object it is obvious that light and air must be accorded. For the first few batches a temperature of from 65 to 80 degrees will not be too much, but for the later supply 60 to 70 degrees will be ample. A few roots, according to the demand, should be lifted about every fortnight, or more often if required, and a layer of half-rotted leaves should be placed over the surface of the bed, also working some of this material about the roots; a good watering with lukewarm water may then be given to settle the whole. A handful of common salt dissolved in the water will prove beneficial.

Seakale.

The old practice of forcing seakale out of doors by covering the crowns with pots has given place to other and much improved methods. Generally speaking, in establishments where large quantities of this vegetable are required during the winter, bins or boxes fitted with lids to exclude air and light are constructed in the mushroom house, or other similar structures for the purpose, with hot-water pipes running through or beneath them; or, failing these, some stable manure or tan will answer admirably, provided that these do not become too hot. A temperature of 60 to 65 degrees, or at the most 70 degrees, is sufficient, as it is much better to apply heat in moderation, especially so early in the winter. Seakale requires but little room in which to grow when forced; a bin of about six or eight feet in length, and three or four in width, will accommodate a great number of crowns, and these may be brought in and plunged every nine days, or as often as is required to keep up a supply. Any light material, as leaves or tan, answers the purpose for plunging. For the late supply forcing in the open air is resorted to here with excellent results; in fact, we obtain some extraordinarily large and tender heads by the following method. The crowns are planted in a double row at about one foot apart each way, and these rows we usually contrive to have near the garden paths for convenience in cutting. Early in the month of February they are covered to a depth of fifteen inches with mushroom bed refuse in the form of a ridge, and these ridges are examined carefully every day after the heads commence pushing up the material. Strict attention should be paid to this operation, or the tips of the young leaves quickly become purple. These plants are left on the same spot two, and sometimes three, years, after which they may be destroyed, and either replaced with young plants or with one-year-old crowns. This system has much to recommend it for late supply, being little trouble, and the produce is decidedly better than could be obtained in mushroom houses during the latter part of the month of March and onwards.

Mushrooms.

So much has been advanced respecting the successful cultivation of mushrooms that it may appear somewhat superfluous to record my experience; nevertheless, as we have been very successful, the few notes I shall offer may not be unacceptable. The material often employed for the beds consists of horse-droppings, with as little litter as possible, but if a large and constant supply is to be maintained, and the number of horses kept be few, it becomes necessary to incorporate with the droppings a certain amount of litter, which is in the natural course of things well saturated with urine, and I find that quite as good results may be obtained by utilising some of the litter. I have made note of the fact that market growers, generally speaking, use a quantity of rough material, and the result they attain speaks for itself. The manure should be collected, placed in an open shed, and frequently turned before making up the beds. The durability of the beds will depend in a great measure on the depth they are made and the firmness with which they are rammed. Deep beds are apt to become too hot, and this is detrimental to the running of the spawn; therefore I consider that a depth of twelve or fifteen inches is sufficient. The temperature of the bed when spawned should not exceed 85 degrees, and be just on the decline. After the spawn is inserted the surface of the bed should be covered with good mellow loam to about one and a-half inches in thickness; this needs to be moist, and of the same temperature as the bed. No water should be applied unless absolutely necessary, but rather maintain a constant humidity in the atmosphere of the house. If this be closely attended to, and care is exercised to allow but little fire-heat, and a temperature of from 55 to 65 degrees will suffice, excellent results will follow.

Stoneleigh Abbey Gardens. H. T. Martin.

LONDON GARDENS IN OLDEN TIMES.

It is recorded by FitzStephen, the chronicler, that in the reign of Henry II.—the latter half of the twelfth century—the inhabitants of London had large and beautiful gardens attached to their dwellings. In 1276 the Royal Garden at Westminster was celebrated for the great numbers of roses and lilies grown there, and there is still an order extant of Edward I. for pear trees for his garden. Stow relates that round about Somerset House large gardens were cultivated for profit, as likewise at many places in the City, where vegetables and fruit were grown in such profusion as to amply satisfy the wants of the citizens without their depending upon consignments from elsewhere. People in those days took the air and their walks in their own gardens. Bishopsgate, the Minories, Goodman's Fields, and many other large open spaces in the neighbourhood were large gardens and orchards where the gardener's skill was brought into requisition. Cattle grazed and archers shot at Finsbury, and it was in rural Islington that Dame Owen was nearly shot by an arrow as she was promenading in her demesne, and which event caused her to devote a large sum in the erection of free schools, which, under different conditions, survive to the present time. Where Shaftesbury Avenue now runs was the village of St. Giles, famous for its garden produce, and Charing Cross and Whitehall had their State gardens. Spring Gardens, of course, were so in reality as well as name. Holborn enjoyed great fame for its gardens, Ely Place having both flower and kitchen gardens, together with a vineyard and orchard, and the bishops enjoyed great reputation for their fruits.

Gerarde, the botanist, about three hundred years ago, had a large garden in Holborn, where he raised a thousand plants and trees. In 1596 he printed a catalogue of it, dedicated to Lord Burleigh, whose garden he had superintended for twenty years. It may be seen in the British Museum. The first edition of his "Herbal" is also dated from there. Writing of violets, he says, "Of water violets I have not found any such plenty in any place as in the water ditches adjoining to St. George his fielde near London." He also mentions that pennyroyal grew in the greatest abundance in the Minories, and many fine plants in the ditches of Piccadilly. Baldwin's Gardens was a nursery of one Baldwin, a gardener to Queen Elizabeth. Lincoln's Inn, in those days the residence of the Earl of Lincoln, was famous for its grapes, pears, and roses. The Temple Gardens have ever been famous, and Shakespeare laid the origin of the Wars of the Roses there. These gardens are still well kept, notably so until a year or two ago, when an edict of the Benchers went forth that the chrysanthemums, for which they had acquired great fame, were to be no longer grown, and horticultural retrenchment was to be made. The gardens of Gray's Inn owe their inception to Lord Bacon, himself a practical gardener, who took a great deal of interest in them, and did much to further their reputation. There is still a catalpa tree there, which was originally planted by him. Such are a few of the memories of the past which crowd before the fancy as the busy streets of this modern Babylon are traversed by the thoughtful wayfarer.

Wm. Norman Brown, F.R.H.S.

IS THE ONION SURFACE ROOTING?

The question of whether the onion is a surface-rooting or deep-rooting vegetable has been the subject of much comment and discussion in an East Anglian gardening community of late. The discussion was commenced by a horticultural lecturer assuring his audience that the onion was only surface-rooting, and illustrating his assertion by chalk drawings on a blackboard. Cottagers were advised to dig manure just below the surface in ground for onions, and to subsequently use top dressings. The old plan of digging manure under the top spit was considered wasteful, as onion roots could not possibly reach it. Some old onion growers present thought differently, as they had found onion roots at least two spits' depth from the surface, and always made a practice of digging plenty of manure deeply into onion beds. Their opinion was privately communicated to the lecturer, who still, however, stuck to his assertion, and intimated that market growers annually produced fine market crops by surface dressings alone.

The lecturer's attention was drawn to the able articles on Onion Culture by Mr. E. Beckett, published in the Gardeners' Magazine, March 26 and April 2, pp. 197 and 212, wherein it was recommended that the soil be broken up two feet six inches and a layer of manure placed at the bottom. At the succeeding lecture the lecturer said those gardeners who considered the onion as deep-rooting, and acted accordingly, wasted their employers' property and time, and hinted at the undesirability of deep cultivation for this crop. One grower stated that the onion was the deepest rooted of any garden vegetable he knew among those with divided roots. The lecturer's response was to bring forth an onion produced by a prizetaker who followed the surface manuring principle only; it was a specimen of the flat Spanish type. "Very small and lean," someone remarked. "Yes," was the reply, "that was owing to the drought." Most of us thought the lecturer had given his case away, especially when we remembered how many cottagers had, by deep digging and manuring, obtained better onions than the one shown, in spite of drought.

Now, ye onion growers, who place manure in two layers when preparing onion beds, you are invited to show cause why you thus waste your employers' material, and to no purpose? Perhaps Mr. Beckett will have a word or two to say in defence of his methods, and I am sure the editor will find room in the Gardeners' Magazine for what Messrs. Fyfe, Bowerman, Pope, and other champions have to say upon the matter, also the remarks of any market growers.

S. P., *East Anglia.*

[We shall be pleased to afford the space necessary.—Ed]

WORK FOR THE WEEK.

WARM ORCHIDS.

OWING to the decrease of sun heat, the short days and long nights, the present is an unsatisfactory time to do any repotting in the warm houses. Sometimes, however, we have one or two plants out of season which are making brave attempts to produce new roots, and, as the compost has not been removed for a considerable time, it is becoming sour, therefore repotting must be beneficial to such, and, if neglected, the roots will die off. We must now do all we can to ensure the plants having all the light obtainable. Take down all the thin cotton blinds, wash them with soap and water, and see that they are thoroughly dry before storing until next spring. With respect to heavy roller blinds, one has to consider the conditions and requirements of the houses. If in a cold, bleak place, and the boiler power or amount of piping is inadequate to properly combat cold winds and frost, then such blinds may be a great help if let down in bad weather. It is far better to use the blinds thus than to fire severely, as some of our amateurs are in the habit of doing. If there is sufficient heating apparatus, take down the blinds, roll them up, and put them away, after being well washed, dried, and labelled. Where orchid-houses are situated near large towns, the recent dull weather will have resulted in a deposition of soot upon the glass, while in more open situations, permanent shading, such as summercloud and stipple, will yet remain; but the time has now arrived when all this must be removed, and the glass thoroughly cleansed with hot water.

All orchids of whatever section, that have completed their growth, must have as much light as can be given them at this period to substantiate their growths. All the cattleyas must be placed as near the glass as convenient and reasonable, they can easily be raised on pots or stands of any description that will answer the purpose; where a second or false stage is provided a good plan is to raise the stage up with a few bricks, glazed ones or good Ruabons look nice when clean and answer admirably. A good plan is to place these bricks in a large saucer, which must be kept filled with water, and so prevent slugs or beetles from climbing on to the stage. Before this is done each plant may be placed in a tub of water, allowing it to remain in for about 15 minutes, so that if any pest is hiding this will force it out; we are sure then to have a clean start. Any baskets hung underneath the ridge of the house where much woodwork exists must be removed near the light. — T. STAFFORD, *Tyntesfield Gardens.*

STOVE PLANTS.

THE work in the stoves will now be of a routine nature, watering, damping, syringing, when the weather is favourable; tying, sponging, and the application of insecticides as necessary for the destruction of insect pests. During the winter months is the best time to wage war for the destruction of the latter, for growth being matured insecticides may be applied stronger than when the plants are in active growth, and the leaves consequently more tender. In the case of mealy bug it is not merely necessary to clean the plants infested, but the walls should be washed with lime into which petroleum has been mixed, working this well into all the crevices; all the woodwork, stages, underneath as well as over, should be well scrubbed with soapy water containing petroleum. Any rubbish lying amongst the pipes must be carefully removed, and, in fact, every corner where there is likely to be harbourage for it must be carefully scoured. Even after all this labour the pest may still make its appearance, but in such reduced numbers that it will be an easy matter to keep it in subjection. For eradicating thrip sponge frequently and fumigate two nights in succession at intervals with "X L All" fumigating compound. If this is followed out thrips will be completely banished. For destroying scale there is nothing to surpass syringing the plants with petroleum emulsion, and sponging at intervals with strong soapy water, always taking the plants in hand before any of the scale arrives at maturity. Little or no ventilation will be required in the stove, as at this season sufficient air will gain ingress between the laps of the glass, and when the doors are opened. Should bright weather occur, check the fire in preference to opening the ventilators, for, however carefully the latter are manipulated, the cold air is likely to reach some of the plants to their detriment.

Gloxinias and achimenes that are quite at rest should be placed in their winter quarters—a dry position with a temperature of 45 to 50 degrees; we pack ours away on a shelf in a stokehole where the temperature is as named above. The earliest-rested tubers that were started again a few weeks ago are now growing nicely, they will not require repotting; keep them in the stove well up to the light and afford weak stimulants occasionally. During the prevalence of very dull weather be very careful over the watering of all stove plants, test each plant carefully, and give only sufficient to each for its requirements. The racemes of Thyrsacanthus rutilans are advancing rapidly, and to show off their full beauty the plants should either be elevated on other pots inverted, or be slung to the roof by means of wire. Justicias are now in full beauty, and are very useful at this season; stand them in a cooler structure and keep the syringe from them. Aphelandra Roezli is one of the most showy stove plants in flower now; it needs plenty of water at the root, but should be kept dry overhead. Eranthemum pulchellum, Rondeletia speciosa, poinsettias, and eucharis are among the remaining plants in flower in the stove at this season. The minimum night temperature for the next few weeks may range from 60 degrees on cold nights to 65 on mild nights, with a rise of 5 degrees during the day from fire heat.

The majority of ferns will now have ceased growth; it will be necessary to keep the atmosphere drier, and also afford less water at the root, but be careful they are not allowed to become too dry, else they will suffer severely. Cheilanthes, gymnogrammas, and nothochlænas are especially susceptible to damp at this season, and must be placed in positions free from drip. Examine adiantums regularly and remove all decaying fronds, for if this is not attended to large specimens may soon be spoiled by damp. Watering should be done in the early part of the day, so that the moisture may dry up before night. The warm fernery may be kept at a temperature of 55 to 60 degrees at night, and 60 to 65 degrees during the day—the lower figures denoting the temperature for cold days and nights.—J. TUNNINGTON, *Ripley Castle Gardens.*

THE FLOWER GARDEN.

WITH regard to roses and rose planting the habit and vigour of the varieties must guide the planter as to the requisite distance apart the plants should be placed. If beds of mixed varieties are to be planted, a distance of two to three feet apart would generally suffice, although for beds of one variety the distance may be more or less according to the strength and habit of growth of the variety. Upright growing roses, such as Baroness Rothschild and those of similar habit, may be planted not more than two feet apart, while stronger growers, as Duke of Edinburgh and vigorous tea roses, should be placed from two and a-half to three feet apart. In selecting varieties for the garden those which generally grow and bloom freely should be chosen rather than mere exhibition varieties. Of H. P.'s in pink shades the following are free and good: Baroness Rothschild, Mrs. Sharman Crawford, Mrs. John Laing, Madame Gabriel Luizet, Captain Christy, and La France; of crimson and red shades Alfred Colomb, Duke of Edinburgh, General Jacqueminot, A. K. Williams, Ulrich Brunner, Gustave Piganeau, Marquis de Castellane, Victor Verdier, Beauty of Waltham, Countess of Oxford, Madame Victor Verdier, and many others; white or light varieties, Margaret Dickson, Merveille de Lyon, Madame Augustine Guinoisseau, and Violette Bowyer are among the best. Good tea varieties are numerous, and Marie Van Houtte, an old variety, is still one of the best. Other most desirable ones are Catherine Mermet, Madame Lambard, Francisca Kruger, Hon. Edith Gifford, The Bride, Souvenir d'un Ami, Souvenir de S. A. Prince, Perle des Jardins, Madame de Watteville, Innocente Pirola, and Rubens. The hybrid sweetbriars are well adapted for planting in semi-wild gardens or pleasure grounds, and as isolated specimens are effective, as they grow into large bushes in a short time and require little pruning, as the long strong shoots should be retained at full length.

In the pleasure grounds general cleanliness should be maintained as far as possible. The relaying and levelling of turf may be taken in hand now, and in herbaceous borders decaying stems and foliage should be cleared away, and where contemplated any rearrangement and division of these subjects may be carried out as long as the weather remains mild and open. Owing to the very dry state of the soil about the roots of evergreen trees and shrubs, the lifting and planting of these subjects has been almost impossible in most districts until recently, and even at the time of writing the moisture has not penetrated the dry soil to scarcely the depth of one foot. Where, however, it is desired to move American plants as rhododendrons, kalmias, andromedas, and others of this class this autumn it should be completed during the present month. Although the spring months are perhaps preferable, there is often a pressure of ordinary routine work to be got through at that season, and for this reason planting of these subjects may take place now. A considerable amount of labour is requisite in the preparation of the sites for rhododendrons where the natural soil of the place is not congenial to them and the beds have to be artificially made up, as is the case where of a heavy, clayey nature, or in soils abounding with chalk and limestone. In this case the natural soil must be thrown out to the depth of 18 inches or more and made up with peat, keeping the rougher portions at the base and affording drainage below if necessary. Failing the peat a mixture of light, fibrous loam and leaf mould in equal parts may be used. It should be well trodden—unless in a wet state—and will then, when finished, be in a condition to receive the plants at once. If immediate effect is desired they should be planted thickly now, according to the size of the bushes, to be thinned out and transplanted to other positions later when this is necessary from overcrowding. Hybrid rhododendrons are numerous, and any reliable catalogue will furnish a ready means of selecting good varieties of various colours. Some of the early blooming varieties of the Nobleanum type should be planted in sheltered positions in a west aspect, or where screened by deciduous trees from spring frosts and early morning sun, as the flower trusses are often valuable for indoor decoration at this season. Andromeda floribunda is also useful, and the flowers do not suffer unless frost is severe. —C. HERRIN, *Dropmore Gardens.*

HARDY FRUITS.

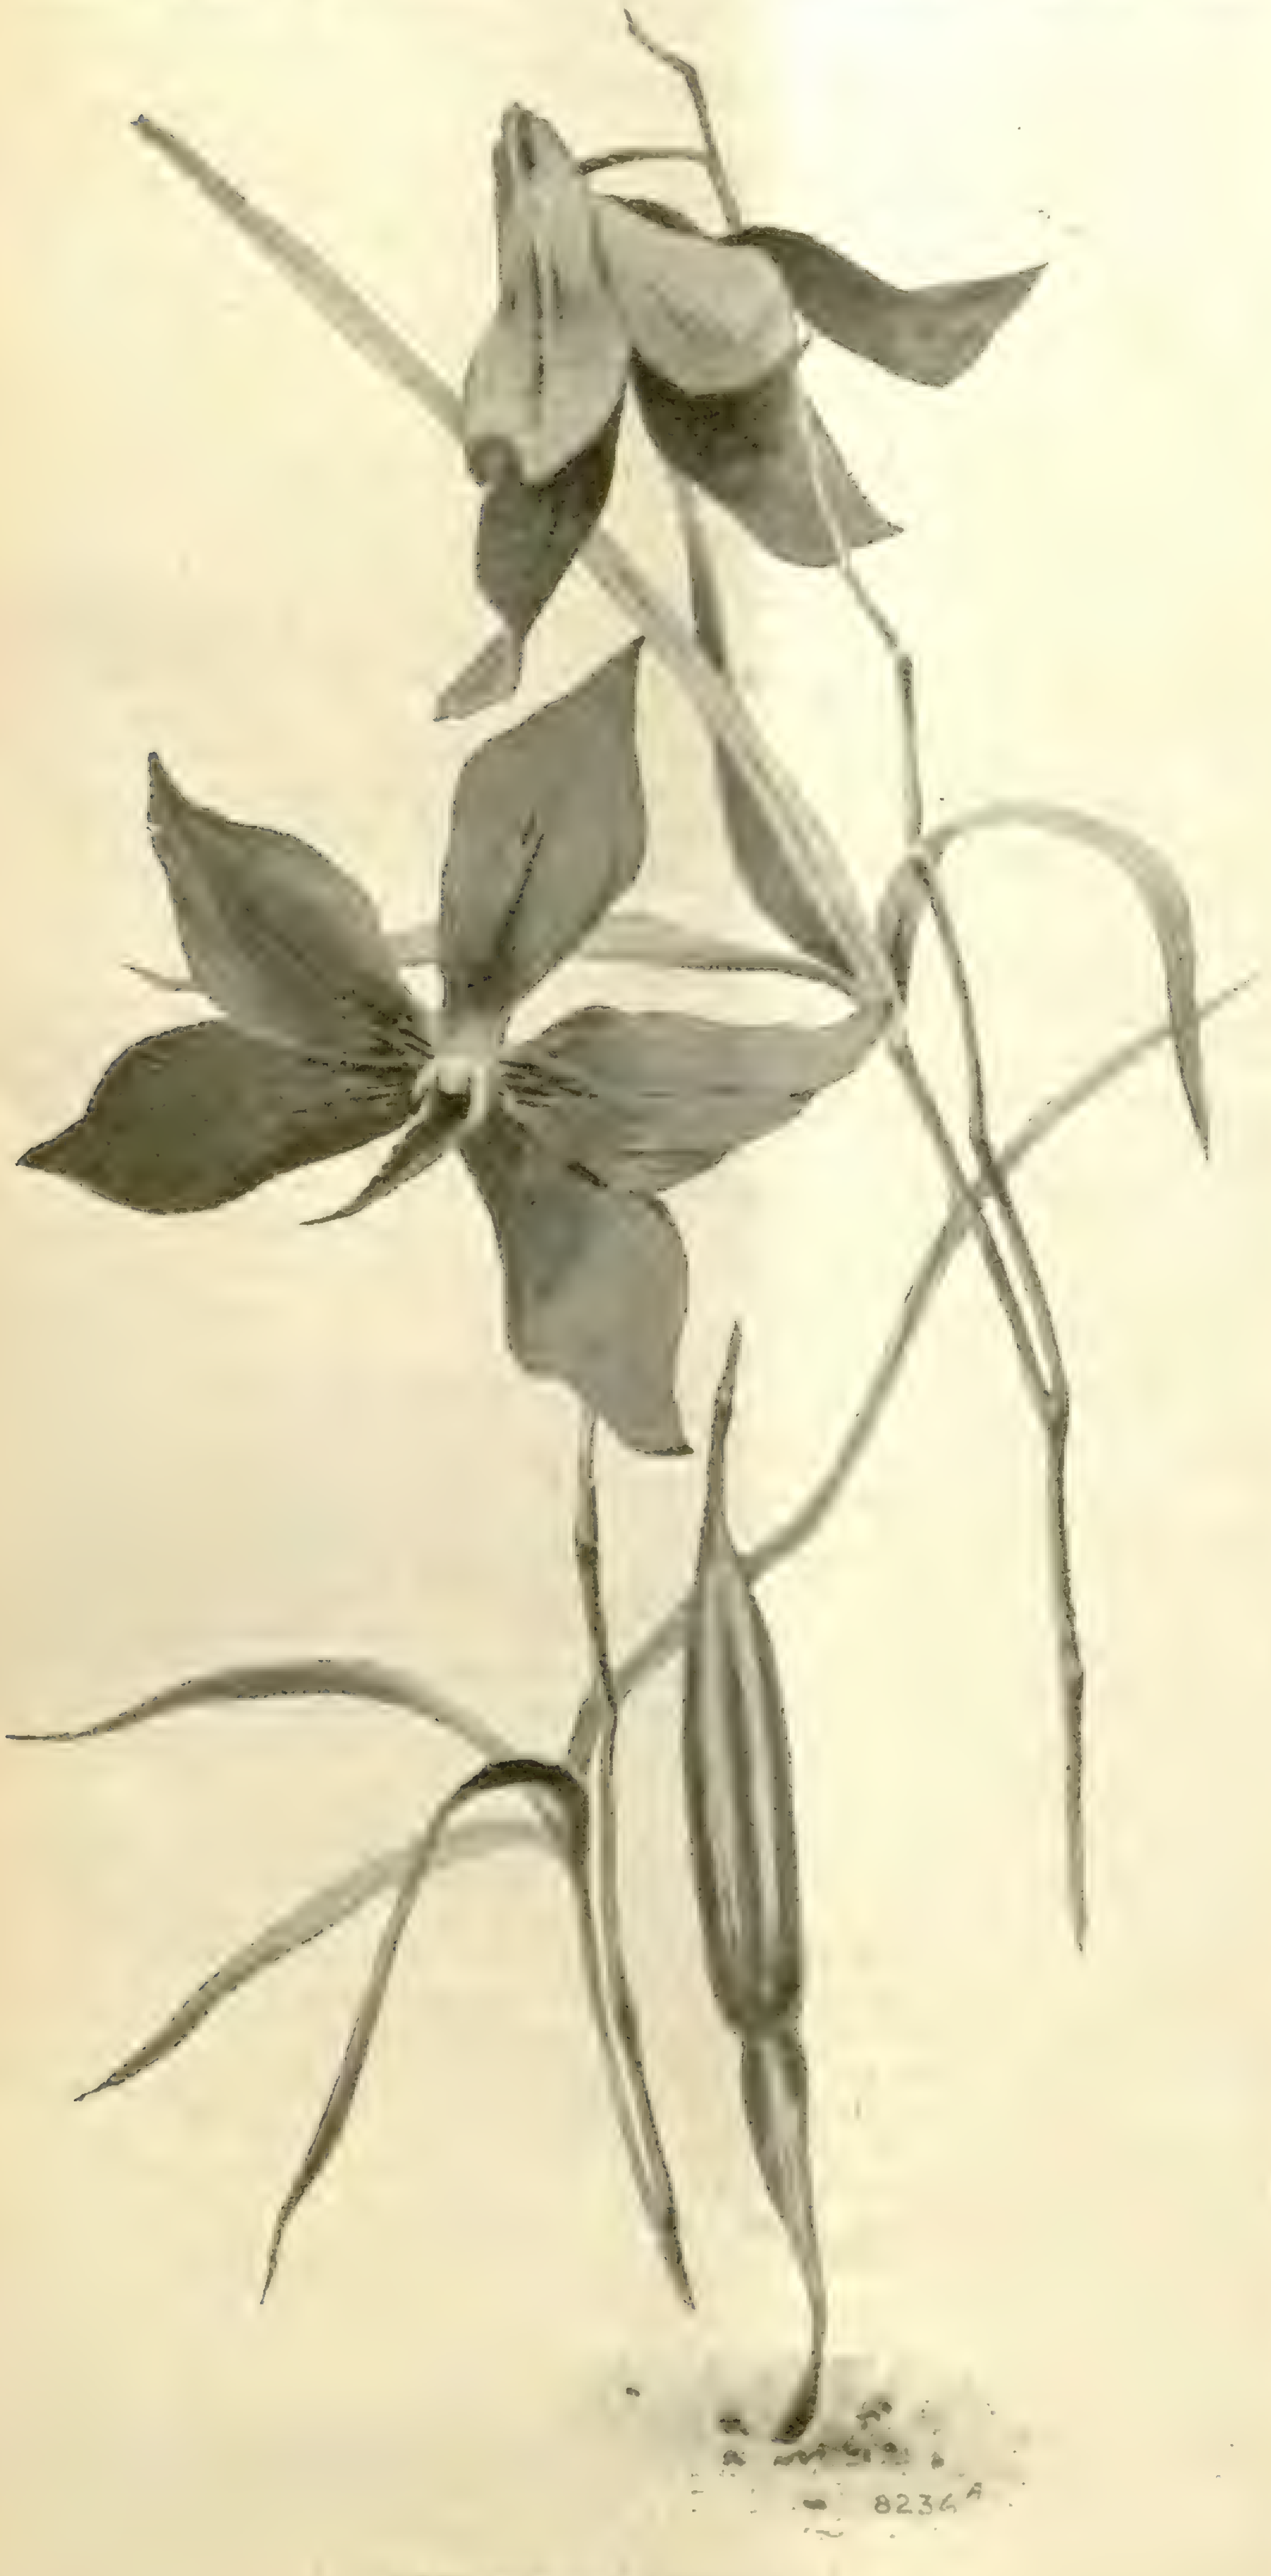
THERE is now plenty of work in the fruit garden, as with the ground in good condition for planting there should be no further delay. I am much in favour of early planting, but am aware it is not always easy to secure trees from the grower just at the time we need them; thus it is always better to place our orders in August or September than wait till the trees are needed. Another great point is to go and select the trees whilst in growth, as by so doing much the best material is obtained. With a thin, light soil to deal with, and this resting on gravel, we find it advantageous to have all our planting done as early in November as possible; indeed, such fruits as apricots, peaches, and nectarines are planted or lifted in October. Many may think there is danger of the bark shrivelling, but young trees having ample roots rarely suffer; indeed, there is a great gain, as the trees make a mass of fibrous roots as soon as planted, and, what is so important, they do not fail to crop the following season. Of course to obtain trees in October from a long distance is out of the question, and so to secure ample root growth we grow the trees on for a season, and by so doing can finally plant much earlier. This, in our soil, is a great gain, as if we plant after Christmas the trees need so much attention in the way of watering at a time when it is almost impossible to attend to their wants. It is an easy matter to devote a small space for the growth of young fruit trees; indeed, in our case it is a necessity, as some varieties, such as apricots and cherries, are none too reliable, and it often happens we need a young tree to replace one that has lost its branches, and we find those grown on as advised most useful. In other ways the advice given may not be out of place, for many can buy maidens, or one year old trees, who could not buy more costly ones, and by purchasing a few every year there will be a good stock and those of the best kinds. Whilst on this subject let me add there is no value, indeed the reverse, in harbouring old trees after badly cankered and unsightly in any garden, as these look bad enough in our orchards, but a garden should have the best and those that are profitable. I am aware there is a difficulty in some gardens in getting rid of such trees, but it is mistaken sentiment to allow the soil to be encumbered by them.

There is a great improvement in the growth of trees of late years in gardens of limited area. It is an excellent plan to plant the trees in rows, so that the sun and light can reach all parts; the apple on a dwarf stock, such as the Paradise, and the pear on the quince, are readily managed. Given ample room the best crops are secured from standard trees, and I think the best quality also in some cases; indeed, our best Ribston and Cox's Orange Pippins this year were from small standard trees, but the fruit lacked the size of those from dwarf trees. Those who need fruit in quantity for sale will do well to note the manner some varieties crop, and here let me add there is no merit whatever in mere variety; indeed, for market purposes, doubtless, half a dozen kinds would suffice. As regards the kind of tree, this will be governed by the variety, soil, and position, for in some soils certain varieties do not thrive, whilst others are at home.

In gardens it is an easy matter to make the soil to suit the crop—thus peaches and nectarines will not succeed in heavy wet soil, so drainage is a necessity, while deep planting is an error; to such soils add burnt refuse or charcoal refuse, road scrapings from limestone roads, old mortar rubble, or anything that lightens, placing the rougher materials at the base of the roots. Avoid mixing with the soil quantities of animal manures with trees of any size, but if the staple soil be at all poor one may add old cucumber or melon beds and spent mushroom-bed manure, but young trees are best without these aids if the soil is fairly good or a little new material can be given at planting. Firm planting is a necessity, and it will be well to keep all roots well spread out horizontally, using some of the surface soil for the smaller roots. Do not expose the roots to the air longer than possible, and if dry when received give a good soaking previous to planting. Mulch as the work is done, using any light manure that will not keep the soil cold and wet.—G. WYTHES, *Syon Gardens.*

DENDROBIUM SANGUINEUM.

THIS is a charming species of slender growth, and bearing large sanguineous-red flowers, which are remarkable for the relatively small size of the lip. The terete channelled pseudo-bulbs are uninterrupted along their lower portion, but the upper part is very slender, and here the flowers are borne, apparently only produced singly, as will be seen in the accompanying illustration. The flowers are about an inch and a-quarter across, with almost equal sepals and petals. The colour is distinct among dendrobiums, being deep Venetian red, with a creamy shade at the base of each segment; the small and pointed lip is also of a deep red hue. The leafage of this distinct species is very slender, linear, and about three inches long. Dendrobium sanguineum will be welcomed alike by the orchid grower and the hybridist for its distinct, rich, and beautiful colouring. A specimen shown by Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., on September 6 last gained an award of merit from the Orchid Committee of the Royal Horticultural Society.



DENDROBIUM SANGUINEUM.

The "Botanical Magazine" for November contains admirable portraits, in colours, of Astragalus ponticus, a curious légume with close axillary heads of yellow flowers; Kniphofia longicollis, a species from Natal, and closely allied to K. aloides, it has a dwarf habit and yellow flowers; Aloe leptophylla, a handsome Cape species, with variegated leaves and heads of bright orange-yellow flowers; Podotheca chrysantha, a curious composite from Western Australia, bearing terminal heads of yellow florets; and Calliandra fulgens, a handsome légume producing large blood-red heads that are composed principally of long and showy stamens.

A FURTHER GLIMPSE AT FRIAR PARK.

ALL those who have had the privilege and pleasure of a visit to the charming country residence of Frank Crisp, Esq., F.L.S., readily acknowledge that Friar Park, Henley-on-Thames, is one of the most interesting of horticultural establishments. It is a garden wherein the broad horticultural tastes of the owner are evidenced on all sides by the different phases of gardening met with, and yet also one wherein the special taste of the proprietor has been given full play without detracting from aught else. Readers of the GARDENERS' MAGAZINE are already familiar with some of the beauties and wonders of Friar Park, for in the issue of July 9 last a descriptive and illustrated account of them was given. In the present issue two other reproductions from photographs are given, one representing the view to be obtained from the terrace in front of the mansion, and the other showing the newer and larger portion of the magnificent rock garden.

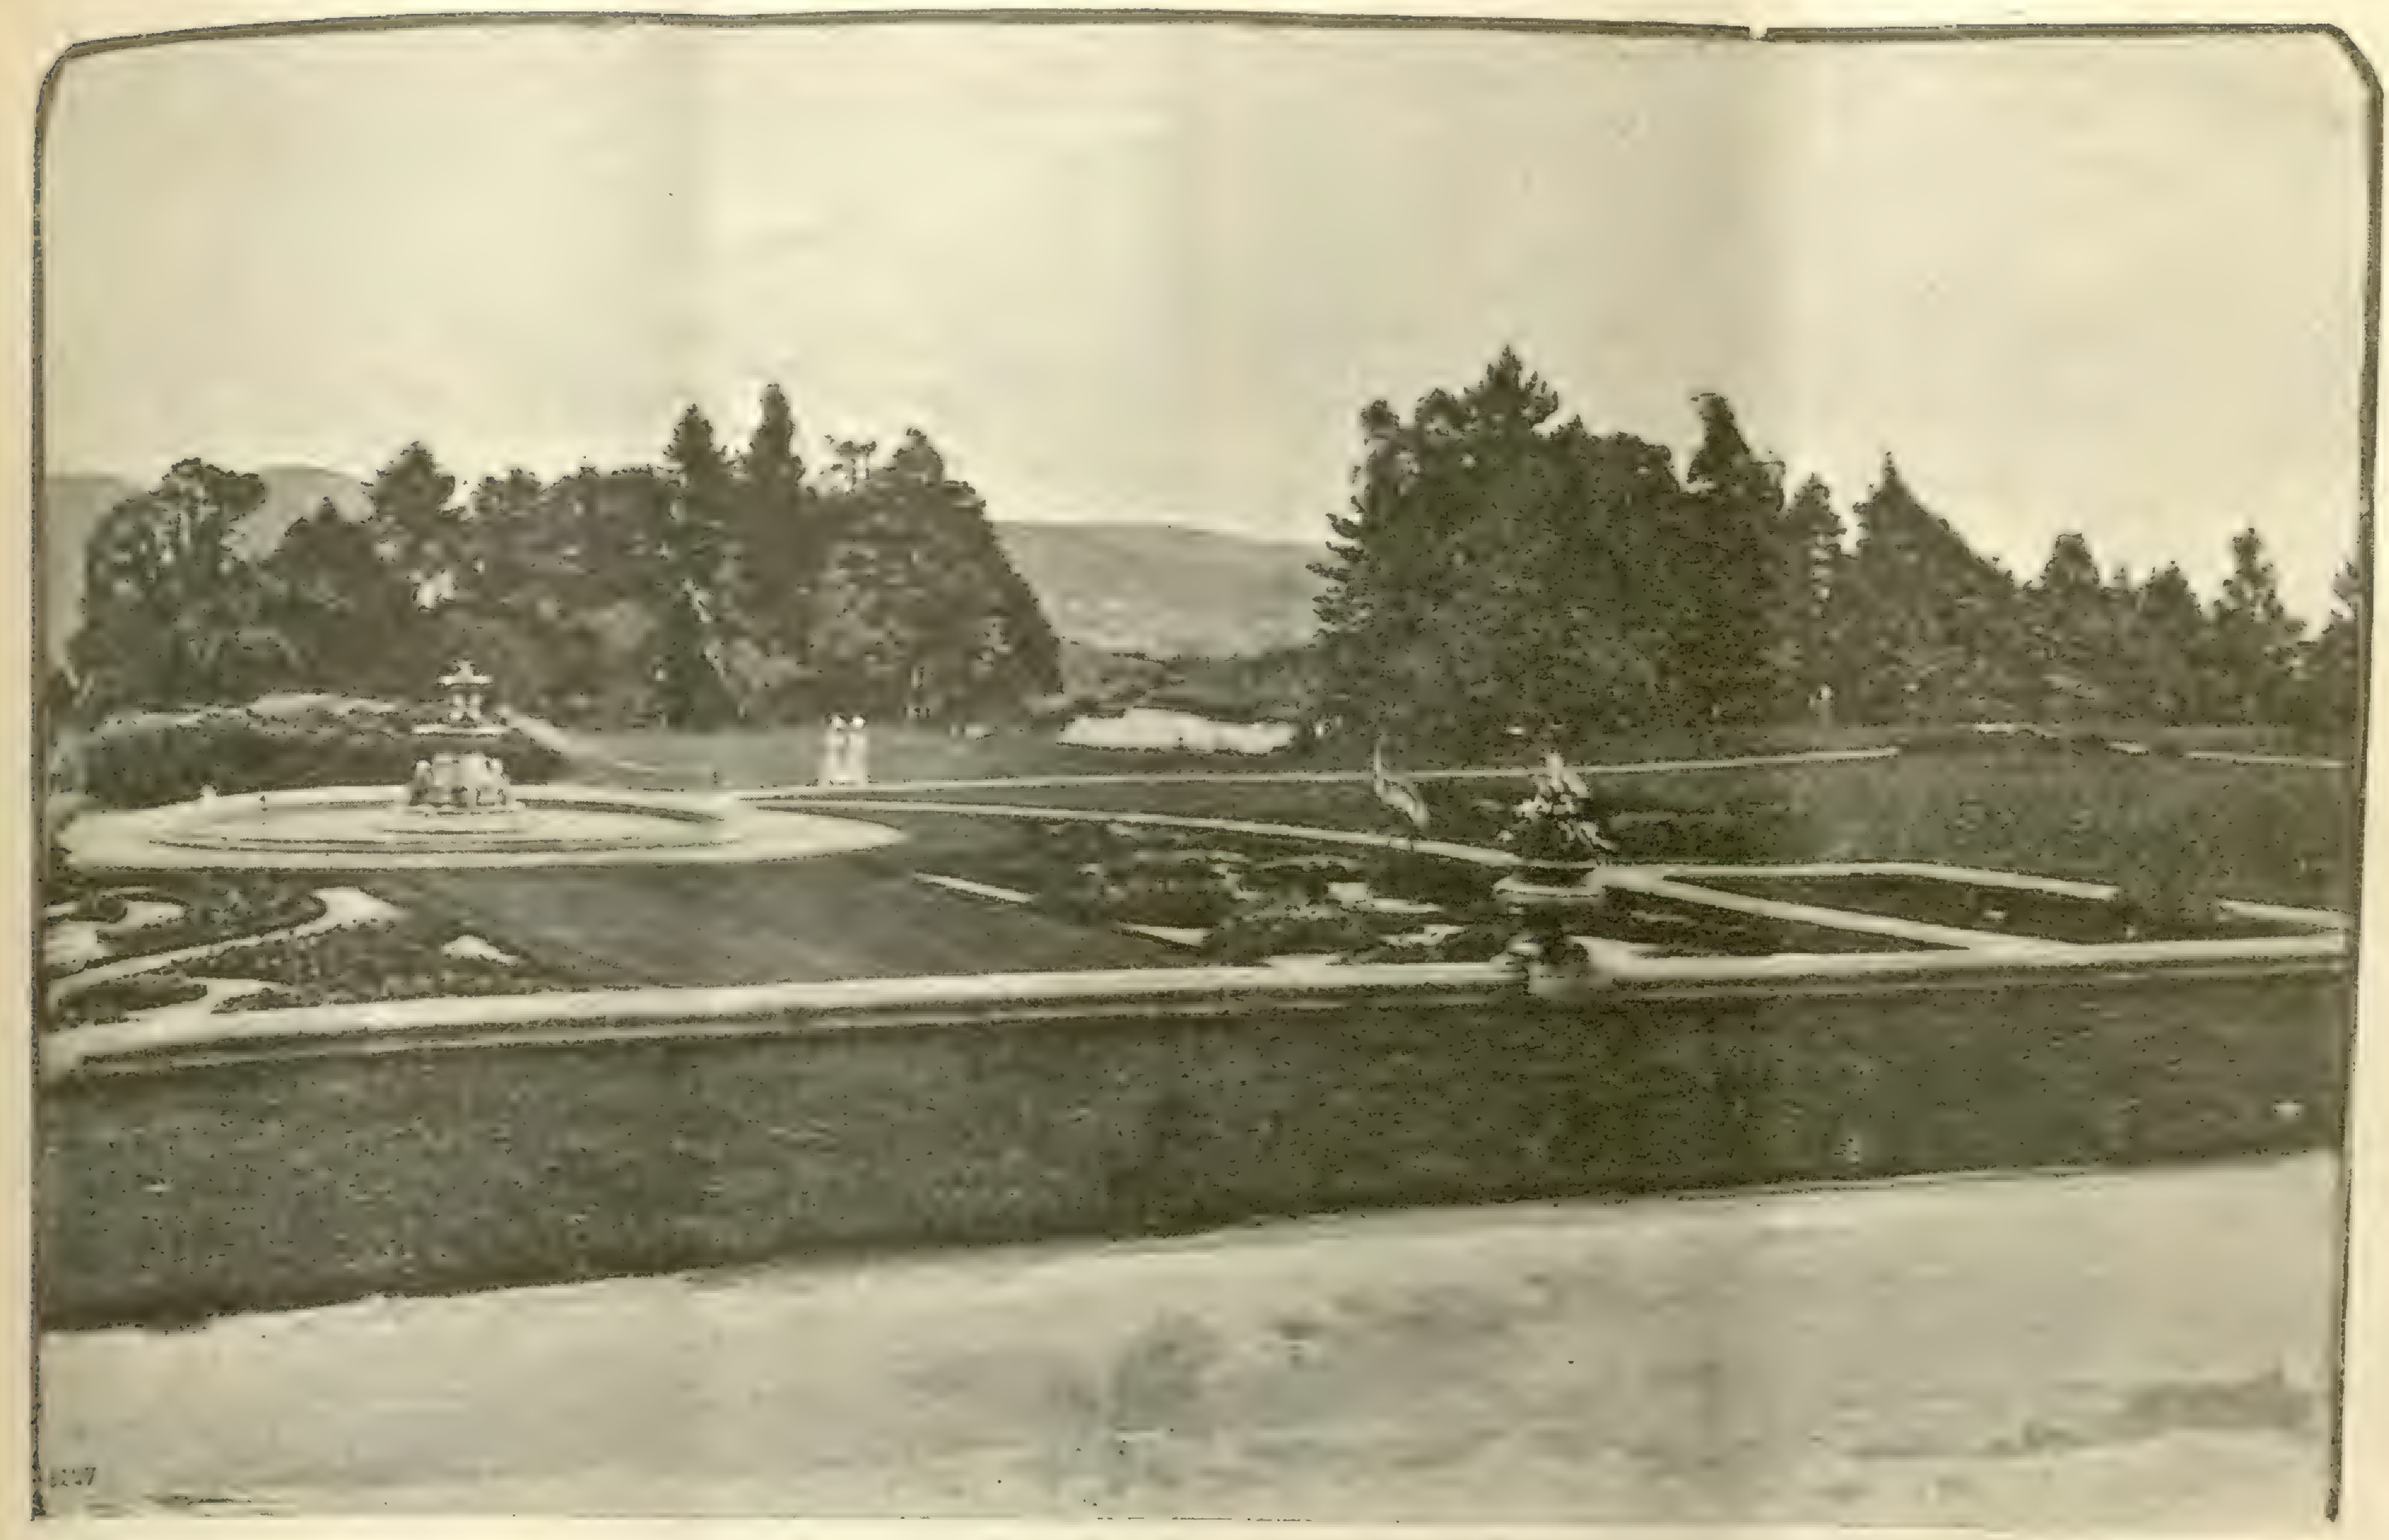
Did Friar Park contain nothing else of horticultural merit besides its rock garden, it would still be entitled to a large share of fame, and during spring and summer would draw many visitors who have a special love for dainty alpines, and even the more robust plants that delight to grow amid, upon, and over rocks. The highest and boldest portion of the rock garden, also the newest, was constructed and planted by Mr. P. O. Knowles, Mr. Crisp's able gardener and steward, and is of quite recent date; indeed, a few finishing touches have been given during the present year. Many of the huge boulders weigh five tons each, and the largest of all weighs over six tons; several of these masses of soft stone are massed picturesquely together at the highest point in the rock garden, and over one very broad rock that is kept in place by the superincumbent weight of others a broad sheet of water falls into a pool below, and thence hurries down the irregular channel, tumbling in tiny cascades over numerous obstructing rocks of various size, till at last it reaches the pool in the valley, and finally is conveyed underground to feed the lake in a lower part of the grounds. This upper sheet of water is depicted in the accompanying illustration at the apex of the central rocky eminence, and some idea of the size of the rockery will be gained when it is remembered that under the overhanging rock and behind this miniature Niagara there is ample room for three or four persons to stand without getting wet, and even if you are six feet high you may stand upright without bumping your head.

Mr. Knowles has been most successful in designing this part of the rock garden, and not only has he produced a bold and pleasant effect, but has so planned the whole that no part is out of reach, as flat rocks are embedded so as to form stepping-stones, and yet so as not to interfere with the general mountainous effect. One of these mountain paths leads right to the summit, and behind the sheet of water that falls over the broad rock already referred to. From this point of vantage a splendid view over Maidenhead and away to the Chiltern Hills is obtained, while at one's feet the huge rock garden is spread out as a panorama. The purple thyme, golden sedum, blue campanula, and yellow Tropæolum polyphyllum are grandly effective as seen from above during the summer time, the latter plant being more beautiful here than I have ever seen it elsewhere. Dotted about down the mountain side are small but choice conifers, such as Abies balsamea, Juniperus canadensis aurea, Pinus strobus, P. sylvestris, Abies pygmæa, A. procumbens, A. Remonti, and several dwarf kinds of thuias and retinospora. Opposite this eminence is another, consisting of an almost sheer face of rock surmounted by Abies Douglasi and A. Nordmanniana; to understand fully the amount of work this piece entailed, one has to leave the rock garden for the lower grounds and look back, when it will be found that an immense mound was raised and planted with pines and abies to block out a certain view. This mound is supported on the other side by the face of rock just instanced.

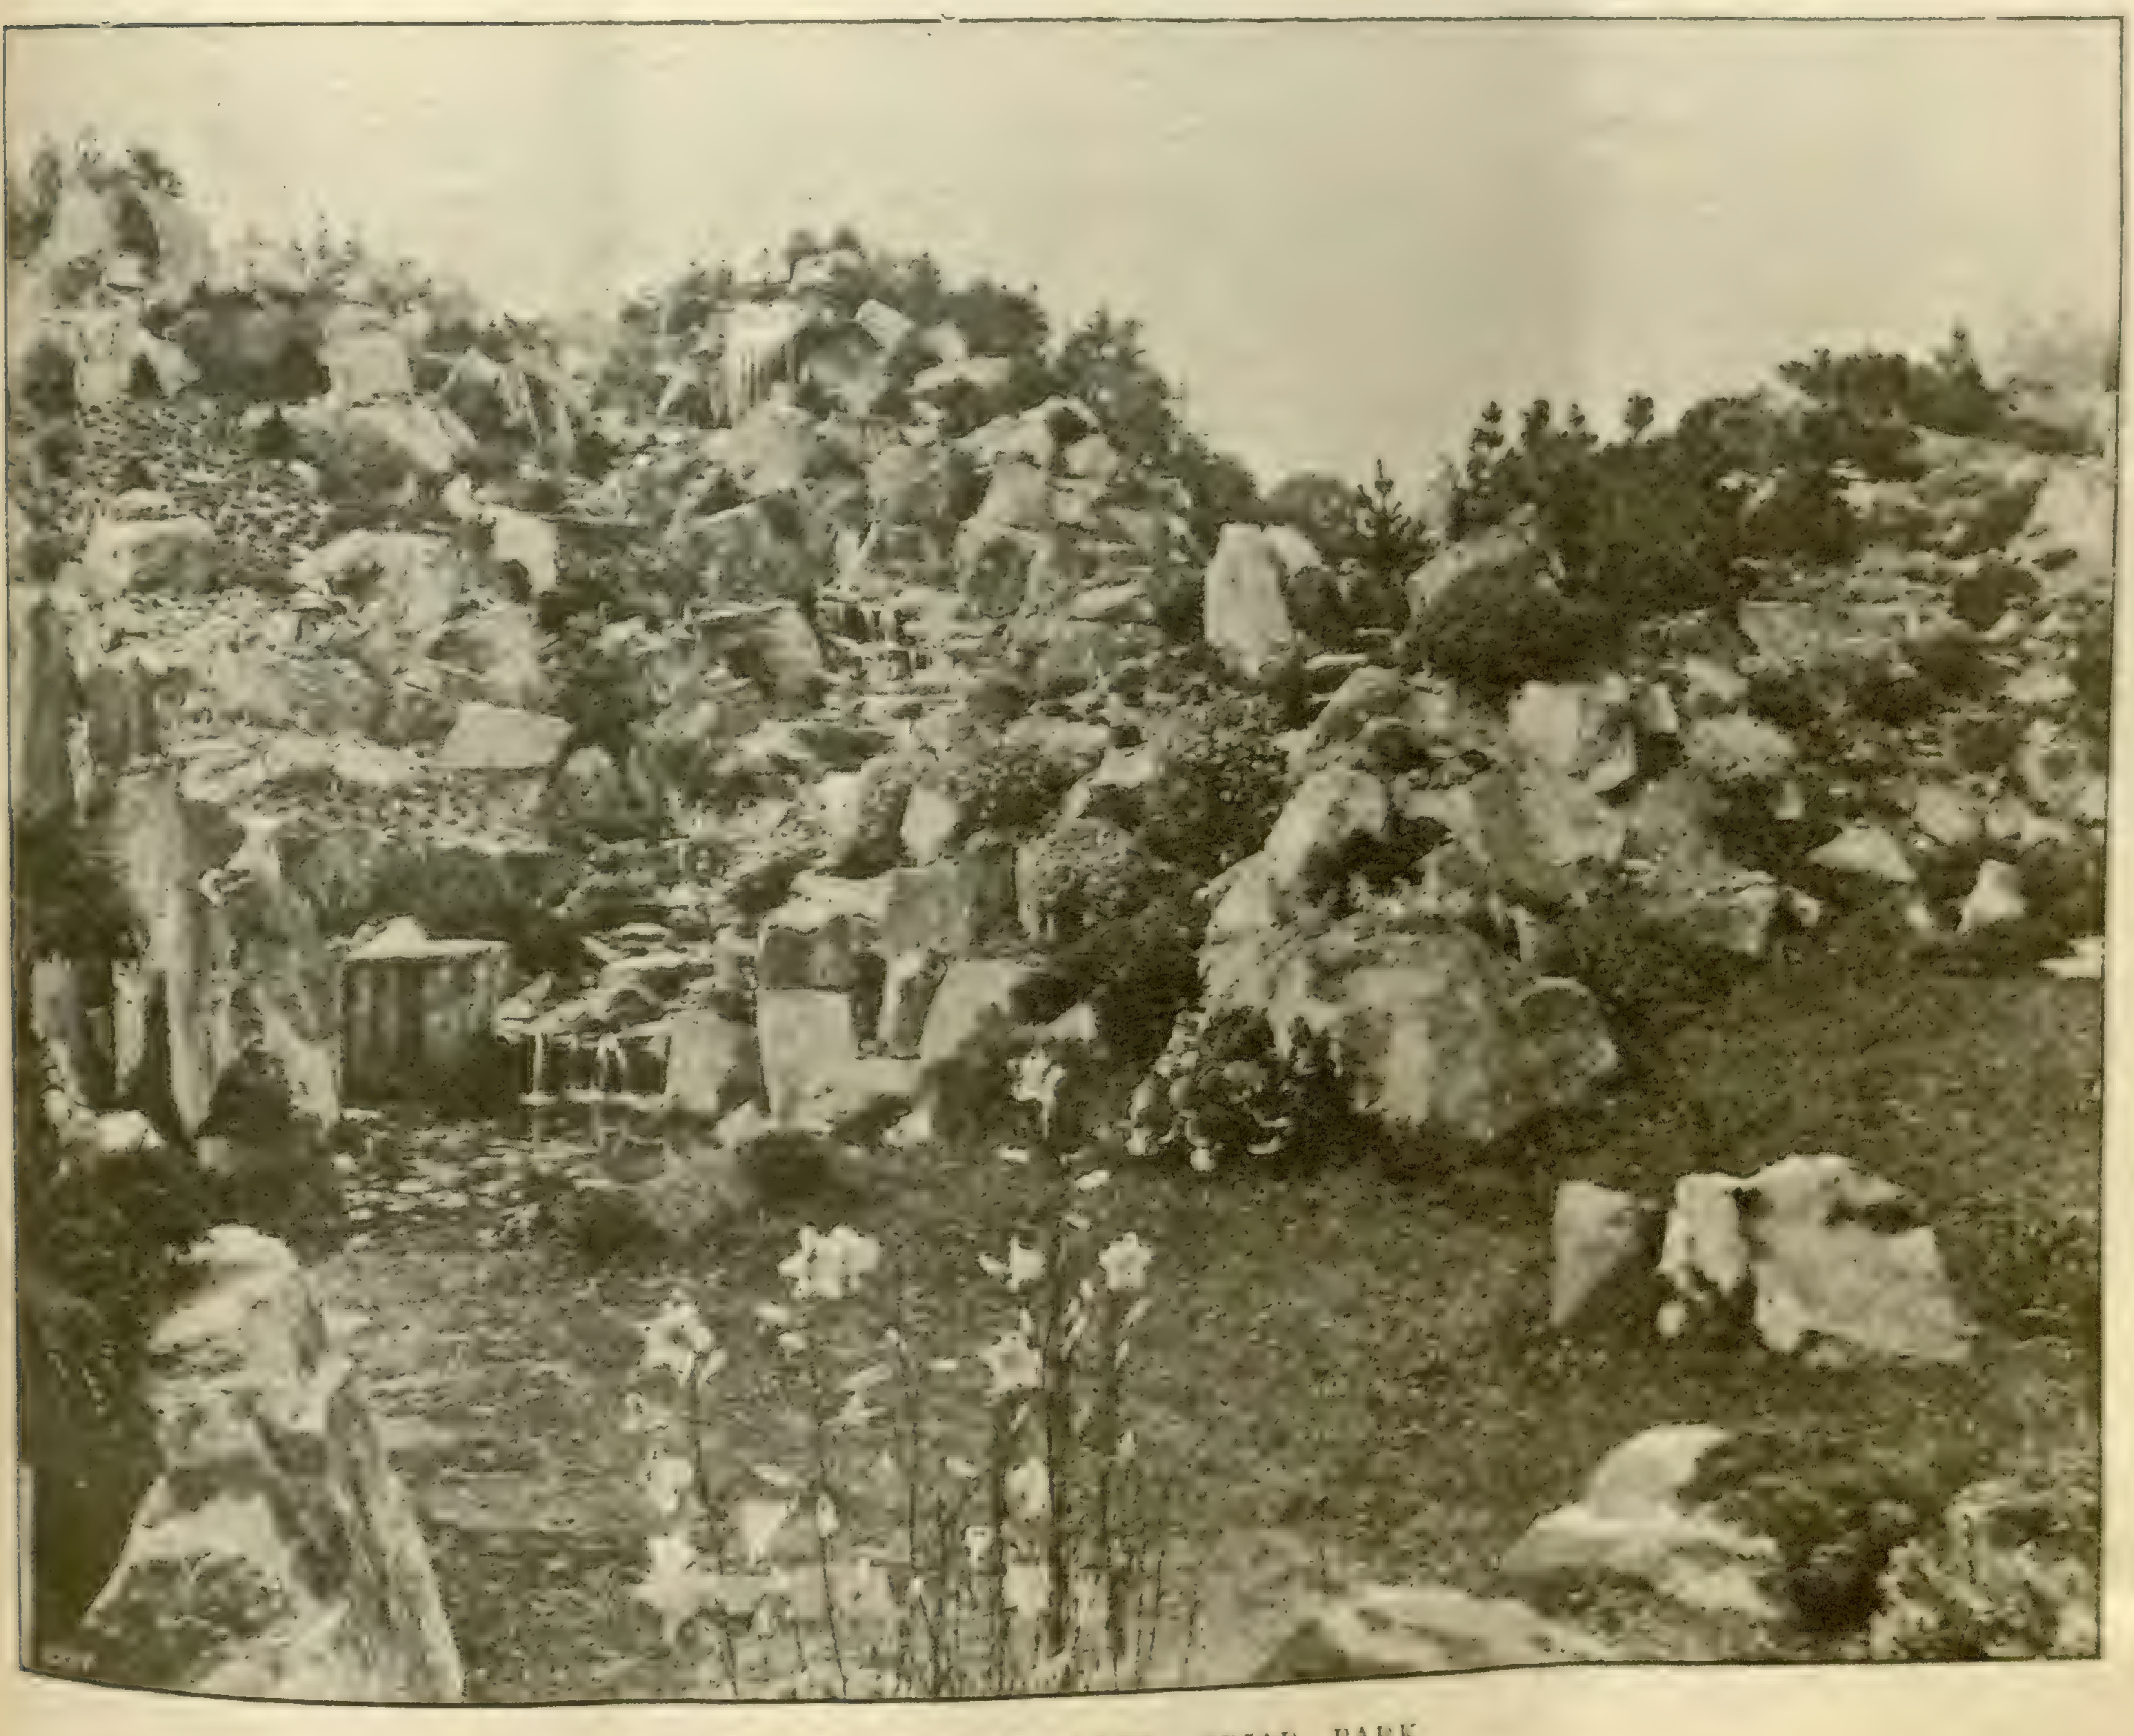
Along the side of the mansion that faces the River Thames there is a broad, raised terrace, and just below the terrace is a garden in the old formal Dutch style, the beds being edged with box and parted from each other by areas of spar. Some of the beds are planted with permanent subjects, such as Daphne Cneorum, Erica Foxi, Gaultheria procumbens, &c.; while others are filled during the summer time with semperflorens begonias, or tricolor pelargoniums. A pair of storks in this garden—well-designed figures—add to the general effect desired, that of an old Dutch garden, and these can readily be distinguished in the illustration of the view from the terrace. Below the Dutch Garden broad stretches of lawn slope away towards the lake and the small woods on either side; these again combine in the landscape with the wooded valley of the Thames towards Marsh Lock, while in the distance a pretty curve of the river is plainly to be seen when the sun lights up the water.

To the left of the Dutch Garden, and at some little distance from it, there is a fine Pine Walk, of considerable length, straight, and sloping towards the river. This passes under two even rows of healthy spruce and Pinus sylvestris. For the moment one is reminded of breezy Bournemouth and its pine-woods. Passing through the lavender garden, that has been deliciously fragrant, the rose and herbaceous garden is reached. Here the more popular herbaceous plants bloom profusely in their season. Light iron and wire archways run through the centre, and these are covered, or nearly so, with beautiful roses; the Penzance briars were a glorious sight, gay and fragrant during the past summer, while Crimson Rambler provided a glorious blaze of scarlet, and Cheshunt Hybrid bore a profusion of its lovely and sweet-scented blooms, that threatened to pull the plant from its support by their weight.

Mr. Crisp loves his Garden and shows his love by his keen interest in it and the liberal manner in which he provides for its wants, and thus encourages the skill and energy of his clever gardener. Although previously stated, it will bear repeating that Mr. Crisp opens Friar Park to the public one day a week. Sixpence per head is charged for admission, and half the total proceeds go to local charities, the other half going to the Gardeners' Royal Benevolent Institution. C. H. CURTIS.



DUTCH GARDEN AND VIEW FROM THE TERRACE AT FRIAR PARK.



VIEW IN THE ROCKERY, FRIAR PARK

EXHIBITIONS AND MEETINGS.

ASCOT, November 2 and 3.

THE fifteenth annual show of chrysanthemums, fruit, and vegetables was held at the Grand Stand—about the best place for a show in the kingdom; but this year there were very few exhibits. Blooms are late in this neighbourhood, and not up to the standard of late years in size and colour. The group classes were fairly well represented, and hardy fruit and vegetables very good. In the class for twenty-four Japanese there was one entry, and for twenty-four incurved not one, yet in previous years these two classes have been contested by some of the leading exhibitors. This season Mr. W. L. Farmer, gardener to H. P. Lachelles, Esq., the Highams, Bagshot, was awarded second prize for a nice clean set of twenty-four Japanese. For eighteen incurved and eighteen Japanese Mr. W. Lane was first with very good flowers, his Japanese varieties being Mrs. W. H. Lees, Australie, Oceana, Beauty of Teignmouth, International, Edna Ross, Boule d'Or, Mrs. J. Lewis, J. Chamberlain, Snowdon, Phœbus, Commandant Blussett, Emily Silsbury, Mrs. G. L. Beer, Mrs. Main, Lady Hanham, Madame Carnot, and C. Davis; incurved—Lord Wolseley, J. Agate, Lady Isabel, Duchess of York (grand), Globe d'Or, Prince Alfred, Mrs. R. C. Kingston, Baron Hirsch, C. H. Curtis, Mrs. J. Murray, Queen of England, Madame Darrier, Martagon, Mr. J. Kearne, Brookleigh Gem, Jeanne d'Arc, E. Cannell, and Rosa Owen. Mr. W. Farmer, gardener to H. P. Lachelles, Esq., second, but only two points behind the first. For twelve incurved Mr. W. Wilson, gardener to R. C. Christie, Esq., Ribsden, Bagshot, showed fine blooms; the same was also first for twelve Japanese, there being but one entry.

For six white Japanese, one variety, Mr. Farmer was first with Miss Mary Lachelles, a promising seedling For half a dozen blooms of any other colour Mr. Wilson was first with Edith Tabor, while the same grower had the best six incurved with C. H. Curtis, Mr. Farmer second with the same variety. For twelve blooms shown as grown Mr. Wilson was first with good flowers.

For a circular group eight feet in diameter, chrysanthemums and foliage plants mixed, there were four competitors. Mr. Farmer was a decided first; Mr. J. Edge, gardener to Lord Harlech, Tetworth, Ascot, second; Mr. J. Cowie, gardener to Sir Thomas Lucas, Bart., Ascot, third. Three did battle for the best group of chrysanthemums, and Mr. H. White, gardener to the Marchioness of Conyngham, The Mount, Ascot, was a good first; Mr. Lane, gardener to Miss D. Smith, King's Ride, Ascot, second; Mr. A. Hawthorne, gardener to Messrs. Blair and Shackle, The Schools, Ascot, third. Mr. Edge was first for a group of miscellaneous plants, but not bright enough for this time of the year. Mr. Farmer was first for six table plants and Mr. White for six pots of grand violets.

Messrs. Farmer and Wilson were first in the apple and pear classes, while Mr. Lane was easily first for nine and six dishes of vegetables.

WIMBLEDON, November 9 and 10.

AN extremely pretty little show was held on the above dates at the Drill Hall, a very suitable place for a chrysanthemum exhibition. If the cut bloom classes were scarcely so well filled as on some previous occasions, the principal group class amply made up for any other deficiencies; indeed, it is very seldom that such a splendid lot of groups are to be seen at what is almost a purely local show. The arrangement of the groups all along one side of the hall leaves something to be desired, as a better distribution would add considerably to the spectacular effect of such a show. The general arrangements were good and the judging done to time.

There was an exceptionally keen competition in the class for a group of chrysanthemums arranged on a space of forty square feet. The chief award was a silver cup, offered by the tradesmen of Wimbledon, and this was secured by Mr. J. French, gardener to Mrs. Barclay, Ambleside, Wimbledon Park, who had a most effective display of well-grown and well-flowered chrysanthemums; his Madame Carnot, Phœbus, Madame Gustave Henry, and C. H. Curtis were especially attractive. There were six competitors in this class, so the effect the groups had along the big Drill Hall can well be imagined. Mr. J. Martin, gardener to Colonel Mitchell, Canizaro House, Wimbledon Common, won second prize; his flowers were splendid and his plants dwarf, and a little more care in effective arrangement would have secured him the first prize. Mr. A. Newell, gardener to Sir E. Saunders, Fairlawn, Wimbledon Common, was a good third; Mr. T. Chandler, gardener to the Rev. Canon Haygarth, fourth; while to Mr. Thornton an extra award was made.

In the smaller class the chief award was won by Mr. C. Pullen, gardener to G. Fores, Esq., Raynes Park; Mr. F. Chandler, gardener to Mrs. Wilson, St. Mary's Road, second. For a miscellaneous group the first prize was awarded to Mr. A. Newell, who had a pretty display of dracænas, crotons, palms, Begonia Gloire de Lorraine, and scarlet bouvardias; Mr. McGregor, gardener to the Dowager Lady Hay, North House, Putney Heath, was placed second, and Mr. F. Chandler third.

The society's special prize for three dozen blooms, half incurved and half Japanese, was won by Mr. J. Hunt, gardener to P. Ralli, Esq., Epsom, who showed the following Japanese varieties in good condition: Mrs. J. Lewis, Mrs. N. Molyneux, E. Molyneux, Graphic, Ella Curtis, Australie, Mrs. Carrington, Edith Tabor, Mrs. R. Jones, Mrs. Herman Kloss, Simplicity, Mons. Panckoucke, Phœbus, Lady Ridgeway, M. M. Ricoud, Louise, Modesto, and Eva Knowles. The incurved varieties were Empress of India, J. Salter, C. H. Curtis, Ma Perfection, Globe d'Or, Duchess of Fife, Mrs. Coleman, Lord Alcester, R. Petfield, W. Tunnington, Golden Empress, J. Doughty, R. Cannell, Princess of Wales, Bonnie Dundee, Miss M. A. Haggas, Violet Tomlin, and J. Lambert. Mr. C. Gibson, gardener to J. Wormald, Esq., Morden Park, Mitcham, was placed second.

Mr. Hunt was also first for twelve blooms each of Japanese incurved varieties, showing fine flowers of Mrs. J. Lewis, Mrs. N. Molyneux, Eva Knowles, Modesto, Mrs. R. Jones, M. M. Ricoud, Ella Curtis, Australie, Edwin Molyneux, Louise, Niveus, and Phœbus as Japanese; C. H. Curtis, Lucy Kendall, Miss M. A. Haggas, Ma Perfection, J. Lambert, Violet Tomlin, Globe d'Or, Duchess of Fife, Lord Alcester, Mrs. Coleman, Golden Empress, and Empress of India, incurved; Mr. C. Bentley, gardener to Major Bosworth, Cedar Court, Roehampton, second. Mr. Balton, gardener to Lord Tankerville, Kingston, won Mr. H. J. Jones's prize for six blooms Japanese. In the open class for six Japanese, distinct, Mr. W. Brett, gardener to W. M. Campbell, Esq., Coombe Ridge, Kingston, was first prize winner. Mr. Brett also showed the best six incurved blooms, good flowers of Miss V. Foster, Duchess of Fife, C. H. Curtis, Princess of Wales, and Miss D. Foster.

Mr. Brett was first for twelve Japanese, distinct, putting up very fair examples of Viviand Morel, Western King, Modesto, Madame Carnot, Australie, Simplicity, Duke of York, Mrs. W. H. Weeks, Edith Tabor, Reine d'Angleterre, and Phœbus; Mr. A. Skeggs, gardener to Mrs. Dann, Copse Hill, second: there were six stands staged. Mr. Brett was first for a dozen incurved, distinct, with large flowers of Austin Cannell, Queen of England, J. Salter, Topaze Orientale, Miss D. Foster, Jeanne d'Arc, Miss F. Foster, C. H. Curtis, Brookleigh Gem, Duchess of Fife, Lucy Kendall, and Miss M. A. Haggas; Mr. J. French, second; and Mr. C. Bentley, third. Mr. J. Wright, gardener to Colonel Tuffnell, Wimbledon Park, had the best pompons. Mr. Brett was first for six Japanese blooms, one variety, with good Madame Carnot; Mr. Puxted second with the same variety, and Mr. Hawkes third. Mr. C. Taylor, Belmont Gardens, Wimbledon Park, showed the best basket of chrysanthemums, using the spidery Mrs. Filkins and similar varieties; Mr. C. Pullen second with a bolder basket. For a tastefully-arranged basket of plants Mr. W. Thornton, gardener to F. E. Crocker, Esq., Draxmont, won Mr. R. Dean's prize with single chrysanthemums, cattleyas, nerines, &c.; Mr. H. Woodgate, Clapham Park, second.

Mr. J. Puxted, gardener to J. H. Boobbyer, Esq., Mitcham, showed the best primulas, Mr. F. Chandler the best solanums, Mr. T. H. Bolten the best table plants, and Mr. C. Taylor the best capsicums.

Mr. R. Clarke, gardener to J. L. Densham, Esq., Waldronhyrst, Croydon, was a good first for white grapes with White Tokay, and Mr. Brett second, with Muscat of Alexandria. For black grapes Mr. Clarke scored with Black Alicante, while Mr. C. Bentley came second with Gros Maroc. For dessert apples, Mr. C. Taylor was to the fore; while for culinary varieties Mr. F Stephens, gardener to G. H. Peck, Esq., Phipp's Bridge, was first. Mr. C. Taylor also had the best pears. Mr. Bentley scored for vegetables, Mr. Pullen coming second.

HIGHGATE AND DISTRICT CHRYSANTHEMUM SOCIETY, November 8, 9, and 10.

THIS enterprising society has always taken a high position in promoting the cultivation of the "Autumn Queen," more particularly in the neighbourhood of the northern heights of London. For years its efforts have been considerably hampered, because of the committee being unable to find a building in the immediate neighbourhood of Highgate adequate to meet their demands, and for this reason a move was made nearer town, to the Holloway Hall—a well-known north London public building. Commodious as this building is, it was taxed to its utmost capacity to find accommodation to display to anything like advantage the numerous exhibits of high quality which represented the fourteenth annual exhibition.

For a group of chrysanthemums to cover sixty square feet, to be edged with foliage plants, Mr. J. Brooks, gardener to W. J. Reynolds, Esq, J.P., The Grove, Highgate, was an easy first with heavy flowers, Mr. G. Saunders, gardener to W. Hayes, Esq., Gloucester House, Highgate, being a poor second. For a group of chrysanthemums and foliage plants, arranged in semicircular form, sixty feet square, Mr. J. Brooks was again a good first. This exhibit was a special feature of the show, and was remarkable for the high quality of its flowers, charming arrangement of colour, and a pleasing blending of foliage plants. Second prize was awarded to Mr. J. Tubbs, gardener to H. G Regart, Esq., Highgate Lodge, Highgate, also for a pleasing arrangement, but with flowers of less quality. Six trained specimen plants again found Mr. Brooks leading with plants hardly up to this grower's usual standard, yet very pretty and freely flowered. His best plants were Miss Watson, a good yellow Japanese, Mdlle. Bertier Rendatler, Colonel W. B. Smith, and an incurved in Mrs. Dixon. The system of tying was all that could be wished for. For six trained specimen pompons, distinct, Mr. Brooks secured premier position with freely-flowered plants, somewhat spoilt by a too stiff tying, yet very fresh and good; particularly good were William Westlake, President, and Adonis. A good second was found in Mr. F. Gilbert, gardener to W A. Sewell, Esq., Shepherd's Hill, Highgate, with three charming plants of Marie Stuart, William Westlake (very fine), and William Holmes; the remaining three plants unfortunately fell short of the standard set up in the others. Mr. J. Brooks again triumphed in the class for a single specimen, staging a magnificent plant of Mdlle. Bertier Rendatler, followed by Mr. Gilbert with Lady Selborne; Mr. Saunders with Maiden's Blush was third.

The principal cut bloom classes were well contested, and the blooms would bear favourable comparison with most of the leading shows. Mr. J. Brooks (a nephew of the plant grower), gardener to W. J. Newman, Esq., Totteridge, Herts, won the silver cup, value ten guineas (for the second time, and, therefore, absolutely now), for forty-eight Japanese blooms in not less than twenty-four varieties, staging fairly good blooms of Oceana, M. Chenon de Leche, Monsieur Hoste, Edith Tabor, George Seward, Lady Hanham, Phœbus, Madame E Rosette, Van den Heede, Mutual Friend, E. Molyneux, Pride of Madford, and Australie (very fine). For thirty-six blooms, eighteen incurved and eighteen Japanese, each distinct, Mr. A Jones, gardener to Miss Wyburn, Hadley Manor, Barnet, was a good first with fairly neat and even incurved blooms, these being represented best by Miss Dorothy Foster, Mrs. R. C. Kingston, Violet Tomlin, Madame Darrier, Jeanne d'Arc, Princess of Wales, and Chas. H. Curtis. Of the Japanese his best were Madame Carnot, Eva Knowles (very fine), Louise, Chas. Davis, Mons. Geo Biron, Mutual Friend, Mrs. C. Harman Payne, and Madame Gust. Henry. The class for twenty-four Japanese, not less than eighteen varieties, brought forth five competitors, and this was one of the finest displays in the exhibition. The place of honour was taken by Mr. J. Brooks, Totteridge, with an admirable lot of blooms, remarkable flowers of Australie, M. Chenon de Leche, and Mrs. Maling Grant standing out conspicuously; others a trifle less in point of quality being J. Brookes, Mons. Hoste, Viviand Morel, John Neville, Surprise, Mrs. G. W. Palmer, and Duke of Wellington. This exhibit also gained the society's special certificate. A pretty lot of flowers from Mr. J. Sandford, gardener to G. W. Wright-Ingle, Esq., Wood House, North Finchley, secured second prize. A class for twelve blooms, pure yellow Japanese, produced a spirited competition. Mr. Brooks, Totteridge, was again first, having triplets of Phœbus, Modesto, Oceana, and another; Mr. Sandford was a good second, and Mr. A. Page, gardener to A. L. Reynolds, Esq., North Finchley, third. A grand lot of flowers in the class for twelve Japanese, distinct, were forthcoming, Mr. Brooks, Totteridge, again being invincible with M. Chenon de Leche, Australie, Pride of Madford (very fine), Mrs J. Lewis, G. C. Schwabe, Simplicity, and E. Molyneux well represented; Mr. Sandford secured second position with a much weaker set, and Mr. J. Brooks, Highgate, third. A pretty class was one for six white Japanese, distinct, Mr. Brooks, Totteridge, having chaste and large flowers of Madame Carnot, Mrs. H Weeks, Simplicity, Feu de Champsaur, Mdlle. Thérèse Rey, and Madame Ad. Moulin; Mr. A. Jones was second. For six Japanese, white varieties excluded, Mr Sandford proved victorious with six of the finest blooms of Mons. Chenon de Leche we have seen; they possessed colour, substance both in petal and build, and breadth of petal, and were ideal flowers of that unique sort. A good second was found in the Totteridge Mr. Brooks, with superb examples of Mons. Hoste. A class at this show, and of special interest, is that for a single specimen Japanese bloom. This secured for Mr. Sandford first prize with a grand bloom of Mrs. H. Weeks, Mr. Brooks following with a phenomenal Australie of high quality.

Incurved varieties were here and there seen in pleasing form and neat finish, but, taken as a whole, they were rather rough and uneven in finish. For twelve blooms (six varieties) Mr. A. Jones secured first prize, his best being Lucy Kendall, Charles H. Curtis, Madame Darrier, and Mrs. R. C. Kingston; the remaining three competitors were decidedly weaker. With six handsome blooms of Charles H. Curtis, Mr. A. Jones won the first prize for six incurved, one variety only, smaller blooms of the same variety securing second position for Mr. M. Roe, gardener to Colonel Wilkinson, Highgate, and third prize to Mr. J. Tubbs with Baron Hirsch. Eight entries were staged in this last competition. In a class for twelve anemones (large-flowered) three capital stands were staged, leading honours falling to Mr. Sandford with a very pretty and even lot of flowers. Specially noticeable were Madame Lawton, John Bunyan, Fabian de Mediana, Delaware, and Descartes; second prize being secured by Mr. Spacey, gardener to H. Ward, Esq., Finchley, John Bunyan and Sir Walter Raleigh being his best flowers; and Mr. A. Page a close third.

Pompons are always staged in excellent condition at this exhibition, and exceedingly pretty were they, and admirably staged. Mr. T. L. Turk, gardener to T. Boney, Esq., Highgate, is invincible in this department, his stand of twelve triplets, which occupied the leading position, being notable for ideal blooms of Maid of Kent, President, Mr. Holmes (lovely colour), Comte de Morny, William Westlake (the best yellow), Adonis, Osiris (very fine), Mdlle. Marthe, and Mdlle. Elise Dordan. A capital second was found in Mr. E. H. Chitty, gardener to S. Hardy, Esq., Cholmeley Lodge, Highgate, lovely blooms of Francis Boyce (anemone pompon), William Kennedy, and Bessie Flight calling for special notice. A similar class in the single-handed gardeners' classes found these two enthusiasts occupying similar positions with very handsome flowers. A class deserving encouragement has been tried here for years with great success, and is for twelve cut blooms of chrysanthemums set up with ferns, grasses, and other foliage (in pot or cut), arranged for effect in a given space. This was very pretty, and was well contested. In this class Mr. J. Brooks, Totteridge, proved his superiority with a very light and pleasing association of foliage and grasses, and with handsome Japanese blooms; Mr. M. Roe was a good second, closely followed by Mr. A. Page. As mentioned earlier, the decorative classes were a pleasing and instructive feature of the exhibition; epergnes, hand baskets, bouquets, sprays, and buttonholes, vases in great variety, and autumn foliage and berries arranged in baskets, occupied a great amount of tabling, but want of space prevents a descriptive notice of each. The chief prizes were gained by Mrs. Wheadon, Mrs. Halsey, Messrs. T L. Turk, E. H. Chitty, J. Brooks (Totteridge), G. Saunders, G. Partridge, and A. Page.

The amateur classes were well filled and contributed in no small measure to the interest of the visitors, the chief prizes being secured by Messrs. W. Timewell, Finchley; A. F. Bongard, East Finchley; F. J. Matthew, Muswell Hill; A. Taylor, and G. E. Willis, East Finchley.

Messrs. W. Cutbush and Sons, Highgate, had a pretty group of foliage plants and heaths, &c.; Messrs. B. S. Williams and Sons, Upper Holloway, also staging lovely group of foliage plants, orchids, &c., and a useful group of coniferous plants. We regret to see that this society has withdrawn from affiliation with the N.S.C.

BIRMINGHAM, November 8, 9, and 10.

THE show of chrysanthemums at Birmingham may fairly be described as the most important of the several good exhibitions held in the Midland counties, and the society having the advantage of the large and commodious Bingley Hall in which to hold its shows is enabled to arrange the grand displays of flowers and fruit to the best advantage. The liberal prizes offered in the opening classes are the means of attracting a splendid competition amongst the best cultivators from various parts of the country, equally in the fruit as in the classes for chrysanthemums The rise and fall of champion growers both of past and present times have been witnessed on the scene of these encounters, and accounts of the show are always interesting to those who cultivate these flowers. The fine effect produced by the groups and trained plants is scarcely equalled anywhere, and this year an interesting exhibit of fruit and flowers was contributed from the Royal Gardens, Windsor, by Mr. Owen Thomas. The pines and various hardy fruits are first-rate and pleasingly arranged amongst autumn foliage and chrysanthemums, a fine lot, the lovely Princess of Wales violet being also disposed round the margin of the table.

Trade exhibits were a fine feature. Messrs. Sutton and Sons, Reading, occupied one hundred feet of tabling with a fine lot of their specialities in cyclamen, gesnereas, fibrous begonias, &c., and a grand collection of potatos. The firm has been awarded two gold medals for this splendid exhibit. Messrs. J. Laing and Sons, Forest Hill, had a very important show, fine fruits of apples and pears being the chief part and for which the firm is justly famous. The competition in the fruit was most keen, and of the highest excellence; grapes were far superior to shown at Sydenham in September, including huge bunches of Barbarossa weighing about eight or ten pounds, and grandly coloured Muscats. The show is ly, as a whole, the most comprehensive held at this season of the year.

The leading class in the prize list is for a display of floral arrangements. Mr. Crooke, Edgbaston, first, and Messrs. Pope and Sons, Birmingham, second, with very fine floral designs The tables of British-grown fruits to occupy square feet included some magnificent exhibits, Mr Mullen, gardener to H. Somerset, coming first with huge clusters of Muscat and black grapes, apples and pears, peaches, cherries, currants, plums, damsons, &c; Mr. acre, Elvaston Castle, second with a scarcely less inferior exhibit, including of the finest hardy fruit in the show, but less variety than in the first prize

The classes for nine plants of chrysanthemums were well filled and made a good feature, though the blooms were scarcely so fully developed as usual at this show. The classes for groups were as attractive as possible, there being ten exhibits. were exceedingly well done and artistic arrangements. Mr. Menzies, gardener to R. Cadbury, Esq., Moseley, was first with a splendid blaze of colour, yet a light arrangement of chrysanthemums and fine foliage plants; Mr. McDonald, gardener to J. H. Kenrick, Esq., Edgbaston, second.

The rivalry in the cut bloom classes was well sustained, and these formed, as usual, the centre of interest. In the class for twenty-four incurved, Mr. C. Crooks, gardener to Lady Hindlip, Droitwich, was a grand first, showing in the best form Duchess of Fife, Wm. Tunnington, Madame Ferlat, Major Bonaffon, Empress of India, Miss D. Foster, Topaze Orientale, Lord Alcester, Lady Isabel, Violet, John Lambert, Robert Petfield, Queen of England, Golden Empress, J., Brookleigh Gem, Miss Haggas, Mrs. Heale, Violet Tomlin, Jeanne d'Arc, Coleman, Princess of Wales, and Lucy Kendall; Mr. Goodacre, gardener to Harrington, second, and Mr. Foster, Havant, third. There were eight entries. Mr. Crooks was first in the other incurved classes for eighteen and twelve respectively, showing in first-rate form blooms of the same varieties included in the large class, and of largest size and perfect development. The class for twenty-four Japanese blooms resulted in eight entries, and though good did not equal the incurved in point of merit; the first prize was awarded to Mr. Pearce, gardener to S. Loder, Esq., Flore House, Weedon, his best blooms being Mrs. J. Lewis, Madame Gustave Henry, Madame Carnot, Lady Hanham, Mrs. Weeks, M. Massage de Louvrex, M. Chenon de Leche, N. C. S. Jubilee, Edith Tabor; Mr. Salter, gardener to T. B. Haywood, Esq., Reigate, was an exceedingly close second with bright fresh blooms of good colour and substance, including W. Seward, Chas. Davis, Viviand Morel, and Mons. Hoste; Mr. Lees third, and Mr. Crooks fourth. Mr. Sceany, gardener to E. S. Cope, Esq, Redditch, was first for eighteen Japanese; Mr. Jones, gardener to Smith Rylands, Esq., being second. The class for twelve Japanese was only moderately represented, and minor classes generally did not bring much competition. The new classes for cut blooms, arranged with long stems and suitable foliage, is a step in the right direction, but more liberal prizes are necessary to attract better competition; the exhibits were very pretty, and showed the true decorative value of large blooms

Primulas, though not so good as is usual at this show, were very largely exhibited, and sustained the reputation of the growers. There was also a good show in the vegetable classes.

WITNEY CHRYSANTHEMUM AND FRUIT SHOW, November 8.

THIS West Oxon society held its second exhibition in the Corn Exchange Buildings under most favourable circumstances, the weather being bright and the air warm and soft. There were seven groups for effect around the hall, the winner of the premier award and silver medal being arranged by Mr. W. Blake, gardener to Mrs. Worley, Field House, very attractive being the colossal blooms of Madame Carnot, Good Gracious, Swanley Giant, C. H. Curtis, &c; the second award going to Mr. John Calcutt, florist, High Street, whose giants were Viviand Morel, Phœbus, Mrs. C. H. Payne, Modesto, &c.; the choicest collection in the amateurs' section coming from Mr. W T. Felton (hon. sec.), whose finest forms were Madame Carnot, Phœbus, C. Davis, Edith Tabor, . Morel, Mrs. Trafford, President Borel, John Shrimpton, Boule d Or, W. Holmes, and Louis Bœhmer. Specimen plants were numerous and good, carrying four or five blooms each. Mr. C. W. Miles, gardener to C. W. Early, Esq., first, Mr. Blake second for examples of C. H. Curtis in the incurved class, the same variety winning in the amateur division; while for Japanese Mr. Felton was to the fore with Charles Davis. For four plants the awards went to Messrs. Blake and Miles for healthy specimens, the former having a grand Baron Hirsch, and the latter a nice bush of Brookleigh Gem.

Cut blooms were a strong feature, all fresh and of good size and colour, the premier award for a dozen Japanese going to Mr. Macfarlane, gardener to Harvey du Cros, Esq., Cornbury Park, who put up noble specimens of Stanstead White, Eva Knowles, W. Seward, Phœbus, Viviand Morel, and Gloire du Rocher; Mr. Blake second, very fine being Swanley Giant, Mdlle. Thérèse Rey, Mrs. Hume Long, Madame F Rosetti, Mons. Chenon de Leche, Madame Carnot, Souvenir de Petite Ami, Mrs. C. H Payne, C. Davis, Silver King, and Viviand Morel. The corresponding class for incurved was filled with excellent forms, the first prize going to J. L. Burgess, Esq., Maisey Hampton, Fairford, who put up big, well-finished examples of Duchess of Fife, Globe d'Or, Lord Wolseley, Charles Curtis, Prince Alfred, Perle Dauphinoise, Jeanne d'Arc, Robert Petfield, Mr. R. C. Kingston, and D. B. Crane; Mr. C. W. Miles, second For six of one variety Messrs. Macfarlane and Blake shared the honours with fine developments of Globe d'Or, the first-named winning with very large blooms; while for one bloom Mr. Macfarlane led with the same variety, Mr. Blake staging Charles Curtis, and Mr. Burgess Duchess of Fife. For six Japanese Mr. Macfarlane was once again to the fore with a lovely set of Phœbus (equal to anything yet seen in the district); Mr. G. Jacob, Exotic Nurseries, second, with Australian Gold; Mr. Miles, third, with Charles Davis. Some very fine flowers were exhibited by the amateurs, notably a grand specimen of Phœbus, by Mr. W. Whitcher, hairdresser (who also led for six of the same variety), a Viviand Morel by Mr. Felton, and a pretty form of Good Gracious by a cottager. Mr Calcutt secured the award for a basket of flowers and foliage, Mr. G Jacob being greatly praised for his lovely epergne of orchids, chrysanthemums, bouvardias, pancratiums, double primulas, statice, &c.; Mr. F. Walter second with a showy but somewhat more dwarf arrangement. Primulas were in evidence, and a good average, Mr. Jacob leading for double, and Mr. C. Brock, gardener to Dr. Batt, The Hill, for single forms.

A large proportion of the fruit on view was of excellent quality, Mr. C. Brock being first in each class for grapes, staging finely-finished clusters of Foster's Seedling and Alicante; Mr. C. Taylor, gardener to Captain Cottrell Dormer, Cokethorpe Park, second for Trebbiano and Alicante; Mr. Jacob third for black, with some perfectly-ripened Gros Colmar. Some apples from the chalky sediment at Wantage were remarkable for colour, the first prizes for six dishes and one dish going to C. O. Walter, Esq., Ickleton House, Berks, who put up Peasgood's Nonsuch (the finest fruit scaling twenty one ounces), Blenheim, Ribston, and Cox's Orange Pippins, Wellington, and Lane's Prince Albert. Some grand Pitmaston Duchess pears gained chief honours for Mr. Clack; and a collection of eighteen varieties of remarkably fine apples came from Mr. J. Anderson, gardener to James Mason, Esq., Eynsham Hall, specially large and high-coloured being Mère de Ménage, King of the Pippins, Yorkshire Greening, and Hanwell Souring; his Alicante and Muscat grapes were also noteworthy. This same exhibitor also arranged a very extensive grouping of Japanese, pompon, and single chrysanthemums set in ferns, palms, and grevilleas, &c., which entirely filled the platform at the end of the hall. In the ante-rooms were several very excellent collections of a dozen varieties of vegetables, Mr. John Baker, Bampton, first, having extra good cauliflowers, tomatos, carrots, and kidney beans, the latter large, straight, and of excellent colour. The carrots, parsnips, &c., were equal to those of an ordinary season, the onions and potatos being shapely though large.

BROMLEY CHRYSANTHEMUM SOCIETY, November 9 and 10

THIS flourishing society held its seventeenth annual exhibition on the above dates in the Grand Hall, Bromley, and the exhibits staged fully maintained the high reputation this society has for the excellence of culture displayed at its annual shows.

CUT BLOOMS.—As usual these were the feature of the show. In the big class, in which a ten guinea cup is offered, the competitors have to stage twenty-four Japanese distinct and twenty-four incurved, not less than eighteen varieties. The magnificent stand of blooms staged by Mr. C. Payne, gardener to C. J. Whittington, Esq., Elmhurst, Bickley Park, secured him the premier award. His Japanese were splendid blooms of Simplicity, G. C. Schwabe, E. Teichmann, Australie, C. Payne, Matthew Hodgson, Mrs. J. Lewis, Mrs. W. H. Lees, Viviand Morel, Dorothy Seward, Julia Scaramanga, Joseph Chamberlain, Edith

Tabor, Pride of Exmouth, Mrs. M. Grant, Mdlle Thérèse Rey, Mrs. G Carpenter, Mrs. H. Weeks, Edwin Molyneux, Phœbus, Beauty of Adelaide, and Chas. Davis. Amongst the incurved he staged were fine, clear examples of Globe d'Or, Ma Perfection, Mrs. J Murray, Duchess of Fife, Prince Alfred, Triomphe d'Eve, Mr. C Eagon, Madame Ferlat, Violet Tomlin, Charles H. Curtis, Mons. Desblanc, Mrs. R. C. Kingston, Austin Cannell, Mrs. Molyneux, George Haigh, and R. Petfield. Mr. J. E. Poole, gardener to W. A. G. Hubbuck, Esq., Elmstead Lodge, Chislehurst, was second. Most noticeable amongst his Japanese were Mons. Chenon de Leche, Mrs. H. Weeks, Lady Ridgeway, and Mrs. G. W. Palmer, whilst of his incurved perhaps the pick were Mrs. R. C. Kingston, Mrs. N. Molyneux, and Mrs. J. Murray. The third prize went to Mr. J. Lyne, gardener to F. Tiarks, Esq., Chislehurst; and the fourth to Mr. P. Wheadon, gardener to W. J. Langton, Esq., the Red House, Bickley. For twelve incurved and twelve Japanese, distinct, Mr. H. Redder, gardener to W. G. Bird, Esq., Manor House, West Wickham, was first. The incurved he staged were fine blooms of C. H. Curtis, Mr. J. Kearns, Jeanne d'Arc, Baron Hirsch, Mrs. R. C. Kingston, Mrs. S. Coleman, Mrs. J. Murray, Madame Darrier, Prince Alfred, Miss Violet Tomlin, Duchess of Fife, and Princess of Wales. His Japanese were splendid examples of Edith Tabor, Madame N. Ricoud, Mrs. H. Weeks, Mdlle. Thérèse Rey, Mrs. F. Jameson, Edwin Molyneux, Charles Davis, Préfet Roberts, Louise, Phœbus, Viviand Morel, and Simplicity. Mr. Payne secured the other award. Mr. J. Blackburn, gardener to W. J. Scott, jun., Esq., J.P., Elmhurst Grange, Chislehurst, was the first of the four exhibitors in the class for twenty-four Japanese distinct, staging fine blooms of Mr. G. Warren, Eva Knowles, Edith Tabor, Beauty of Teignmouth, Phœbus, Royal Standard, Mutual Friend, Charles Davis, Mons. Chenon de Leche, General Roberts, C. F. Payne, Australian Gold, Mrs. H. Weeks, Viviand Morel, Golden Gate, Ella Curtis, Mustapha, G. C. Schwabe, J. Bidencope, Matthew Hodgson, Lady Hanham, Simplicity, Oceana, and Dorothy Seward.

Mr. Poole, gardener to W. A. G. Hubbuck, Esq., was first for six Japanese, six reflexed, and six incurved, distinct. His Japanese were Viviand Morel, J. Bidencope, Phœbus, Mons. Chenon de Leche, Graphic, and Oceana; the incurved were C. H Curtis, Duchess of Fife, Ernest Cannell, Topaze Orientale, President Nonin, and Ma Perfection; and the reflexed were Charles Tutt, Miss F. Lawson, Dorothy Oxberry, Mdlle. Tityens, Aurore, and Dorothy Gibson. Mr. Lyne was second, and Mr. W. Thomas, gardener to J. Greig, Esq., Shepherds' Green, Chislehurst, third. There were four entries in the class for twelve incurved, distinct, and of these Mr. J. Munro, gardener to J. Lloyd Bucknall, Esq., Langley Court, Beckenham, secured the premier award. His stand contained fine examples of Mrs. R. C. Kingston, Ma Perfection, Violet Tomlin, Lord Alcester, Baron Hirsch, Mrs. J. Kearns, C. H. Curtis, Queen of England, Madame Darrier, J. Agate, Lord Wolseley, and John Salter. The second prize went to Mr. Redder, and the third to Mr. W. Pascoe, gardener to Captain Torrens, Beston Manor, Hayes. For six incurved, distinct, Mr. C. Payne was the successful exhibitor, with good examples of Duchess of Fife, C. H. Curtis, Globe d'Or, Mrs J. Murray, Madame Ferlat, and Robert Petfield; Mr. G. Prebble, gardener to M Hodgson, Esq., Shirley Cottage, Croydon, was second; and Mr. F. Francis, gardener to C. S. Good, Esq., Oak House, Green Street Green, Orpington, third. For twelve Japanese, distinct, Mr. Budworth was the first of the six exhibitors, staging splendid blooms of Chas. Davis, Emily Selsby, W. Seward, Phœbus, Robert Powell, Madame Gustave Henry, Viviand Morel, Mutual Friend, Mons. Chenon de Leche, Eva Knowles, G. J. Warren, and N. C. S. Jubilee. Mr. C. Blick, gardener to Martin Smith, Esq., The Warren, Hayes, and Mr. Travers secured the other awards. There were no less than eight entries in the class for six Japanese distinct, and of these the premier award went to Mr. Blick for some splendid blooms of G. J. Warren, Mutual Friend, Viviand Morel, Madame Carnot, Eva Knowles, and Edith Tabor; Mr. Blackburn was second and Mr. E. Stone, gardener to C. D. Clark, Esq., Eccles Hill, Hayes Lane, Bromley, third. Mr. Dodd was first for six anemones, with nice specimens of Mrs. H. Gardener, Judge Benedict, Madame Chate, John Bunyan, Descartes, and Sabine. The other awards went to Mr. Stone and Mr. Pascoe. Mr. Dodd was also first for twelve pompons, distinct, his blooms being Black Douglas, Pygmalion, Maid of Kent, White Mdme. Martha, Golden Mdme. Martha, Prince of Orange, Elsie Wallis, Erasus, Eynsford Gem, President, Our Fred, and William Sabey; Mr. Pascoe was second. For twelve singles Mr. E. Marshall, gardener to W. Hardy, Esq., South Bank, Chislehurst, secured the award with fine blooms of Mayblossom, D. Winsor, Miss Cressy, Charming, Rev. W. E. Renfrey, Emily Webb, Oceana, Gertie Sedgley, Pattie Ranford, and David Winsor. Mr. Lyne was first for six incurved of one variety with blooms of Duchess of Fife; Mr. Redder was second with C. H. Curtis, and Mr. Payne third with Duchess of Fife.

For six Japanese of one variety Mr. Blick was first with magnificent blooms of Edith Tabor. For six blooms of C. H. Curtis there were no less than eleven entries, the awards going in favour of Mr. Redder, Mr. Dodd, and Mr. Blackburn in the order named. Mr. J. E. Poole was first for six Japanese, distinct, with blooms of C. F. Payne, J. Bidencope, Chatsworth, Mons. Chenon de Leche, Lady Hanham, and Mr. Grant; Mr. J. Amey, gardener to F. E. Leibrich, Esq., Loys Hill, Chislehurst, was second, and Mr. E. Marshall, gardener to W. Hardy, Esq., South Bank, Chislehurst, third. Mr. Poole was also first for six incurved, distinct, with fine blooms of C. H. Curtis, Yvonne Desblanc, Madame Darrier, Mr. J. Eadie, Duchess of Fife, and Golden Empress; the other awards went to Mr. Amey and Mr. Marshall. There were three classes for single-handed gardeners—for twelve Japanese, for six Japanese, and for six incurved. In the first Mr. J. H. Simpson, gardener to R. Field, Esq., Oak Lawn, Beckenham, secured the premier award, staging nice blooms of Chas. Davis, Mutual Friend, G. C. Schwabe, Madame Carnot, Phœbus, Graphic, Edith Tabor, Viviand Morel, Colonel W. B. Smith, G. J. Warren, Elsie Teichmann, and Mons. Chenon de Leche; Mr. E. Legg, gardener to G. W. Devon-Astle, Esq., The Cedars, Bickley, was second, and Mr. J. Knapp, gardener to F. W. Amsden, Esq., Chichester Road, Croydon, third. Mr. Knapp was, however, first for six incurved distinct, in which class there were five entries. The blooms he staged were Baron Hirsch, C. H. Curtis, Globe d'Or, Jeanne d'Arc, Madame Darrier, and Prince Alfred. Mr. C. Croker, gardener to W. Rogers, Esq., Hawthorn Road, Bickley, and Mr. Simpson were second and third respectively. There were six entries in the class for six Japanese distinct, and of these the prize-winners were Mr. Legg, Mr. Knapp, and Mr Croker in the order named. On Mr. Legg's stand were good specimens of Simplicity, International, Thomas Wilkins, Australie, G. C. Schwabe, and Miss Elsie Teichmann. The amateurs' classes were chiefly noticeable by reason of the magnificent stand of twelve Japanese, staged by Mr. William Weekes, Bromley, which secured him the premier award in that class. His blooms were wonderfully fine examples of Madame Carnot, G. J. Warren, Mrs. Weeks, Edith Tabor, Pride of Madford, Charles Davis, G. C. Schwabe, Simplicity, J. Bidencope, Mutual Friend, Viviand Morel, and Elsie Teichmann. Of the other seven competitors in this class the two best were adjudged to be Mr. T. Griffin, Weybridge, and Mr. James Cartwright, Lewisham.

There were only two entries in the class for a group of chrysanthemums not to exceed fifty square feet, Mr. Brister securing the premier award with a beautifully arranged group, in which were noticeable some very fine blooms; Mr. Dove was second. For a single trained specimen Mr. Brister was again first, the other prize going to Mr. W. Hopgood, gardener to P. C. Parr, Esq., Powis Lodge, Bickley. Mr. Blick, Mr. Lyne, and Mr. Pascoe were the successful exhibitors in the class for twelve table plants, whilst for six table plants Mr. Munro, Mr. Amey, and Mr. Blackman were the prize-winners. For twelve Chinese primulas the awards were in favour of Mr. Brister, Mr. Legg, and Mr. Amey, and for six Chinese primulas Mr. C. Cooke, gardener to W. Rogers, Esq., Hawthorn Road, Bickley, was first, Mr. Hopgood second, and Mr. C. Heath, gardener to J. C. Holmes, Esq., The Corner House, Shortlands, third. In the class for twelve zonal pelargoniums there were five entries, the first prize winner being Mr. M. Paice, gardener to H. M. Pollett, Esq., Fernside, Bickley, who staged some magnificent trusses, the most noticeable of which were J. M. Barrie, Chas. Mason, and Trilby; Mr. G. Wheadon, gardener to J. Layton, Esq., The Red House, Bickley, was second, and Mr. Pascoe third.

FRUIT AND VEGETABLES were fairly numerous and of good quality. Mr. Amey, Mr. Blackburn, and Mr. Lyne were first, second, and third for black grapes, whilst for white grapes Mr. Blackburn and Mr. Blick were successful. Mr. C. Jordan, gardener to H. Hoskier, Esq., Coney Hill, Hayes Common, secured the premier award for a collection of fruit, Mr. Blackburn being second, and Mr. Blick third. In the class for dessert apples there were eight entries, Mr. W. A. Searing, Parkwood, Swanley, securing the premier award, the other prizes going to Mr. H. Filkins, gardener to R. B. Berens, Esq., Kevington, St. Mary Cray, and Mr. Lyne. Mr. Lyne was, however, first for cooking apples, with Mr. Dove and Mr. Searing second and third. For pears the awards were in favour of Mr. Blick, Mr. Jordan, and Mr. Simpson. Mr. Blick was also successful for a collection of vegetables, with Mr. Filkins second, and Mr. Dove third.

The platform in the main hall was extremely tastefully decorated with plants and flowers by Messrs. J. Laing and Sons, Forest Hill.

LIVERPOOL HORTICULTURAL ASSOCIATION, Nov. 9 and 10.

THE nineteenth autumn show was held under the auspices of the above society in St. George's Hall, under most favourable climatic conditions. The exhibition in many details showed a distinct improvement, and for merit alone must be conceded the finest held by the association. The number of entries were three hundred and eighty-one, an increase upon last year of forty-two; this extra influx gave the Staging Committee a considerable amount of difficulty in finding room for the exhibits.

The plants of chrysanthemums called for no special comment; the groups contained many fine flowers, and the premier lots of pompons were remarkably pretty, carrying medium-sized flowers. Four trained, two Japanese, and two incurved varieties, J. G. Hitchin, Esq. (gardener, Mr. J. Rose), won with Colonel Smith, Viviand Morel, Mrs. G. Rundle, and Mrs. Dixon; J. A. Bartlett, Esq. (gardener, Mr. T. Gowen), and Mr. J. Harrison being the remaining prize-winners. For the single specimen H. Cunningham, Esq. (gardener, Mr. W. Wilson), Mr. John Rose, and Mr. J. Harrison were placed as named. For three pompons, Mr. W. Wilson won with models of W. Kennedy, Wm. Westlake, and Emily Rowbottom; Messrs. J. Harrison and J Rose being second and third. For the singles Mr. W. Wilson again scored, with Emily Rowbottom. For one standard, Mr. Thos. Gowen scored with Mrs. Dixon; for one pyramid, Mr. W. Wilson had the best. For six untrained and a single specimen Mr. T. Gowen took the lead, with well-flowered plants.

For groups of chrysanthemums, sixty square feet, E. Pryor, Esq. (gardener, Mr. E. Taylor), won with flowers of considerable merit, Messrs. J. Harrison and W. Bustard following. For twelve Japanese in five-inch pots, John Findlay, Esq. (gardener, Mr. E. Wharton), Messrs. Thomas Gowen and G. Haigh were placed as named.

CUT BLOOMS.—These certainly were a distinct advance upon anything previously seen, the new varieties standing out with special prominence, especially in depth. For twenty-four incurved and twenty-four Japanese, distinct, for the Society Silver Challenge Vase and £10—First, R. P. Houston, Esq. (gardener, Mr. J. Heaton), his Japanese being Madame G. Henry, Mons. H. J. Jones, Graphic, Ella Curtis, Mons. Hoste, Eva Knowles, Simplicity, Australian Gold, Phœbus, Mons. C. de Leche, Pride of Madford, Duke of Wellington, Edwin Molyneux, Pride of Exmouth, Mrs. G. W. Palmer, N.C S. Jubilee, Australie, Mrs. J. Lewis, Edith Tabor, Lady Hanham, Robert Powell, Lord Justice Lopes, Mons. Panckoucke, and Lady Ridgeway. Incurved—Duke of Fife, Perle Dauphinoise, Miss D. Foster, Ma Perfection, C. H. Curtis, James Agate, Lord Alcester, Leonard Payne, Queen of England, John Doughty, Violet Foster, Mrs. N. Molyneux, Empress of India, John Salter, Robert Petfield, Miss M. A. Haggas, Austin Cannell, Golden Empress, Baron Hirsch, Miss V. Tomlin, Globe d'Or, and Princess of Wales. G. B. Cockburn, Esq. (gardener, Mr. G. Burden, Birkenhead), second, with a fine stand of Japanese and immense incurved flowers of Lady Isabel, Madame Ferlat, John Lambert, &c. Thomas Gee, Esq. (gardener, Mr. P. Green, Allerton), third; Miss Thompson (gardener, Mr. R. Foster, Broad Green), fourth.

For eighteen incurved distinct, E. Ellis, Esq. (gardener, Mr. J. Davies Heswell) was first with smart flowers, Lady Isabel, C. H. Curtis, John Lambert, and Madame Ferlat being the best. Mr. C. Osborne, second; and Mr J. Jakeman, third. For twelve incurved varieties, distinct, Lord Trevor (gardener, Mr. W. Davies, Chick) won with a good stand. For six incurved, distinct, E. Edmundson, Esq. (gardener, Mr. C. Sherlock), staged the best; for eighteen Japanese H. Tate, Esq. (gardener, Mr. C. Osborne), won with good flowers, Lady Ridgeway, Duke of Wellington, Madame Gustave Henri being the most noteworthy, C. Ellis, Esq. (gardener, Mr. J. Davies), and Mr. P. Jakeman taking the remaining prizes. For twelve Japanese, distinct, Mr. W. Davies won with fine flowers, the front row being exceptionally good. For six Japanese, distinct, F. W. Mayor, Esq. (gardener, Mr. J. George), took the lead; for six anemones, distinct, and six reflexed, distinct, Mr. W. Wilson won in both classes.

For twelve pompons, not less than six varieties to be shown in bunches of three flowers, J. Findlay, Esq. (gardener, Mr. E. Wharton), won with magnificent flowers charmingly staged. In the class for those who have never won a prize of the society, Mr. A. H. Randall took leading honours. Messrs. E. Blair and T. Sumner took the leading prizes in amateurs' classes. A basket of chrysanthemums, arranged with fern, brought twelve competitors, C. J. Procter, Esq. (gardener, Mr. J. Williams), winning with a beautiful combination.

For a circular group of plants, eighty square feet, a strong fight was made, this entry causing a distinct charm to the whole show. W. H. Watts, Esq.

(gardener, Mr. J. Bracegirdle), was adjudged the premier award for large flowers intermixed with ferns, palms, &c. T. S. Timmis, Esq. (gardener, Mr. B. Cromwell), had a beautiful combination in which crotons, palms, and alocasias gave a pretty effect. For a basket of plants, prizes given by Messrs. R. P. Ker and Sons, the first prize was won by Mr. E. Pryor, Cattleya labiata and other orchids being shown to advantage. For four ferns distinct, Mr. J. Bracegirdle won with grand specimens of Glechenia Mendelli, Nephrolepis davallioides furcans (eight feet diameter), Goniophlebium subauriculatum, and Microlepia hirta; Messrs. B. Cromwell and T. Gowen second and third respectively. For three orchids, distinct, Mr. J. Bracegirdle won with Cattleya Bowringiana, Cypripedium Spiceranum, and Cattleya labiata. For two orchids suitable for cool house prizes were given by Messrs. John Cowan and Co., Gateacre. F. Cross, Esq. (gardener, Mr. E. Duke), won with Oncidium crispum and O. varicosum Rogersi. For a single orchid Mr. J. Bracegirdle was again successful with a fine Cattleya labiata Emperor. This exhibitor was again to the fore for one cypripedium, winning with a well-flowered C. insigne.

FRUIT constituted the finest feature of the show, over one hundred bunches of grapes being entered, whilst the apples, both for size and colour, were splendid. In the class for six dishes of fruit, distinct (pines excluded), Mrs. Bright (gardener, Mr. J. Skitt, West Derby) won with Gros Colmar and Muscat of Alexandria grapes (good), Louise Bonne and Marie Louise pears, Worcester Pearmain and Ribston Pippin apples; second, Messrs. W. and E. Gladstone (gardener, Mr. T. Elsworthy); third, Earl of Derby (gardener, Mr. R. Doe, Knowsley). For four bunches of grapes, two black and two white, Mr. T. Elsworthy staged the best in Muscat of Alexandria and Black Alicante. The same exhibitor won for two bunches of Black Alicante. For any other black, C. Gatehouse, Esq. (gardener, Mr. H. May), won with large bunches of Barbarossa. For two bunches of white Muscats, Mr. W. Neild, Holmes Chapel Horticultural School, was well to the fore with fine berries, superbly coloured. For any other white Mr. J. Skitt was to the fore with good Golden Queen. For six dishes dessert pears, distinct, Mr. R. Hanagan, Cheshire, won with Pitmaston Duchess, Marie Louise, Doyenne du Comice, and others; Mr. W. Bustard and Mr. J. McColl taking the remaining prizes. For four dishes, distinct, Messrs. R. Hanagan, R. Doe, and H. Reynolds were placed as named. For a single dish Mr. H. Reynolds won with Doyenne du Comice out of nineteen competitors. For six dishes dessert apples, distinct, W. E. King King, Esq. (gardener, Mr. J. Davis), Leominster, won with well-coloured samples of Colonel Vaughan, Cox's Orange and Ribston Pippins, Worcester Pearmain, Blenheim Orange, and King of the Pippins; J. Lee, Esq., Cheshire, and W. Morgan, Esq, Herefordshire, were second and third respectively. For three dishes, distinct, Earl of Derby, Mrs. R. Pinnington, and Mr. J. Lee were the winners. For the single dish Mr. T. Ferguson was adjudged the best of 27 entries. For eight dishes culinary varieties Mr. J. Davies won with grand fruit, Mère de Ménage and Peasgood's Nonsuch being most conspicuous; Mr. Morgan second. For four dishes culinary varieties, distinct, Mr. J. Lee took the lead. The prize for a single dish was won by Mr. J. Davis, with Peasgood's Nonsuch.

Certificates of merit were awarded to Messrs. J. Cowan and Co., for a fine group of orchids in variety with foliage plants; Messrs. R. P. Ker and Sons, for a fine bank of cyclamen; to Turner Bros., for a pleasing display of floral designs; and to Dicksons (Limited), Chester, for apples and ornamental plants.

ROYAL HORTICULTURAL SOCIETY OF IRELAND.

THE chrysanthemum show in connection with this society was held on Wednesday and Thursday, November 9 and 10, in the rooms of the Royal Dublin Society. It showed a very marked improvement on its predecessors. The groups of plants were a decided advance on any we have previously seen there, the hall was better filled than usual, and the non-competitive exhibits around the sides gave a decided finish to the exhibition. The weather, too, was splendid, and in consequence the attendance was far above the average. The judging of cut blooms and plants was splendidly done, but there appeared to be some errors of judgment with regard to fruit and vegetables; for example, two very moderate bunches of Trebbiano grapes were awarded first prize, while two superb bunches of Muscat of Alexandria only secured second place. In the cut bloom classes the first prize stand in nearly every case was far ahead of the others, but the competition was very close for the remaining awards. Mr. McKellar, gardener to Lord Ashbrooke, Castle Durrow, Queen's County, secured first place in every class in which he exhibited with superb blooms, verifying the prediction we made here a few years ago that the then champion would have to look out, for this young exhibitor was forging ahead. He is to be congratulated on having attained the object of his ambition.

For forty-eight blooms in as many distinct varieties the first prize of £10 and the society's large silver medal were well won by Mr. H. Crawford, gardener to Gertrude, Countess of Pembroke, Mount Merrieu, Booterstown, county Dublin; Mr. Mitchison, gardener to Hon. C. F. Crichton, Mullaboden, Ballymere Eustace, co. Kildare, second; Mr. McKenna, gardener to Lady Bury, Charleville, Tullamore, King's County, third. For a stand of thirty-six blooms, eighteen Japanese and eighteen incurved, in not less than twenty-four varieties, nor more than two of any variety, the first prize was a challenge cup valued ten guineas, offered by Messrs. Waterhouse and Co., Dame Street, Dublin, with a cash prize of £3 added by the society; this was ably won by Mr. McKellar, gardener to Lord Ashbrooke, Durrow Castle, Queen's County; Mr. H. Crawford, second; Mr. Fernie, gardener to R. de la Poer, Esq., Kilcronagh, Waterford, third. The principal prize from a gardener's point of view is the "Gardeners' Prize," which is a "challenge cup," value ten guineas, presented by the gardeners of Ireland, with £3 added by the society to the first prize. Mr. McKellar secured this coveted trophy with superb blooms; Mr. Mitchison, second; Mr. McKenna, third. In the class for twenty-four incurved blooms, in eighteen varieties, the first prize, a piece of plate presented by the Ichthemic Guano Company, with money prizes added by the society, was won by Mr. McKellar, with Mr. Crawford second. For twelve incurved, in six varieties, Mr. Farrell, gardener to Clifford Lloyd, Esq, was well first, Mr. McKenna second, Mr. Rigg, gardener to Lord Cloncurry, Lyons, Hazelhatch, co. Kildare, third. Mr. H. J. Jones, Ryecroft Nurseries, Lewisham, presented a silver-gilt medal, and this with money prizes added by the society for twelve Japanese, in six varieties, was won by Mr. Maher, gardener to C. S. Spear, Esq.; Mr. Webster, gardener to Lord Plunkett, Old Connaught, Bray, co. Wicklow, second; and Mr. Dunne, gardener to J. C. Parkes, Esq., third. For twelve blooms, six Japanese and six incurved, distinct, open only to exhibitors who had never previously won a first prize at any of the society's chrysanthemum shows, Mr. Webster came first, and Mr. Rigg second.

For anemone-flowered chrysanthemums, twelve blooms, in at least six varieties, Mr. McKenna came first; Mr. Morrison, gardener to J. Gubbins, Esq., Bruree, co. Limerick, second; and Mr. McLennan, gardener to Lord Carew, Castle Boro', Enniscorthy, co. Wexford, third. For pompons, twelve bunches, in six varieties, Mr. Rigg first, R. T. Harris, Esq., second, and Mr. Mitchison third. For a stand of six white Japanese, in one variety, the prizes were presented by Messrs. Alex. Cross and Sons, Glasgow, and here Mr. McKellar was again a good first; Mr. McKenna second. For six yellow Japanese Mr. McKellar was again first with wonderful blooms of Australian Gold; Mr. Kearns, gardener to Mrs. Moore, second; Mr. Farrell, gardener to Clifford Lloyd, Esq., third. For six incurved blooms, any variety, Mr. McKellar was first, Mr. Crawford second. There was a spirited competition in the class for the three vases of chrysanthemums in three varieties, three blooms of each, own foliage only allowed, and blooms to be not less than twelve inches above the vase; Mr. McKellar was first, Mr. Mitchison second, and Mr. Maher third. For a basket of chrysanthemums, any foliage allowed, F. V. Westby, Esq., came first, Miss Carty second, and Miss Taafe third.

For a group of plants, not to exceed thirty pots, Mr. Goff, gardener to Mrs. McCann, scored, and Mr. McKenzie, gardener to Mrs. Pease, second. The same competitors, and in the order named, secured the prizes for thirty-six specimens arranged in a group of fifty superficial feet, staging in an effective manner well-grown plants. The best group of twelve plants came from Mr. Coghlan, gardener to Mrs. W. McComas; Mr. Goff, gardener to Mrs. McCann, second; and Mr. Geoghegan, gardener to J. Miller, Esq., third. For six pompons Mr. Goff, Mr. Geoghegan, and Mr. Dunne were the prize-winners. For four plants, any varieties, of chrysanthemums for decoration, to be grown in pots not exceeding eight inches in diameter, Mr. Goff was first, and Mr. Finnegan, gardener to H. B. White, Esq, second. For a specimen chrysanthemum Mr. Goff and Mr. Kirk, gardener to Colonel Clements, secured the awards, while for six pots of primulas Mr. Goff was again first; Mr. Anderson, gardener to R. Tedcastle, Marley, Rathgarnham, second; and Mr. McKenzie, third. Mr. Campbell, gardener to Lord Ardilaun, was first with six magnificent Primula obconica; Mr. McKenzie second, and Mr. Kearns third. For six table plants, distinct, in six-inch pots, Mr. McLennan was first, Mr. Rigg second, and Mr. Sayers, gardener to Mrs. Goodbody, Obelisk, Blackrock, co. Dublin, third. Mr. McKellar secured the prizes for the premier chrysanthemum bloom in the show, having a superb bloom of Australian Gold as Japanese and C. H. Curtis incurved.

There was an imposing display of fruit of all kinds, excellent grapes being shown. For four bunches in two varieties Mr. McKenna was first and Mr. Bunting, gardener to F. V. Westby, Esq., second. For two bunches white grapes Mr. Mernagh, gardener to Mrs. Bookey, came first, Mr. McKenna second. For two bunches black grapes Mr. T. Caldwell, gardener to R. Tedcastle, Esq., was first and Mr. Bunting second. For a dish of six baking pears Messrs. Goff, Sheppard, and Weeks were first, second, and third respectively. The best dessert pears came from Messrs. Morrison, Carr, and Harvey. Mr. Harvey showed the best baking apples, and Mr. Colgan the best Warner's King. For a dish of six dessert apples Messrs. McKenzie, Pilgrin, and Tobin came first, second, and third respectively, while for Ribston Pippins Messrs. McKenna, Stringer, and Campbell won in the order named. For six fruits of Cox's Orange Pippin Messrs. McKenna, Morrison, and McKenzie took the awards. The best collection of twelve dishes dessert pears in as many varieties, four fruits each, came from Mr. McKenna, Mr. Whitelaw, gardener to the Earl of Drogheda, Moore Abbey, Monasterevan, co. Kildare, second, and Mr. Tobin, gardener to J. F. Lombard, Esq., third. Mr. McKenna was first for twelve varieties of apples in dishes of six, and for six varieties of dessert apples.

Vegetables were exceedingly well shown, onions probably being the best ever exhibited in Dublin, Mr. Hartley coming first, Mr. McKellar second, Mr. Webster third. For white celery Mr. Stringer was first and Mr. Byrne second. For red celery Mr. Byrne and Mr. McLennan took the prizes. The best collection of twelve distinct kinds of vegetables was staged by Mr. Stringer, Mr. McLennan second, Mr. Reynolds third. For a collection of six distinct kinds of vegetables Mr. Hartley and Mr. Russell came first and second. Miss L. Taaffe, Mrs. Geoghan, and Miss M. G. Ball secured the prizes for dinner table decorations. Mr. R. Jameson secured the silver medal offered to nurserymen by the society for the best group of foliage and flowering plants, Messrs. Ramsay securing the bronze medal.

Messrs. Alex. Dickson and Sons secured the society's silver medal for a magnificent collection of over two hundred dishes of fruit superbly staged and splendidly coloured, and the bulk of these were put up in huge basketfuls, creating a splendid display. Messrs. Saunders and Son, Cork, secured a similar award for a collection of two hundred varieties of fruit, while Messrs. Richard Hartland and Sons, Cork, were awarded the society's bronze medal for a fine exhibit.

WARE HORTICULTURAL SOCIETY, November 9 and 10.

OF exceptional excellence was the annual exhibition of this society, which was held in the Town Hall, Ware, on the above dates. The principal hall and side rooms were literally packed with products, that with but few exceptions were staged in competition, and the quality was throughout so high that it has not been surpassed on any previous occasion.

The classes for cut blooms were well filled, and having regard to the season the principal stands were remarkable for the high finish of the blooms. Mr. G. Fulford, gardener to R. Walters, Esq., The Priory, Ware, again distinguished himself in taking the premier award (this year a valuable silver cup) for thirty-six blooms to comprise equal numbers of incurved and Japanese. The collection was remarkable for its uniformly high qualities, and the varieties included Viviand Morel, selected as the premier Japanese in the exhibition, Lady Byron, Mrs. G. W. Palmer, Mrs. H. Weeks, Mons. Chenon de Leche, Australie, Charles Davis, Lady Hanham, and G. J. Warren, of the Japanese; and Ma Perfection, Queen of England, Mrs. R. C. Kingston, Madame Ferlat, Madame Darrier, Violet Foster, C. H. Curtis, Globe d'Or, and Lord Alcester, incurved. Mr. G. Fulford, gardener to A. G. Sandeman, Esq., Presdales, Ware, was second, with fine blooms. For twelve Japanese blooms the last-named exhibitor occupied the post of honour with good blooms of well-known varieties, closely followed by Mr. G. Fulford, The Priory, and Mr. R. Dover, gardener to R. Barclay, Esq., High Leigh, Hoddesdon. In the corresponding class for incurved varieties Mr. C. Bank, gardener to S. Croft, Esq., St. Margaret's, Ware, was first with a fine stand containing a superb bloom of Duchess of Fife, adjudged the premier incurved in the exhibition. Mr. G. Fulford, The Priory, was an uncomfortably close second, and Mr. R. Dover a good third. Mr. A. J. Willsher, gardener to the Rev. M. Kirkby, The Vicarage, Ware, was first for six Japanese, distinct. Mr. Dover obtained premier honours for six Japanese blooms, one variety, with Australian Gold, and Mr. F. Gull, Amwell, was second with Madame Carnot. For three Japanese, one variety, Mr. Durrant, Ware, was first with Lady Hanham, and Mr. D. Garratt, Hertford, followed for second place with Viviand Morel. Mr. Dover was first for six reflexed, which was not a very strong class.

The most important of the plant classes were those arranged for effect, and in the class for large groups of chrysanthemums Mr. C. Bank and Mr. G. Fulford, The Priory, were first and second respectively, with arrangements remarkable for the high quality of the blooms and the taste displayed in grouping. Highly satisfactory were the smaller groups of chrysanthemums, for which Mr. D. Garratt, Mr. J. H. Spencer, and Mr. A. J. Willsher were first, second, and third respectively. Of exceptional excellence were the collections of miscellaneous plants arranged for effect, and much praise is due to Mr. G. Fulford, Presdales, Mr. R. Dover, and Mr. C. Bank. The last-named exhibitor had the best six table plants, and Mr. F. H. Gull was first for cyclamen, zonal pelargoniums, primulas, and winter-flowering begonias; Mr. Dover and Mr. C. Seden also exhibited successfully in these classes.

Fruit and vegetables were highly meritorious, and Mr. A. J. Willsher, in the apple and pear classes, added to his successes at Hertford in the previous week, taking four first prizes, three of which were for collections. Mr. F. H. Gull was first for black grapes with huge, superbly-finished clusters of Alicante. Mr. C. Bank and the Messrs. Fulford, with other exhibitors, competed successfully in the fruit classes. In the open class for collections of vegetables Mr. C. Bank, Mr. Willsher, and Mr. R. Dover were the prize-takers in the order of their names with produce evincing much cultural skill. There was a very strong competition in the cottagers classes, both as regards the number of entries and the quality of the produce.

The floral arrangements were of a mixed order, some being highly creditable, while others were decidedly poor. The most beautiful vase was that of chrysanthemums shown by Mr. Durrant.

COVENTRY, November 8 and 9.

THE members of the Chrysanthemum Society of the "City of Spires" may well be proud of the rapid advance made during the few years it has held an annual show. The Market Hall was utilised this year in place of the Corn Exchange, the latter building not being available. The energetic secretary, Mr. F. Curtis, and members of the committee are to be congratulated on the efficient way they arranged and draped this immense building in order to make it suitable for the exhibition. The classes set apart for groups of chrysanthemums were well represented, first honours being secured by Mr. Morris, gardener to Sir R. Moon; Mr. Blake, gardener to W. H. Herbert, Esq., second. Mr. Chandler, gardener to A. James, Esq., Rugby, easily secured both first prizes in the principal cut flower classes, viz., for twenty-four Japanese and twenty-four incurved; Mr. Blakeway, gardener to P. A. Mundy, Esq., being second in the former, and Mr. Collier, gardener to G. Singer, Esq., second in the latter class. Non-competitive exhibits were without doubt a special feature of the show, and came in for a large share of admiration. In the centre of the hall Mr. Finch, nurseryman, had erected a most imposing and artistically arranged display, containing towering palms, well-coloured crotons, dracænas, orchids, &c. This exhibitor also had a stand of beautiful wreaths and anchors. Mr. H. T. Martin, gardener to the Right Hon. Lord Leigh, had an excellent show of vegetables and fruit, occupying thirty feet of staging; the former contained twenty-two distinct kinds of vegetables in season, and all were well-grown and clean examples. Interspersed amongst the thirty dishes of fruit were many grand blooms of exhibition-sized chrysanthemums, the whole exhibit being backed up with palms and crotons. Messrs. Perkins, the well-known Court florists, had a magnificent shower bouquet, composed principally of orchids. Messrs. Kimberley and Sons, nurserymen, had an attractive group of plants, and Sir R. Moon a collection of fruit. Large-flowering violets in variety were well shown by Messrs. J. House and Son, Westbury-on-Trym, Bristol. The attendance on both days was good, and this comparatively young society bids fair to rank as one of the best in the county.

WINDSOR, November 10.

THE seventh annual exhibition was held as usual in the Albert Institute, and was much the best of the series. A great improvement was manifest in the general excellence of the exhibits. Especially is this remark applicable to the chrysanthemum groups both in the amateur and open classes. The arrangements were as usual of a perfect order in the hands of Mr. Finch, the hon. secretary, and an efficient committee, of which Dr. Wyborn is the able chief.

For a group of chrysanthemums in pots a challenge cup is offered in addition to the first prize, which no doubt stimulates the competition, as no less than six competed, making a pleasing display. Mr. W. Cole, gardener to Mrs. E. B. Foster, was an easy first with plants dwarf in growth, well clothed with foliage, and carrying good blooms, the arrangement leaving little to be desired; Mr. W. Davis, gardener to Henry Adams, Esq., second; Mr. A. Gillies, gardener to Sir Robert Harvey, third. In the amateurs' section for a similar group there was keen competition and a really meritorious display. Mr. H. Edwards, 32, Albert Street, Clewer, Windsor, secured the leading award with suitable well-grown plants; Mr. J. R. Stribling second with plants carrying good blooms, but not the best of arrangement. Dr. Wyborn secured the remaining award with capitally-grown plants tastefully arranged, but lacking quality in the flowers. Specimen plants were sparsely shown, Mr. Fifield, gardener to R. Cawte, Esq., winning the premier award for four with profusely-flowered examples of Mrs. G. Rundle, Beauty of Teignmouth, Colonel W. B. Smith, and Viviand Morel.

Cut blooms were numerous and well up to the average in point of quality. For twenty-four Japanese, in not less than eighteen varieties, Mr. Sturt, gardener to L. Cohen, Esq., Englefield Green, Ascot, was distinctly first with medium-sized blooms of good quality and well staged; Viviand Morel, Edith Tabor, Madame Carnot, Australian Gold, Mdlle. Thérèse Rey, M. Chenon de Leche, Mutual Friend, and Lady E. Saunders were the most noteworthy. Mr. Lane, gardener to Miss Ridge, Ascot, second; Mr. Fulford, gardener to F. D. Lambert, Esq., third. This stand contained the premier bloom of the show, a fairly good one of Madame Carnot. Mr. Lane won the premier place for twenty-four incurved with somewhat small but neat, fresh examples of popular varieties; Mr. Sturt second; Mr. D. M. Hayler, gardener to Mrs. Langworthy, third. For twelve incurved and twelve Japanese, distinct, a silver challenge cup was offered with the first prize; this Mr. Lane secured with good blooms in both sections, and of the following varieties. Incurved—Madame Ferlat, Duchess of Fife, Topaze Orientale, Dorothy Foster, R. Petfield, Mrs. E. J. Murray, C. H. Curtis, Empress of India, Golden Queen of England, Lucy Kendall, and Mrs. R. C. Kingston; Japanese—Oceana, Viviand Morel, Madame Gustave Henry, Charles Davis, Modesto, Hairy Wonder. Mary Molyneux, Joseph Chamberlain, Pride of Madford, and Lady Hanham, Mr. Sturt a close second. For twelve incurved Mr. F. J. Paul, gardener to Mrs. Bowring, won premier position with small but neat blooms; Mr. W. Hull, gardener to Captain Farwell, second.

For twelve Japanese six competed, Mr. J. Wood, gardener to Lord Boston, winning first place with a good set of heavy, fresh specimens. Mr. Wood also secured the leading award for six incurved, one variety, with medium-sized, well-finished examples of C. H. Curtis; Mr. Lane second with Madame Ferlat. In a similar class for six Japanese Mr. Lane with Beauty of Teignmouth won first prize, Mr. Sturt with Phœbus taking the second place. Anemone-flowered varieties were fairly well represented, Mr. W. Cole, gardener to Mrs. E. B. Foster, winning first prize, Messrs. J. Williams and J. Wood taking the remaining prizes. Chrysanthemums cut with long stems and arranged in baskets with foliage are always a feature at this show; this year they were even better than ever. Mr. Lane won the pride of place with really good specimens lightly arranged with harmonious autumnal and other foliage, Messrs. Wood and Sturt following. In a similar class devoted to ladies there was a stiff competition. Mrs. Bargrave Wyborn, Clifton House, Windsor, was a long way ahead of all others with a charming arrangement of bronze and yellow flowers judiciously associated with suitable foliage, Mrs. Young second with a somewhat stiff arrangement, Miss H. M. Sainty third.

Fruit and vegetables were distinct features of the show, so well were they represented; space, however, forbids details. Mr. F. H. Beney, gardener to Lady Mary Caine, Clewer Hill House, staged an interesting group of Nerine Fothergilli major along with Adiantum cuneatum, which was much admired.

BEDFORD, November 10.

FOR some years Bedford was without a horticultural society and without a show. The gap has been filled by the Beds Horticultural Improvement Association, which has sought to justify its name and existence by holding meetings for discussion and providing displays of the local garden produce. The autumn exhibition was held last Thursday, and proved in all respects a great advance on previous efforts. The Corn Exchange devoted to the display is admirably adapted for the purpose, and the honorary secretaries, Mr. Edward Laxton and Mr. W. Kingston, took the fullest advantage of their opportunities to make a bright, varied, and tasteful show.

Ample space was provided for groups, which are seen at their best in such a large and lofty hall, and it is to be hoped that in future years this class will be still further encouraged. The premier award was won by Mr. C. Ellis, gardener to T. H. Barnard, Esq., Pemberley, with an excellent contribution, the plants well grown and healthy, the blooms massive, and the arrangement effective. Mr. Tysoe, gardener to Miss Fitzpatrick, Bedford, was placed second with dwarf plants bearing good blooms, but rather too rigidly tied. The most imposing group, however, was the non-competing one from Messrs. Laxton Brothers, which was one of the best we have seen at a provincial show, the blooms excellent, and the arrangement all that could be desired.

In the cut bloom classes the Japanese forms were by far the best represented, and some extremely meritorious exhibits were staged. The best twenty-four blooms came from Mr. Restell, gardener to F. S. Wigram, Esq., Elstow, very handsome blooms of great substance, the varieties being as follows (only twelve required): International, Viviand Morel, Pride of Exmouth, Mrs. W. Mease, R. Powell, Australie, Mrs. H. Cheeseman, Modesto, Duke of Wellington, M. Chenon de Leche, and W. Seward. Second honours fell to Mr. Hayes, gardener to the Marquis of Northampton, Castle Ashby, who had very bright, fresh blooms, and with a little more substance they would have been easily first. Mr. E. Jones, Bedford, was a good third. For twelve Japanese Mr. Hayes was well to the front, his blooms being even and again excellent in colour, a point too often overlooked now. Mr. E. Jones was second, and Mr. Day, gardener to L. C. Higgins, Esq., Castle Close, took the third place. Mr. E. Jones had the best six Japanese in a good class, the varieties shown being Madame Carnot, Viviand Morel, Edith Tabor, Australie, Mutual Friend, and Phœbus. A non-competing stand of twelve Japanese was staged by Mr. McKinlay, gardener to Earl Cowper, Wrest Park, and for bright colours and clean, even quality they were not excelled by any in the show. Mr. Hayes had the only noteworthy stand of incurved blooms, which deservedly gained him premier honours in the class for twelve distinct. They were fresh, even, and of moderate size, the varieties being Lord Wolseley, Golden Empress, Violet Tomlin, M. Bahaunt, Prince Alfred, J. Doughty, Baron Hirsch, Pink Venus, Mrs. G. Rundle, Prince of Wales, Globe d'Or, and Alfred Lyne.

The floral decorations were an extremely beautiful feature in the show, a row of tables occupying the whole of the centre of the hall, and some highly tasteful designs were contributed by the ladies of the district. A good deal of interest was excited by the awards being determined by the votes of the visitors, each one of whom was furnished with a voting paper. That considerable diversity of opinion was expressed by this method can be easily understood, and the awards were not made known until late in the afternoon.

Apples were well represented in the fruit classes, the leading prizes being taken by Mr. W. Chapman, gardener to T. Barnard, Esq., Cople; Mr. J. Pullen, gardener to Lady Taylor, Turvey House; Mr. Hayes, and Mr. C. Ellis.

Vegetables constituted another important feature, and were shown in admirable condition. Mr. C. Ellis had the best collection of ten sorts, and so excellent were they that a high position would have been commanded at much larger shows. Parsnips, carrots, tomatos, potatos, celery, onions, and beet were models. Mr. Dewell, gardener to C. Franklin, Esq., and Mr. Hayes followed in that order, both showing well-grown produce. There were smaller classes also well filled, and the prizes for onions brought several strong competitors. An extensive and unique collection was contributed by F. Collins, Esq., Bedford, which filled about fifteen feet run of table space, and comprised examples of all the best vegetables in season in first-rate condition. A special prize and certificate of merit were awarded for this exhibit.

NATIONAL CHRYSANTHEMUM SOCIETY.

ON the 14th inst. there was quite an interesting display before the Floral Committee, most of the leading growers exhibiting. Mr. Hall, Prestbury, Macclesfield, showed several Japanese forms. Mr. R. Owen, Maidenhead, showed several new and interesting incurved blooms, Mrs. W. C. Egan and Pearl Palace being notable. Mr. Wells, Earlswood, showed fine flowers of Nellie Pockett, John Pockett, Mr. T. Carrington, and Chatsworth, Japanese; Duc d'Orleans, C. S. Bates, and Mrs. W. C. Egan, incurved. Mr. R. Holmes, Norwich, showed Lizzie Adcock, a golden sport from Source d'Or. The type and three other forms were shown; the new and bright golden yellow sport was passed, however, notwithstanding its bright shade. Messrs. Adams, Howe, Cantley, and Davis also staged flowers. Mr. H. J. Jones, Lewisham, sent some good anemones and Japanese forms, the latter including the crimson variety named J. Chamberlain. Mr. A. Kember, Gosfield Hall, Halstead, showed a splendid yellow sport from Mrs. Dr. Ward; this was commended. Mr. W. H. Witty sent some queer blooms, the variety "What Ho" having long spidery florets; Golden Shower had long tassel-like florets and was very pretty. The committee desired to see the varieties again.

AIGBURTH, November 12.

THIS exhibition fully sustained its reputation for high-class specimens. Chrysanthemums were very fair throughout, Mr. F. Keightley, gardener to Mrs. Duncan, securing the premier award for the forty-feet group with good blooms interspersed with palms, crotons, &c.; Mr. E. Taylor, gardener to E. Pryor, Esq., being second. For three distinct plants and for a single specimen the same exhibitor led the way in each class, winning the latter with a fresh-flowered Chas. Davis.

Cut blooms, as usual, were the most important feature, and this is principally through the generosity of A. L. Jones, Esq., who has provided a splendid silver challenge cup; this was secured by the Liverpool winner, Mr. J. Heaton, gardener to R. P. Houston, Esq., M P., with fine fresh blooms of Japanese—Madame Gus. Henry, Jas. Brookes, Mrs. G. H. Palmer, Australie, Pride of Exmouth, Edith Tabor, Madame Carnot, Mons. H. J. Jones, Graphic, Australian Gold, N.C.S. Jubilee, and Lady Ridgeway; incurved—C. H. Curtis, John Lambert, John Salter, Lord Alcester, Rob. Petfield, Princess of Wales, Lady Isabel, Queen of England, Miss M. A. Haggas, Duchess of Fife, Perle Dauphinoise, and V. Tomlin. Mr. W. Whittle, gardener to G. Allan, Esq., last year's victor, was second. For six incurved and six Japanese Mr. E. Sherlock, gardener to E. Edmondson, Esq., led the way with good blooms; Mr. A. Randall, gardener to A. L. Jones, Esq., second. For six incurved, six Japanese, and three incurved and three Japanese the cup winner again proved his skill by being awarded first in each class. The class for six Japanese shown with their stems and foliage as grown produced a nice display. Mr. T. Ankers, gardener to W. Bowring, Esq., being accorded the place of merit.

In the plant classes Mr. F. Keightley, Mr. A. Randall, Mr. Heaton, and Mr. E. Sherlock were to the fore. The most tastefully arranged hamper, prizes given by Messrs. R. P. Ker and Sons, was shown by Mr. F. Keightley, in which Cattleya labiata and oncidiums showed to advantage; Mr. E. Taylor second.

Fruit was very well shown throughout, Mr. Kelly winning for two bunches of black grapes, and Mr. Dickinson, gardener to H. A. Samuelson, Esq., for two bunches of white grapes with Muscat of Alexandria. For four dishes of apples Mr. Leadbeater led the way; Mr. Bustard second. For four dishes, culinary, Mr. Kelly was again to the fore with Winter Hawthornden, Alfriston, Lord Suffield, and Ecklinville. For eight varieties of vegetables, prizes given by Mr. T. Whalley, Liverpool, the winners were Messrs. G. Leadbeater, A Randall, and F. Field.

SHEFFIELD, November 10 and 11.

UNDOUBTEDLY the exhibition held at Sheffield on the above dates was the most successful held in the City of Blades for a very long time past. We are glad to note that the society is in a prosperous condition, and also that in its schedule it made several new departures. There was an imposing opening ceremony, at which the Lord Mayor (Alderman W. E. Clegg) said he had attended several shows promoted by the Sheffield Society, but, looking at the exhibits that day, he was amazed at the progress in cultivation which had been made. He could quite believe that the exhibition was the finest out of London, and he ventured to think that even London might have to take a back place.

CUT FLOWERS were first-rate, and in the leading open class for two dozen incurved blooms in not less than eighteen varieties the first prize was secured by Mr. C. Crooks, gardener to the Dowager Lady Hindlip, Droitwich, who staged specimens of Duchess of Fife (2), Topaze Orientale (2), Madame Ferlat, Wm. Tunnington (2), J. Agate, C. H. Curtis (2), Miss Dorothy Foster, John Lambert (2), Lady Isabel, Queen of England, Miss V. Foster (2), Lord Alcester, Mrs. Coleman, R. Petfield, Empress of India, Prince of Wales, Golden Empress, and Jeanne d'Arc, the best blooms being those of Topaze Orientale and J. Lambert; Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, second; and Mr. A. Alderman, gardener to J. D. Ellis, Esq., Worksop, third. There was a very keen contest for the leading award in the class for two dozen Japanese blooms, in not less than eighteen varieties, and here the winners were eventually placed as in the previous class, Mr. Crooks scoring with a fine, substantial lot of flowers, the varieties being Simplicity, Mrs. W. G. Palmer (2), Madame Gustave Henry (2), Australie (2), G. J. Warren, Eva Knowles, Madame Carnot, Pride of Madford (2), Ella Curtis, M. G. Bruant, Phœbus (2), M. C. Panckoucke, Modesto, Charles Davis, Edith Tabor, M. Chenon de Leche (2), J. Bidencope, and Mrs. H. Weeks. Mr. Crooks had the best twelve incurved, and Mr. Scott, gardener to J. Colley, Esq., Worksop, the best half-dozen blooms.

Mr. T. Morton, gardener to J. G. Lowood, Esq., Glossop Road, Sheffield, won first prize for a group of chrysanthemums arranged with other flowering and foliage plants, on a space of eighty-five square feet; Mr. E. Austin, gardener to L. Brett, Esq, Chesterfield, was second. Mr. Scott led for three specimens, incurved varieties, for three trained Japanese forms, and also for three pompons; he also scored first for British ferns and a group of primulas, coming second to Mr. Wenman, gardener to Viscount Halifax, Hickleton Hall, for table plants. In the amateurs' plant and group classes Messrs. Glossop, Banham, Walker, and Goodwin were the leading prize-winners.

Mr. F. G. Nelson, gardener to A. Barnes, Esq., Ashgate Lodge, Chesterfield, had the best black grapes; Mr. Alderman second; other winners in the first classes were Messrs. Stocks, J. Smith, and C. Scott.

Some fine non-competitive exhibits from Mr. Nelson, Catcliffe; Messrs. Hiram Shaw and Son; Messrs. Crosland Brothers, Handsworth; Mr. S. Seagrave, Gleadless; and Messrs. W. Artindale and Son, Sharrow Vale; they were attractive, and each gained a special silver medal.

DEVIZES, November 15.

A SMALL but excellent exhibition of blooms of high quality was held in the Corn Exchange on the above date. The exhibition is held by the Devizes Benevolent Society, and is in conjunction with a bazaar, the proceeds being devoted to relieving the necessities of the poor of the town during the winter months. The arrangements of the show as to the staging, &c., were well carried out by Mr. Thomas King, of The Castle Gardens, Devizes, and both staging and judging were got through in great comfort.

Six stands of twenty-four incurved, distinct, competed, and some very fine blooms were staged, especially by Mr. J. Dumble, gardener to Sir C. E. G. Phillips, Bart., Picton Castle, Haverfordwest, who had a well-finished, even collection of large size, chief among them being Madame Ferlat, Miss Dorothy Foster, Duchess of Fife, Ma Perfection, C. H. Curtis, J. Agate, Bonnie Dundee, Golden Empress, Mdlle. Lucie Faure, Queen of England, Violet Tomlin, Lord Alcester, Topaze Orientale, Globe d'Or, &c. Mr. C. J. Salter, gardener to T. B. Haywood, Esq., Woodhatch, Reigate, was second with a very good stand of blooms, though not without a few blemishes; he had C. H. Curtis, John Lambert, Jeanne d'Arc, Flora Macdonald, Queen of England, Ma Perfection, M. P. Martignac, &c.; Mr. W. G. Adams, florist, Clarendon Road, Southsea, was third. Mr. Salter came in a good first with twelve blooms of incurved, having a very even stand of flowers, chief among them Mrs. R. C. Kingston, Madame Ferlat, John Doughty, Globe d'Or, Ma Perfection, C. H. Curtis (of a very deep shade of yellow), Empress of India, Mrs. Heale, Jeanne d'Arc, John Lambert, and others; second, Mr. W. Robinson, gardener to the Right Hon. Lord Ludlow, who had in very good character Bonnie Dundee (of a great depth of colour), Duchess of Fife, C. H. Curtis, Alfred Salter, Madame Ferlat, &c.; third, Mr. R. Bassil, gardener to D. H. Evans, Esq., Shooter's Hill, Pangbourne.

The stands of twenty-four blooms of Japanese were a fine feature. The first prize was taken by Mr. F. E. Vallis, Bromham Fruit Farm, a grower who appears likely to take a high place as a successful exhibitor; the blooms were large, fresh, full, finely-developed, even, and brilliant, the leading varieties being Madame G. Henry, Oceana, Simplicity, Mons. C. de Leche (very free), Phœbus, Lady Hanham, Mrs. G. W. Palmer, Surpasse Amiral, Nina Daubbs, pure yellow, with very broad ribbonlike florets, Swanley Giant, Lady E. Clark, Madame Carnot, G. J. Warren, J. Lewis, Viviand Morel, and others equally good. Mr. C. J. Salter was second, having remarkably good blooms of Mr. T. Carrington, Charles Davis (having a singular depth of colour, approaching chestnut), Viviand Morel, E. Molyneux, President Bevan, Nellie Pockett, Edith Tabor, Mons. Panckoucke, Mrs. J. W. Barks, Elsie Teichmann, John Pockett, &c. Mr. Vallis took the first prize with a stand of twelve incurved Japanese, having a grand lot, chief among them being Mrs. W. H. Lees, Lady Ridgeway, Graphic, Western King, Modesto, Boule d'Or, the new form, Swanley Giant, Oceana, C. A. Owen, &c. Mr. C. J. Salter came second, he staging fine examples of Australie, Oceana, Mons. H. Jacotot fils, Lady Ridgeway, John Pockett, Nellie Pockett, The Convention, and others; third, Mr. F. G. Foster.

In the class for twelve blooms of Japanese, the exhibitors confined to the county of Wiltshire, Mr. H. Clack, gardener to Colonel C. E. Colston, Roundway Park, Devizes, was first, having in excellent character Western King, Edith Tabor, Lady Hanham, Beauty of Teignmouth, Oceana, Madame G. Henry, &c.; Mr. W. Robinson was second. In his stand were Joseph Chamberlain, Madame Carnot, John Pockett, Mons. Hoste, &c.

There were some excellent stands of anemone flowered varieties, Mr. H. Clack taking the first prize with capital examples of Robin Adair, Descartes, John Bunyan, Junon, W. W. Astor, Enterprise, &c.; Mr. C. J. Salter second, whose leading blooms were Delaware, John Bunyan, Descartes, W. W. Astor, Mrs. H. Gardiner, &c.; Mr. W. Robinson third.

The best group of sixty plants, arranged in a circle and forming a bold feature in the centre of the hall, came from Mr. H. Clack; good growth and fine blooms were conspicuous; an edging of dwarf foliaged plants gave a finish to it. Mr. W. Mantell, gardener to Colonel Dunn, Rowdeford, was second; Mr. G. Hillier, The Gardens, Manor House, Market Lavington, third. In the class for a basket of autumn foliage and berries twenty-one were staged, the first prize going to Miss Mabel Brookes, Devizes, Miss Buchanan second, and Miss Spackman third. Great interest seemed to be taken in this class by the numerous visitors. A stand of very pretty pompon varieties was staged by Mr. Salter.

GLOUCESTER.

THIS show, held at the Corn Exchange on the 9th and 10th, was a great success horticulturally. The arrangements were admirably carried out by the indefatigable secretary, Mr. Sidney S. Starr. The total number of exhibits in all departments was four hundred and ninety-five.

There was a grand lot of apples, but several of the best collections and single dishes had been polished too much. Potatos were a good lot, but perhaps not quite so clean in the skins as we have seen them, no doubt on account of the dry summer; other roots were fine, Messrs. J. C. Wheeler and Sons making a grand display.

Chrysanthemums made a grand display, but there was only one class for plants, and that a group. Here Mr. J. Aplin, gardener to W. M. Baker, Esq., carried off the first prize for the fourth time in succession; Mr. Tedmarsh, gardener to W. Cammidge, Esq., second. There were five competitors in the class. For twenty-four cut blooms, twelve incurved and twelve Japanese, Mr. Martin, gardener to T. W. Swinburne, Esq., was awarded the first prize, Mr. J. Aplin the second, and Mr. Marsh, gardener to T. W. P. Batt, Esq., was a good third. For twelve blooms, six Japanese and six incurved, the first prize went to Mr. Sourey, gardener to Sir Hubert Parry, this was a grand lot; Mr. Martin second. For twelve Japanese the first prize went to Mr. F. May, gardener to H. O. Lord, Esq., whose blooms were very fine indeed; Mr. Sourey gained the second prize.

The prize-winners for the collections of apples were Mr. J. Watkins, Mr. T. Morris, Mr. T. Palmer, Mr. Conway Jones (of rose renown), Mr. J. H. Wootton, Mr. D. Phelps, Mr. A. H. Taylor, and Mr. H. C. Organ. For single dishes the winners were Mr. G. Davis, Mr. H. C. Organ, Mr. G. T. Bates, Mr. J. Aplin, Mr. G. Marsh, Mr. F. Cowcher, Mr. E. G. Caddick, Mr. E. F. Bellamay, Mr. J. Watkins, Mr. T. H. Phelps, Mr. Martin, Mr. May, and Mr. Jones, gardener to G. Canning, Esq. Pears were not so largely staged, but Mr. J. Watkins, Mr. Conway Jones, Mr. E. F. Bellamay, Mr. Jones, Mr. G. Davis, and Mr. G. M. Collet took the principal prizes. For the best dish of nine tomatos the first prize went to Mr. Jones, second to Mr. F. Williams, third to Mr. J. Aplin. Mr. F. Williams, Mr. G. Davis, Mr. J. M. Collet, Mr. W. Williams, Mr. T. H. Phelps, Mrs. Bennett, Mr. E. Pool, Mr. Taylor, Mr. Aplin, and Mr. F. Chamberlain, gardener to A. Kuowles, Esq., gained the awards for potatos, while for carrots and parsnips Mrs. Bennett, Mr. F. Williams, and Mr. J. Aplin were the successful exhibitors.

NORTH OF SCOTLAND ROOT, FRUIT, AND VEGETABLE ASSOCIATION.

THE annual show of roots, fruit, and vegetables in connection with this association was held on Saturday, 5th inst., in the New Drill Hall, Inverurie, N.B. The weather was exceedingly fine, and in the new hall and outside grounds the display of produce was seen to the best advantage. The hall is well lighted from both sides, and exhibitors had every advantage in the way which their products were laid out. The usual arrangements had been made by the energetic and obliging secretary, Mr. Alex. Greig, Paradise, Inverurie, who was assisted by a splendid acting committee. The entries were considerably over six hundred, which is an improvement compared with last year.

In the section of the show appropriated to field produce, which was shown outside the hall, rarely have the size and quality of the roots been so uniformly good. Mr. Lawson, Scotsmell, took first place for green-top swedes, his exhibits being of good size and shape and true to name. There were other good entries from Glenlogie and Upper Ingliston. There was a very good display of green-top yellow turnips. Mr. James Reid, Cultray, was first, and Mr. Murray, Fauchfolds, ran him very close. Mr. Murray had the credit of taking first and second places for purple-top yellows with well-grown roots, but the green-top variety took the special prize for the best sample of yellows on the ground. The competition for the best collection of roots was pretty strong; but Mr. Moir, Shadowside, deserved his victory with a well-selected, useful lot of bulbs. In the section for field potatos there were exhibited several exceptional dishes, especially of the long white varieties. The round white class, where Mr. Nicol, Blairbowie, carried off the first prize, was not so large as has been seen at Inverurie, but the three first lots were very fine, the prevalent variety being Regent. Round coloured potatos comprised a number of superior dishes of fortyfolds and round blues, Mr. R. Cowie, Newlands, securing first and second places with good specimens. The long white potatos, in the opinion of one of the judges who has attended the show for over twenty years, was the finest seen at Inverurie. The most conspicuous varieties were the Up-to-Dates, Sutton's Abundance, and the Bruce. Mr. Paterson, Mill of Drumnahoy, was awarded first and second prizes for two very fine dishes of Up-to-Date of perfect shape and quality. It was remarked by the judges that some of the tubers were rather large, as extra size can only be cultivated at the expense of quality in the long run. The meritorious character of the class was evidenced by the fact that the judges gave nearly a dozen commendations. The piece of plate for the best dish in the hall was awarded to Mr. Paterson, Mill of Drumnahoy, for his magnificent Up-to-Date specimens.

Of garden produce there was an exceptionally fine display. For potatos Mr. James Ferguson, gardener to Mr. Craigie, Linton, Cluny, took not only the first prize in the class but the piece of plate with the same potatos for the best lot in the section. There was a fine display of six potatos of any variety, there being no fewer than twenty-four entries.

Fruit was not a large display in the aggregate, but the general quality of the apples was very good. The chief prize-takers in this section were: T. Middleton, Monymusk House; A. Campbell, A. Middleton, A. Beaton, and J. Ogston, Bourtie House.

The display of vegetables, notably leeks, onions, and baskets of vegetables, was the finest that has been seen at Inverurie for many years. For the prize for the best collection of vegetables there was not a large though a close competition, so close, indeed, that the judges had to divide the prizes between Mr. Ogston, Bourtie House, and Mr. Middleton, Manar.

MARKETS.

Covent Garden.

THERE are moderate supplies of most fruits and vegetables, and the demand is good. Green vegetables are inclined to be dear, and potatos remain firm. The best tomatos meet a brisk demand at good prices.

FRUIT.—English apples, 3s. to 9s. per bushel; Nova Scotian, 12s. to 24s. per barrel; French pears, 3s. to 5s. per case, 7s. to 10s. per crate; Californian, 4s. 6d. to 6s. 6d. per half-case; English grapes, 9d. to 2s.; Channel Islands, 6d. to 1s. per lb.; Almeria, 10s. to 16s. per barrel; Spanish melons, 5s. to 7s.; pomegranates, 4s. 6d. to 6s. 6d.; oranges, 10s. to 20s.; lemons, 12s. to 25s. per case; bananas, 5s. to 9s. per bunch; pineapples, 2s. to 5s. each; English tomatos, 3s. 6d. to 4s. 6d.; Channel Islands, 2s. 6d. to 3s. 6d. per 12 lb.; cobnuts, 40s. to 45s. per 100 lb.; English walnuts, 3s. 6d. to 4s. 6d. per bushel; Grenobles, 5s to 6s. per bag.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; chrysanthemums, white and yellow, 1s. to 3s.; eucharis, 2s. to 4s.; gardenias, 1s. to 2s. 6d.; Lilium Harrisi, 5s. to 8s.; tea roses, 6d. to 1s.; pink roses, 3s. to 4s.; red roses, 1s. to 2s.; cattleyas, 5s. to 9s.; Odontoglossum crispum, 2s. to 4s.; and tuberoses, 3d. to 9d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; chrysanthemums, 6s. to 9s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 4s. to 6s. per dozen bunches; stephanotis, 1s. to 1s. 6d.; lily of the valley, 1s. to 2s.; and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—Cucumbers, 3s. to 4s. 6d.; endive, 1s. to 1s. 9d.; lettuce, 9d. to 1s. 6d.; cauliflowers, 1s. to 2s. per dozen; Dutch onions, 3s. 6d. to 4s. per bag; English, 4s. 6d. to 5s. 6d. per cwt.; Valencia, 5s. 6d. to 6s. 0d. per case; eschallots, 1s. 6d. to 2s.; garlic, 3s. per 12 lb.; mushrooms, 2s. 6d. to 3s. 6d. per half-sieve; parsley, 1s. 6d. to 2s.; carrots, 2s. to 3s.; turnips, 2s. 6d. to 3s. 6d. per dozen bunches; celery, 8s. to 12s. per dozen rolls; Brussels sprouts, 2s. to 2s. 6d. per half sieve; spinach, 2s. to 3s. per bushel; potatos, 60s. to 90s. per ton.

Borough Potato Market.

There are good supplies. Snowdrop and Up to Date, 75s. to 80s. per ton; White Hebron, Early Puritan, Bruce, Magnum Bonum, Sutton's Early Regent, Reading Giant, and Imperator, 65s. to 70s. per ton; Blacklands, 60s. to 65s. per ton; Abundance (Scottish), 60s. per ton; Germans, 2s. 9d. per bag.

The mean reading of the Barometer during the week at Greenwich was 29·85 inches, and that of the Thermometer 49°·6, the latter being 5°·4 above the week's average in the 50 years 1841—90. The direction of the wind was south-easterly, the horizontal movement of the air being 49 per cent. below the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 27·2 hours. The measured rainfall amounted to 0·02 of an inch.

ENGAGEMENTS FOR THE ENSUING WEEK.

MEETINGS.

MONDAY, NOVEMBER 21.—National Chrysanthemum Society, Floral Committee.

TUESDAY, NOVEMBER 22.—Royal Horticultural Society: Committees meet at 12 o'clock; Lecture at 3 p.m., by Mr. A W. Hall, Principal of the South Eastern Agricultural College, Wye, on "Artificial Manures in the Garden."

WEDNESDAY, NOVEMBER 23.—Newton Stewart Chrysanthemum Show.

THURSDAY, NOVEMBER 24.—Dundee Chrysanthemum Society; Three days.

FRIDAY, NOVEMBER 25.—Dunfermline Chrysanthemum Show; Two days.
Aberdeen Chrysanthemum Show; Two days.

AUCTIONS.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY, NOVEMBER 21, 22, 23, 24, AND 25—Hyacinths, Tulips, Crocus, Narcissus, Dutch Bulbs, &c., Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.

WEDNESDAY, NOVEMBER 23.—Azaleas, Rhododendrons, Dwarf Roses, Hardy Border Plants, &c., Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.

FRIDAY, NOVEMBER 25.—Imported and Established Orchids, Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.

NEARLY EVERY DAY.—Tulips, &c., Mr. J. C Stevens, King Street, Covent Garden.

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Cypripedium insigne.—I. C., BATH: The flower sent represents a common form of Cypripedium insigne. It lacks breadth in the dorsal sepal, as well as colour and substance in the petals. In some of the best forms the dorsal sepal is very large, and has a large upper area of white; the green portion is finely spotted with varying shades of purple, and these spots are continued in paler form a little way into the white apex. Then the albino forms are, of course, very beautiful and valuable, C. insigne Sanderæ being especially fine.

Introduction of the Fuchsia.—Mum, Otley: The fuchsia was first introduced to cultivation at the end of the eighteenth century, and is supposed to have been brought home by a sailor, who grew it in his window. Here it was discovered by Mr. Lee, a nurseryman, of Hammersmith (the firm of Lee and Son still exists), who purchased and propagated it. The fuchsias of gardens are a very mixed race; in the first place seedlings were obtained from the long-flowered species, and these were crossed, re-crossed, and selected according to the particular end in view of the florist who made them a speciality.

Seedling Apple.—J. W., Sutton Coldfield: It is hardly fair to expect us to form a definite opinion as to the merits of a seedling apple from one fruit, and that a small one. We need some particulars as to the habit of the tree, fruitfulness, stating quantity produced each year if possible; also date of ripening, information with regard to its keeping qualities, and its usefulness for cooking or dessert. The apple sent had been gathered before it was ripe, but if it is a good dessert variety when in condition it possesses some merit, for it also has high colour to recommend it; it is rather a soft apple, however. If full particulars and several specimens are sent we will gladly give an opinion of the merits of the variety.

Wintering Tuberous Begonias.—NOVICE: Lift the plants and remove the remaining growth, shake away the soil, and then allow the stool to dry. The tubers may be shaken quite clean of soil, and then stored in boxes in a temperature of about forty degrees, where no moisture reaches them; or they may be placed closely together in shallow boxes, without having quite all the soil removed, placing fine, dry soil or cocoanut fibre refuse about them. Under these conditions they may be kept in a cupboard or on a cellar shelf until next spring, provided they are kept dry and free from frost. There is no real difficulty in keeping begonia tubers through the winter, provided frost and moisture are kept from them. The difficulty will be to start them into growth early in the spring without the aid of pits or greenhouse, for if left to start at will they are likely to be late in making good plants.

Names of Plants.—T. C., Glastonbury: Fontanesia phillyræoides.

Names of Fruit.—F. J. B., Hartlebury: 1, Withington Fillbasket; 2, Fearn's Pippin; 3, Five-crown Pippin; 4, Warner's King; 5, Ribston Pippin; 6, King of the Pippins.

G. J. W., Farnham: 1, Lord Derby; 2, Mère de Ménage; 3, Egremont Russet; 4, Court of Wick.

S. J. F., Bedford: 1, Fearn's Pippin; 2, Minchull Crab; 3, King of the Pippins; 4, Golden Noble; 5, Dumelow's Seedling; 6, Reinette du Canada.

C. A., Hendon: 1, Histon Favourite; 2, American Mother; 3, Adam's Pearmain; 4, Alfriston; 5, Lane's Prince Albert.

H. C., Hitchin: The pear is Doyenne du Comice; the apple, Old Hawthornden.

S. E. A., Yorks: 1, Flemish Beauty; 2 and 5, we cannot see any real difference in the two specimens sent; No. 2 is Hacon's Incomparable, and if No. 5 is a characteristic fruit it is the same variety; 3, Beurré Diel; 4, Maréchal Dillon; 6, Beurré de Jonghe.

F. H. Pike, Herts: 1, Tom Putt; 2, Cox's Orange Pippin; 3, Dumelow's Seedling.

W. H., Middlesex: 1, Bramley's Seedling; 2, Leathercoat Russet; 3, Lemon Pippin; 4, Dutch Mignonne; 5, Lord Derby.

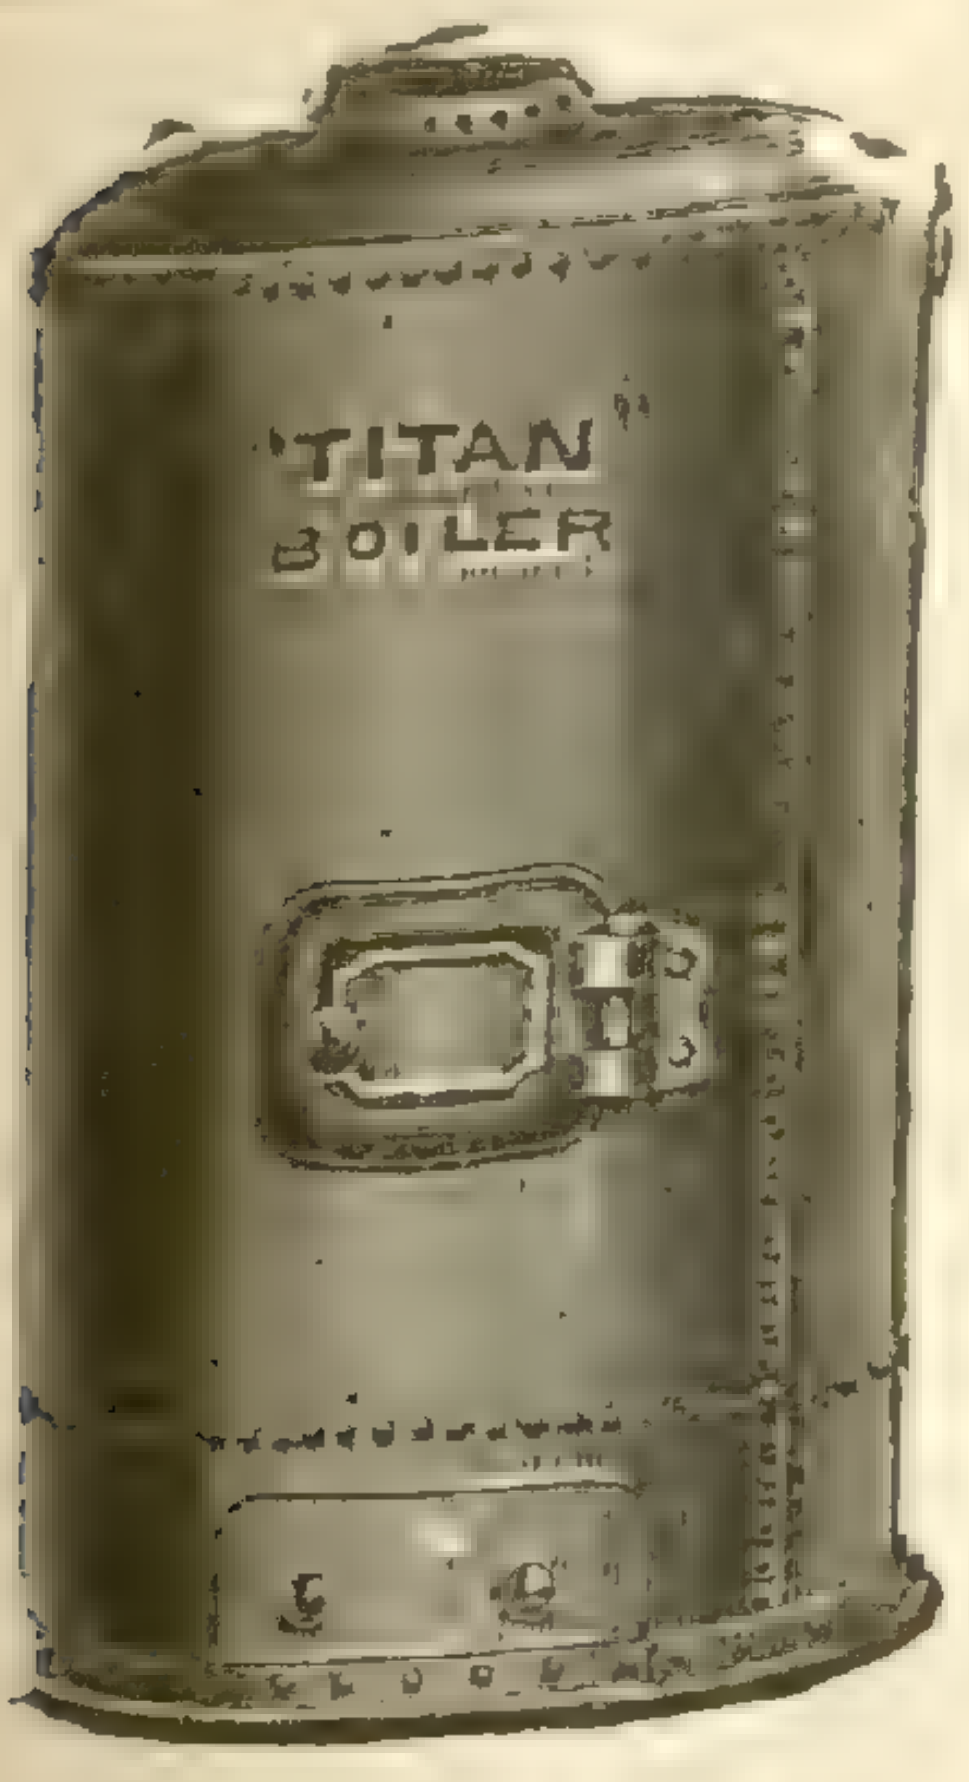
IMPORTANT DISCOVERIES OF GOLD are no doubt of great value to Society, especially at a time like the present, when the money market is so tight and poverty so distressing. Still, however, there are some things in this world far more precious than gold, in spite of the immense influence it wields over mankind. Health, for instance, cannot be purchased for money, but it may be preserved and secured by the use of Holloway's Pills. No family should be without them, as they are equally good in their effects for either old or young. No complaint can for long withstand their healing power. They drive out all impurities from the blood, strengthen the digestive organs, and cleanse the stomach.—[ADVT.]

HEATING APPARATUS.



Our "TITAN" Boiler for large ranges of pipes is unequalled. Estimates for complete apparatus.

JONES & ATTWOOD STOURBRIDGE

Our 1896 Catalogue contains the largest assortment of Fittings, best selection of Boilers, greatest variety of Radiators, Valves, Gratings, &c., of any in the Trade. 460 pages, Free.

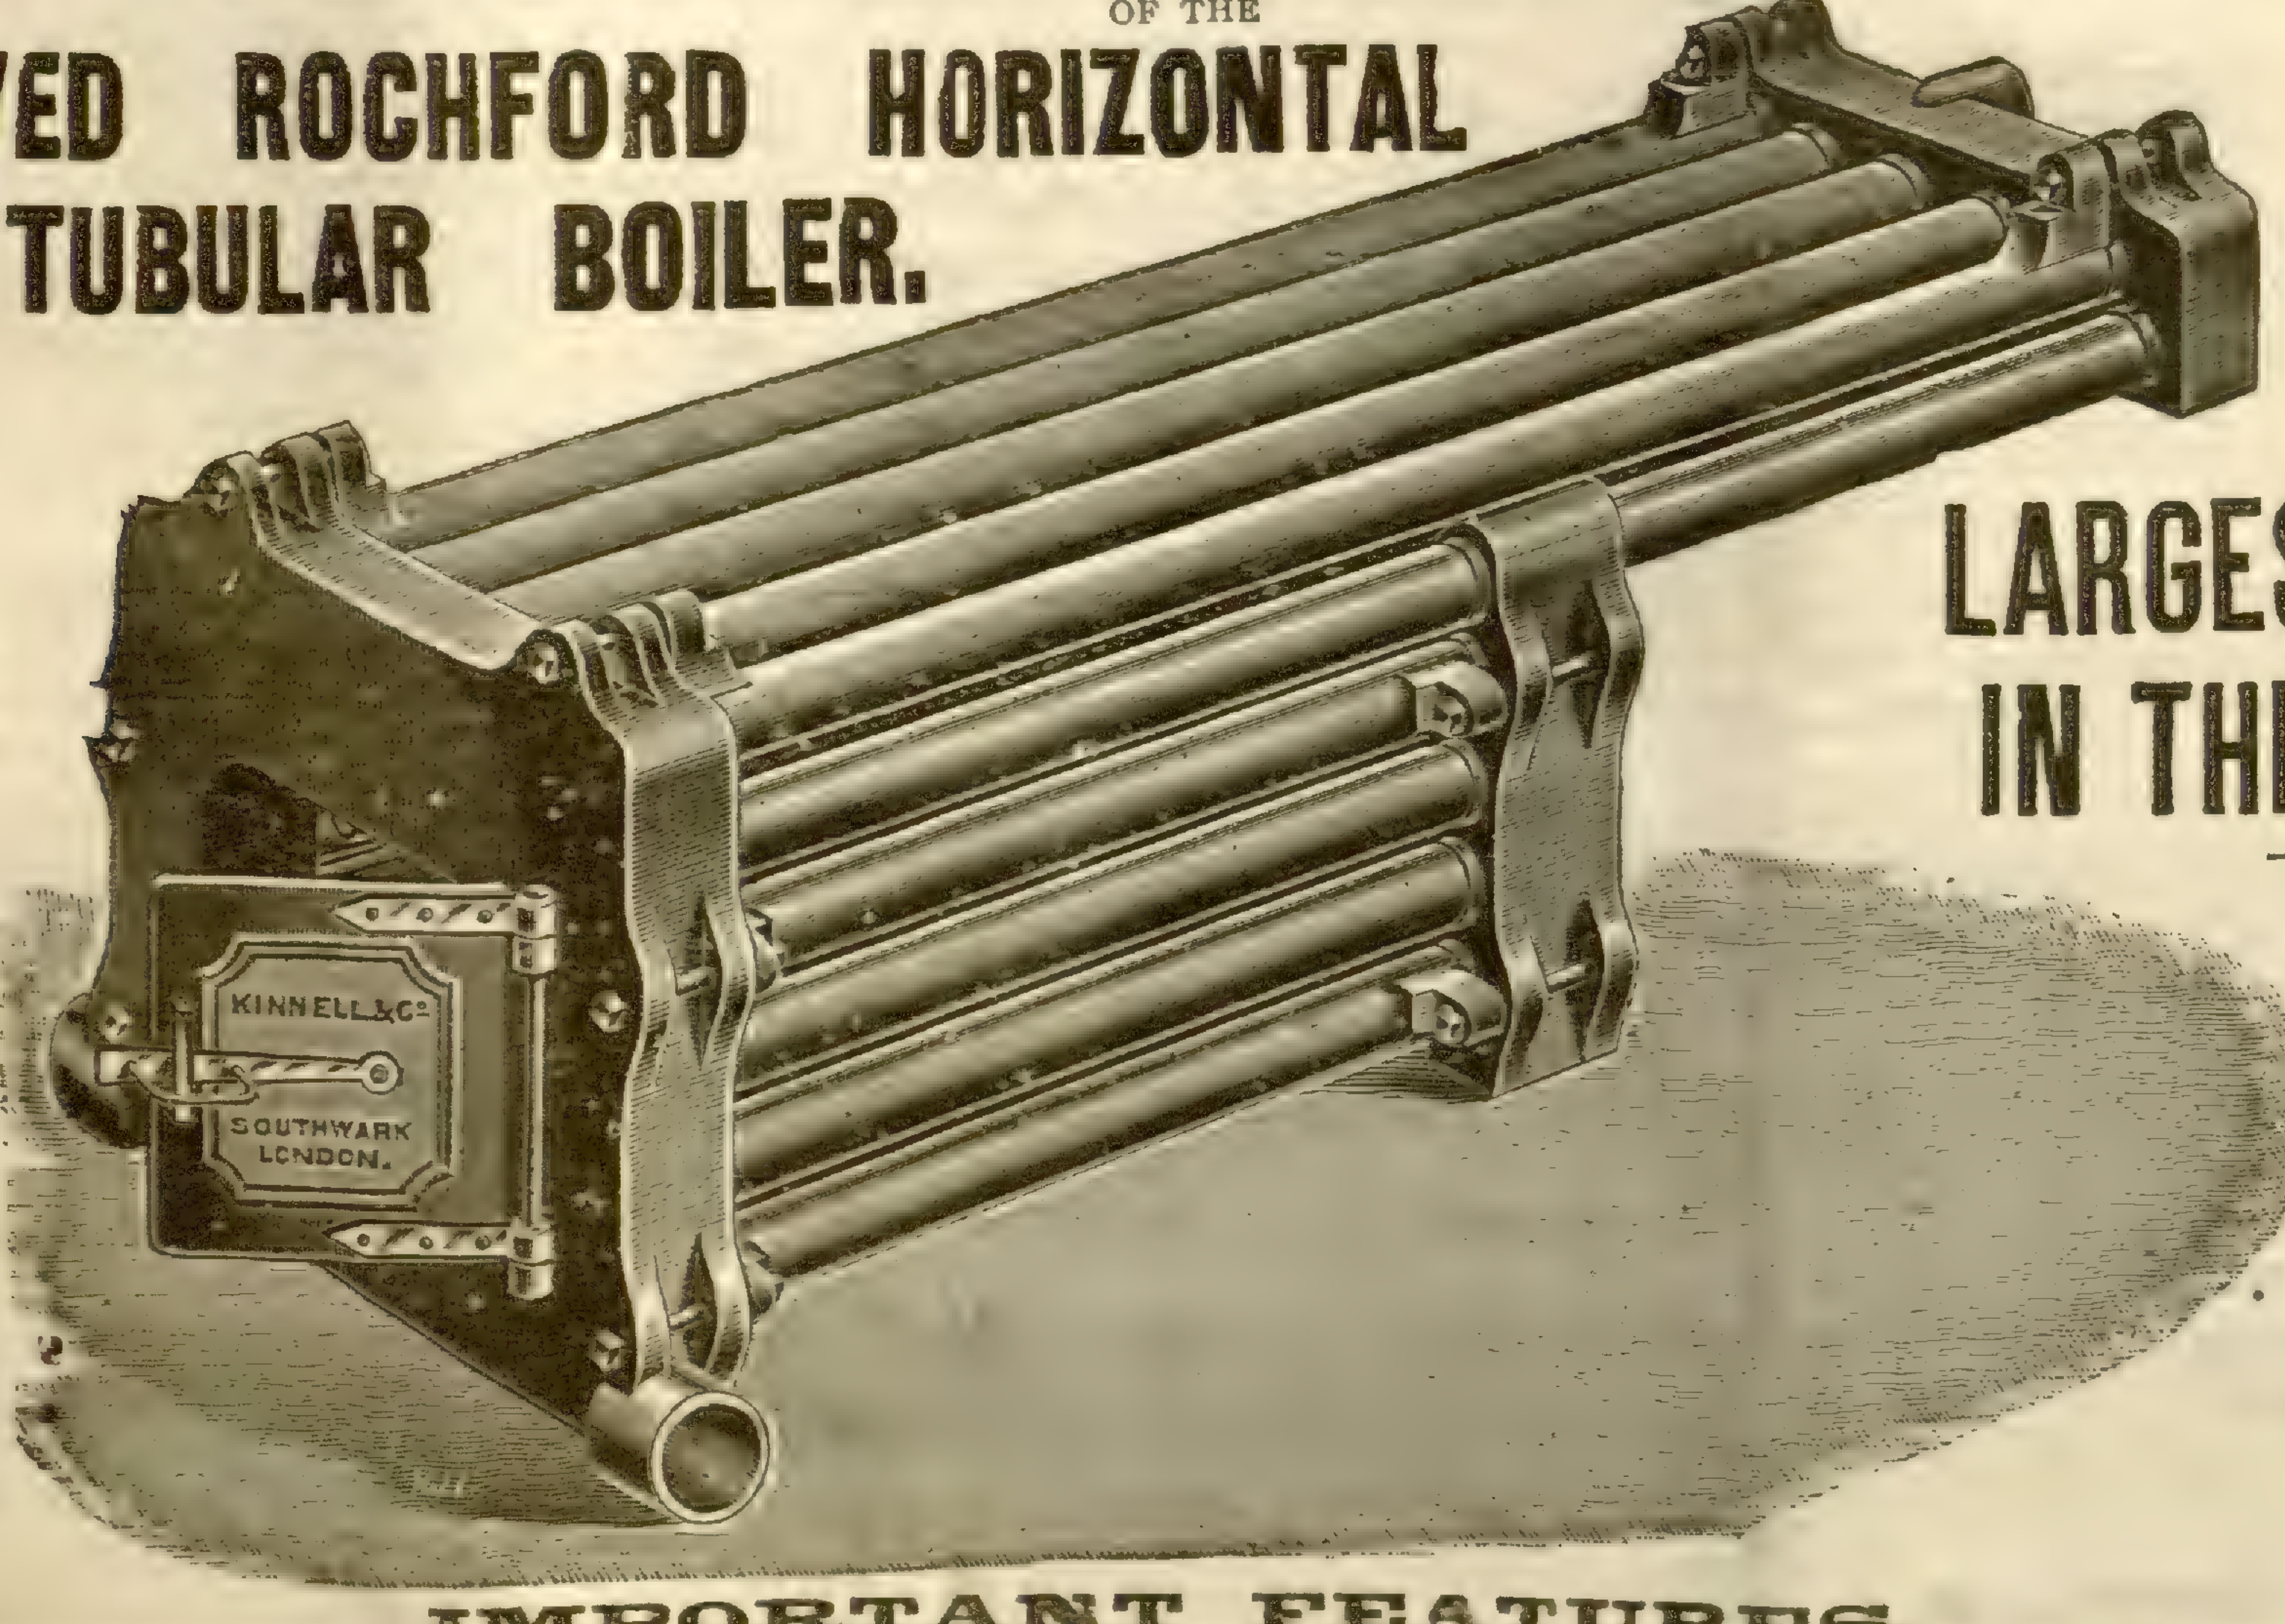
OF THE

IMPROVED ROCHFORD HORIZONTAL TUBULAR BOILER.



Specialities FOR Greenhouse Heating.

LARGEST STOCK IN THE TRADE.

ENGINEERS SENT TO ALL PARTS.

Plans AND Estimates Free.

IMPORTANT FEATURES.

Our invention, by increasing the width of Centre Casting and continued through to the under row of Top Pipes, assures a free circulation of Hot Water from Fire Box to upper rows of pipes. This is important as it prevents concussion of the water in boiler when being sharply driven.

To prevent the possibility of leakage, each pipe is machine faced on flanges, and all turned to gauge.

Tested to a pressure of 60 lbs. in our works before despatch. Full information and prices on application,

Offices and Warehouses, SOUTHWARK STREET, LONDON, S.E.

London: Published at the "Gardeners' Magazine" Office, 4, Ave Maria Lane, E.C., Saturday, November 19, 1898; and may be had of every Newsagent and Bookseller.

CHRYSANTHEMUMS.

BEST RESULTS

Are obtained by starting with healthy country-grown Plants and Cuttings. To prove that GODFREY'S STOCK IS SECOND TO NONE it is only necessary to point to the fact that he has been awarded in one season more Certificates by the National Chrysanthemum and Royal Horticultural Societies for Exhibition Japs than *all other trade growers combined.*

Every bloom so certificated was grown in the Exmouth Nurseries, and had not been "put to be grown," as many frequently are by Chrysanthemum Specialists. Further comments are needless.

CATALOGUES.—Godfrey's Descriptive Catalogue should be in the hands of all, amateur or expert. It contains more *Practical, Reliable, and Interesting matter than any other published.* Post free.

THREE INSERTIONS FOR THE PRICE OF TWO!

AS GARDENER (Head or Single-handed); twenty years' thorough practical experience in all [illegible]; age 35; married, one child; good references.—W. PEARCE, The Gardens, Ewelme Manor, Wallingford, Berks.

GARDENER (Head).—Henry Naylor (late with Spencer W. Gale, Esq., Holywell Park, nearly three [illegible]) is seeking a situation. Previously with Lord Rosslyn and Sir Hugh Adair, Bart. Is strongly recommended in testimonials to lady or gentleman wanting a capable working gardener with reliable character. Age 39; married; no family.—Address Vine Cottage, Meopham, Gravesend.

GARDENER (Head, or good Single-handed); age 30; married; well up in all kinds of Plants, Fruits, and Vegetables; good references.—E. POSNETT, 38, [illegible] Road, Stamford Hill, N.

GARDENER (Head), where two or three are kept; age 35; married; experience in all branches of gardening; good references.—A. HUNT, Hooley Nursery, Purley, Surrey.

GARDENER (Head Working); age 28; life experience in Vines, Peaches, Melons, Cucumbers, Tomatos, Stove and Greenhouse Plants, kitchen and flower garden, &c.; good references.—F. COLLYER, Castle Hill, Rotherfield, Sussex.

GARDENER (Head Working — Scotch), where two or more are kept. Life experience in all [illegible], Inside and Out, including bees. Highest references; [illegible] in last situation.—WM. CLARK, Rose Cottage, B[illegible], Basingstoke.

GARDENER (Head Working), where two or three are kept; age 28; single; good all-round experience.—Address GARDENER, 274, Romany Road, West Norwood.

GARDENER (Head Working) where two or three others are kept; age 27; married; 12 years' good practical experience in all branches; first-class references.—E. STRANGE, The Grange, Hindhead, Haslemere.

GARDENER.—Vicar Highly RECOMMENDS thorough honest, trustworthy Man. Single-handed, or where boy is kept. Age 27; total abstainer; accustomed to glass; excellent testimonials; good 6 years' character; no children.—B. B., Winkfield, Windsor.

GARDENER (Single-handed). Single. Life experience; Inside and Out; age 25 years; good references, also character.—Address C. TANNER, Grove Lodge, Nursling, Southampton, Hants.

JOURNEYMAN (Second or Third), inside, in gentleman's establishment; three years' experience; age 19; good character and reference.—J. REDDING, Holbrook, Ipswich, Suffolk.

To Fruiterers, Florists, Seedsmen and Nurserymen.

MANAGER or SHOPMAN.—Situation wanted as above; experienced in Seeds, Bulbs, Sundries, Plants, Cut Flowers, and Making-up Trade; age 32; good references.—J. MORRIS, 6, Union Street, Andover.

RICHARD SMITH and CO., beg to announce that they are constantly receiving applications from Gardeners seeking Situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

SHOPMAN.—Well up in Seeds, Bulbs, Wreaths, Crosses, Plants, and general nursery stock; good salesman; age 35; twenty-one years with present employer.—F. PRIME, Trumpington, Cambridge.

YOUNG MAN, age 22, seeks SITUATION as Gardener, Second of four, or First of two; understands Vines, Peaches, Tomatos, and gardening generally; abstainer; good references.—H. HODGES, Guy's Cottage, Hollyport, Maidenhead, Berks.

YOUNG MAN (age 20); five years' experience with good firms, desires situation in nursery; would accept small wages if good opening and insight into business to be obtained.—G G, 2, Ramsbury Road, St. Albans.

Situations Vacant.

Advertisements under this heading are charged 2s. 6d. for Four lines (32 words), and 6d. per line of eight words after.

GARDENER WANTED (Single-handed) for Beckenham, Kent; age about 30; must have thorough knowledge of kitchen and glass; grounds three-quarter acre; single man preferred; live out; first-class character indispensable.—Apply by letter only, stating full particulars and wages required, to GARDENER, 107, Cheapside, London.

IMPORTANT NOTICE.

NEW TEA-SCENTED ROSE
"SUNRISE,"
Illustrated and described in Present Issue.

THIS is one of the freest growing and most constant bloomers we have. In fact, it has never been out of flower, under glass, during the six years we have grown it; and is also a good bedder. An Award of Merit was given by the Royal Horticultural Society on October 25 of the present year. The following Extracts from the Gardening Press speak for themselves. Orders have already been received from prominent Rosarians, and we anticipate a large demand.

Extracts concerning Rose "Sunrise."

The Gardeners' Magazine, October 29.

"Mr. G. W. Piper, Uckfield, showed a pretty coppery-buff Tea scented rose named 'Sunrise,' a new form of great beauty."

The Journal of Horticulture, October 29, 1898.

"ROSE 'SUNRISE' (G. W. Piper).—A lovely Tea-scented variety that is deliciously fragrant. The under portion buff-apricot, and the outer side bright cerise (award of merit).'

The Gardeners' Chronicle, October 29.

"Mr. G. W. Piper, Uckfield, exhibited blooms and shoots of a new Tea rose named 'Sunrise, and an award of merit was recommended. It has very pretty little buds, and in point of colour is exceedingly attractive. Some of the outer petals are cerise-coloured, but the blooms have shades of copper and bronze."

The Garden, October 29.

"ROSE 'SUNRISE' (Tea).—This in its colouring, or more strictly combined colouring, is unique, the outer petals reddish-carmine, shading to delicate fawn and pale salmon within, the open blossoms of a pleasing yellow. The chief value of the flower is in the warmer tints that are so abundantly apparent as the flowers open, and these coupled with the bronzy foliage are charming. The flowers, too, are produced in great abundance. the buds being exceptionally well formed. From Mr. G. W. Piper, The Nurseries, Uckfield, Sussex."

Horticultural Advertiser, November 2.

"ROSE 'SUNRISE' (G. W. Piper).—A charming Tea-scented variety, most deliciously scented; a stand of blooms artistically arranged called forth many expressions of admiration. The flowers are salmon-apricot, outer petals bright cerise, the foliage deep bronze, which forms a fine contrast. We have seen the stock growing at home and the plants appeared very vigorous and free-blooming. Award of merit."

Healthy plants in pots will be distributed in May next, price **7s. 6d.** each; or **6** for **£2 2s.**

TRADE TERMS UPON APPLICATION.

All varieties of merit are grown. Our Stock this year is chiefly upon the Seedling Brier, and exceptionally well ripened.

NOTES OF THE WEEK.

CONFERENCE ON CROSS-BRED AND HYBRID PLANTS.

THE projected conference on crossing and hybridising, to be held next year under the auspices of the Royal Horticultural Society, should be one of the most interesting of the gatherings that have been held hitherto at Chiswick. The possibilities in this direction of adding to and embellishing our floral treasures by skilful alliances between them have been so recently recognised that nearly all the results have been obtained within comparatively few years, anterior to which very little was done, and what was effected was mainly of an experimental character, and not on the strictly selective lines now adopted. It is, however, devoutly to be hoped that the exhibition will be subjected to stringent rules that the parentage of the crosses and hybrids be represented in every case, as far as possible, by the plants themselves, *i.e.*, the two parents and their joint offspring, so that the outside student may be able to see how the dual characters have combined. Without such evidence the known sportiveness *per se* of many plants might lead to the belief that no cross had been effected, while with it the show, apart from the benefit of the conference itself, would afford a grand object lesson in that mysterious capacity of the tiny pollen grains of one type of plants to transmit that type wholly or partially to a different one or to deftly arrange a middle course and combine the two without masking either. From the florist's point of view very few plants are ideally perfect, and it is often the case that when the flower itself is all that can be desired the habit of the plant handicaps it as regards pose or prominence, and the fault is so obstinately transmitted that the merely selective breeder fails to eliminate it. The question now arises, what nearly related species is there which, though with less attractive bloom, possesses the requisite carriage? Possibly this virtue lies in some new importation, or it may be in an old and little appreciated one. An alliance is effected, and the desired habit obtained, and if the flowers of the hybrid leave something to be desired that is soon bred out, and the long wished for combination is obtained. There is much to be learnt as regards the partial or entire sterility of the hybrid or crossed plants, and the conference would afford a splendid opportunity of bringing to a centre an immense amount of unrecorded knowledge in this direction and others which is now scattered about among the hybridists, many of them doubtless can more deftly and more efficaciously apply the pollen of one bloom to another than they can fertilise a sheet of blank paper with thoughts from their pen. A systematic schedule of points to be answered would facilitate the obtaining of this floating wisdom in a concrete form. There is far too wide a gap even yet between the scientist, with his intimate knowledge of the inner mysteries of plant organisation, and the man who handles those plants as living beings and studies their habits and peculiarities from a different point of view altogether. Each has his own particular mass of data of inestimable value, but of a different class, and it is precisely such conferences as the projected one which bring the two elements together, and afford the opportunity for that hybridisation of ideas to which mankind has often been hugely indebted.

FLORAL ARRANGEMENTS.

THOSE who fully recognise the value of demonstration at public exhibitions of the arrangements by which the various classes of flowers can be the most satisfactorily employed in the adornment of the home can hardly have failed to note with gratification the prominent position that floral decorations have now assigned them in the schedules of the leading societies, more especially those intimately associated with the chrysanthemum. During the season now brought to a close the arrangements of cut flowers formed at some of the more important gatherings a feature so large and attractive as to constitute of themselves an exhibition of considerable importance. More especially was this the case at the shows held at the Royal Aquarium and Hull; and, without instituting comparisons as to the relative merits of the respective displays, which for our present purpose are wholly unnecessary, the National and Hull societies may be heartily congratulated on the success they have achieved in their efforts to encourage taste in arrangement, in conjunction with their endeavours to improve cultural skill. We make special reference to the work of these societies because of the lead they have taken in the development of the decorative aspect of the chrysanthemum and the opportunities their exhibitions afford for gauging the public taste. At Hull the dinner tables and other decorations are sufficient to fill a hall large enough to accommodate a moderate-sized exhibition, and here we find much to admire and something to criticise. The dinner tables are invariably so tasteful as to disarm criticism, but in the classes for epergnes and other arrangements that are intended to be seen from all sides we find, as at many other shows, the objectionable practice of facing. The exigencies of space compel the executive to place the decorations on side tables, and, knowing the positions their arrangements will occupy, the exhibitors proceed to so arrange the flowers that they will present a pleasing appearance to the visitor as he walks round the room, while the other side of the receptacle is practically bare of flowers. They wholly overlook the fact that judges who understand their duties know that a vase, a basket, or an epergne, intended to stand upon a table, it may be in the centre of a room, should present an equally attractive appearance on all sides, and that they are careful to determine whether the arrangement complies with this essential condition. It consequently follows that "faced" arrangements, which seen from the dressed side are pleasing to the eye, occupy a low position, much to the surprise of the exhibitor and those who content themselves with a superficial glance at the objects exhibited. The practice of "facing" was also in evidence at the National Chrysanthemum Society's show, and greatly marred what would have been beautiful arrangements had they been completed, and some endeavour should be made to impose an effectual check upon it. The prizes are offered for the purpose of encouraging taste in the arrangements of flowers for certain purposes, and if the objects are so dressed as to be rendered unfit for these purposes harm is of necessity done by awarding prizes to them. Hand bouquets also have in many instances been so defective as to suggest the desirability of more stringent regulations with regard to them. A hand bouquet should, of course, be so arranged that it could be carried by a lady, but in not a few cases bouquets that had an attractive appearance on the exhibition table have, on being lifted out of the receptacle, been found to have handles so big that no lady could hold them, and in some instances a portion of the material so loosely fastened as to fall away when the bouquet was handled. This touching up should be checked, and there is no better way of imposing a check than to handle the bouquets, and to determine their relative merits after this has been done.

ARTIFICIAL MANURES.

ARTIFICIAL manures are now so largely used in the production of garden and farm crops that the desirability of the general body of cultivators becoming fully acquainted with the properties of the several kinds and their effects upon the various forms of vegetation under the widely divergent conditions of soil and climate does not admit of question. Hence the lecture by Mr. A. D. Hall, M.A., on artificial fertilisers before the Royal Horticultural Society on Tuesday, was of special interest to both scientific and practical horticulturists. Mr. Hall, who has accomplished much valuable experimental work in the college gardens at Wye, and on the hop farms in Kent, stated in his opening remarks that farmers are considerably in advance of gardeners in their knowledge of artificial manures, and, although we are unable to accept the statement unquestioned, we are in full agreement with him that much has yet to be learnt with regard to their profitable utilisation in the garden. We have given expression to our views upon this point on more than one occasion, and we have endeavoured to assist our readers in the acquisition of knowledge upon this aspect of garden management by obtaining the co-operation of some of the highest authorities, as our pages so amply testify. The use of simple manures was recommended in preference to mixed manures, because of the difficulty, when the latter are applied, in determining which of the several constituents have produced a favourable or unfavourable effect upon the crop. But this advice must be taken with some reserve, for, were cultivators to act upon it, many waste products now utilised with much success by gardeners and farmers would have to be removed from manufactories at a considerable cost instead of being a source of profit ; and if this does not immediately concern cultivators it would indirectly affect them, as any material reduction in the supplies would have a tendency to raise the prices of the simple fertilisers. There is, of course, much to be said in favour of simple manures, and they can, of course, be used with advantage as supplementary to fertilisers of a more general character. Mr. Hall suggested that except nitrogen, phosphates, and potash there was nothing worth buying, and to a certain extent this is true, for in a general statement of the case these are the only food constituents that the cultivator need apply to the soil. At the same time it would not be wise to base an estimate of the money value of farmyard manure on the percentage of these constituents, because of the usefulness of humus derived from decaying organic matter in the retention of plant food in the soil and the conservation of moisture. As we understood Mr. Hall, he did not suggest that the value of farmyard manure should be determined in this way, but he did not show how greatly the latter differed in its effects from artificials. The several artificial fertilisers were passed under review with remarkable lucidity, and it was pointed out that, while nitrogenous manures had the effect of greatly stimulating the production of leaves and growth generally, the phosphatic fertilisers, such as superphosphate of lime and basic slag, and potassic manures, of which kainit is best known, are of special value in building up the tissues, and in the production of fruits and roots. The value of applications of sulphate of ammonia and nitrate of soda to such crops as cabbages and lettuces early in the spring was pointed out, and cultivators were warned against using these in excess, and thus promoting a soft growth, this advice having special application to those who have to send the produce long distances, as, for example, to the market or town house. Mr. Hall referred to the value of nitrate of soda as a spring dressing for strawberries making but little leaf growth, and gave some interesting particulars of the experiments he had carried out. The importance of systematic experiments was insisted upon, and it was shown how much might be accomplished in this direction by cultivators with but little trouble or expense to themselves.

Gardeners' Magazine Christmas Number.—We have much pleasure in announcing that our Christmas number, which will be published on December 17, will be of special interest, and fully maintain the popularity of our issues associated with the Christmas season. Mr. F. W. Burbidge, M.A., will deal with the literary and historical aspects of the nelumbium ; Mr. Norman Brown will relate the adventures of a pretty Parisian bouquetière ; Mr. George Gordon will discuss the rise, decline, and the revival of an old gardening art that was at the zenith of its popularity in the days of "Good Queen Bess," and will give illustrations of some unique examples ; Mr. G. Nicholson, A.L.S , will contribute an article on the horticultural aspects of the Riviera, which will be illustrated by reproductions of a series of photographs taken by Henry Little, Esq. ; Mr. R. Dean will take us back to the days when Chiswick was the chief centre of horticultural activity, and accompanying his paper will be several illustrations that may be described as unique ; Mr. J. R. Jackson, A.L.S., Lux, Jack Bowser, and other writers will contribute to the issue, with which will be presented a beautiful almanack printed in colours, illustrative of the Penzance briers.

Potato Experiments.—During 1897 and the present year experiments have been carried out at the Cheshire County Council's horticultural school, and the report of the experiments received from Mr. J. G. Gordon, principal of the school, is of much interest. The first experiment was one testing the productiveness of a great number of varieties, and the results of 1898 were strikingly similar to those of 1897. In both seasons the most productive of early round varieties was Early Market Favourite, while Challenge was the heaviest cropper of early kidneys, British Queen of second early kidneys, and Up to Date of late varieties, followed by Hough Giant, County Councillor, Hough Abundance, Cheshire Delight, and Maincrop, in the order given. Up to Date is credited with the enormous crop of over 21 tons 3 cwt. per acre, and Hough Giant with a yield over 20 tons 4 cwt. A trial with cut sets against whole sets gave no decisive results. In an experiment with seed tubers of different sizes there was a steady increase of yield, from that of tubers that would pass through a sieve with one and a-half inch mesh, but not through one of one and a-quarter inch, to that of tubers which would not pass through a two and a-half inch mesh. There were three intermediate sizes. The largest seed tubers gave more than double the yield obtained from the smallest. In the manuring experiments, as farmyard manure was applied to every plot, the results indicate the relative values of extra artificials. The greatest yield was obtained on a plot dressed with three hundredweight of superphosphate, one hundredweight of sulphate of ammonia, and one hundredweight of muriate of potash, in addition to fifteen tons of farmyard manure, and the profit from the use of artificials was also greatest in this case. Sulphate of ammonia did better than nitrate of soda, and muriate appeared to be much the best form in which to apply potash.

Vases of Chrysanthemums.—M. Fatzer, who is one of the most successful of the cultivators of chrysanthemums in France, surprised the visitors to the recent exhibition at Paris by his magnificent vases of blooms. The latter were similar in development to those seen at British exhibitions, and presented a striking contrast to those staged by the majority of the exhibitors. M. Fatzer was awarded a large silver-gilt medal for his vases of chrysanthemums, and for his grapes he received a gold medal.

Proposed Winter Garden for Brighton.—It is proposed to erect a winter garden on part of the site of the Brighton Aquarium, and particulars of the scheme were recently laid before the committee of the Town Council, which body has, by Act of Parliament, certain rights of veto in regard to constructive alterations of the Aquarium. The committee were informed that a syndicate proposed to purchase the Aquarium from the liquidators of the company, and by a liberal expenditure, estimated at £30,000, and the introduction of many new features, including a winter garden, to make the altered and enlarged Aquarium a thoroughly attractive "all day" pleasure resort, available under all conditions of weather. Several new entrances will be provided, and on the eastern portion of the present Aquarium roof a light iron and glass roof is to be formed, extending for a length of about three hundred feet. At the western end of the building a covered portion would be provided, which would be available for the public, virtually forming a covered seat and shelter. In acknowledgment of such concessions as may be necessary, the syndicate offer to afford facilities for widening the Marine Parade, adding an area of 1,350 yards, particulars of which have already been published. The committee have unanimously advised the Council to allow the scheme to proceed.

The National Chrysanthemum Society's Annual Dinner will take place at the Holborn Restaurant, High Holborn, W.C., on Wednesday, November 30, at 6.30 sharp. Sir Albert Kaye Rollit, M.P., has kindly consented to take the chair on this occasion. The challenge trophy, Holmes and Turner memorial cups, medals, &c., won at the great November show, will be presented to the winners during the evening. Tickets, exclusive of wine, are 5s. each, and may be obtained from Mr. Richard Dean, V.M.H., Ranelagh Road, Ealing. On the occasion of this annual dinner ladies will be for the first time admitted, and their presence is most desirable.

Botanical Appointments.—Dr. G. Klebs has been appointed Professor of Botany and Director of the Botanic Gardens at Halle, while his successor at the University of Basle is Dr. W. Schimper. Mons. C. Sauvageau has been appointed Professor of Botany to the Faculty of Sciences at Dijon. Professor L. M. Under wood has been elected president, Professor B. L. Robinson vice-president, and Professor G. F. Atkinson secretary of the Botanical Society of America for the ensuing year.

Chrysanthemum Congress at Troyes.—The congress and exhibition held at Troyes, under the auspices of the National Chrysanthemum Society, was a splendid success. There was a large gathering of those who take an interest in the chrysanthemum, and considerable regret was expressed that the leading English authorities on the chrysanthemum were, in consequence of their numerous engagements, unable to be present. The jury had for its president M. de la Rocheterie, and for its secretary M. Debrie ; and between one hundred and fifty and two hundred seedlings were submitted for inspection. On the completion of the labours of the jury the members were entertained at a banquet, at which, among other notabilities, M. Viger was present, and conferred upon several of those present the Order of the Merit Agricole and of Public Instruction, amongst those receiving the distinction of an Officer of Public Instruction being M. Charles Ballet. At the close of the banquet the congress was declared open, and in the course of the proceedings a lecture was given by M. Chifflot on the insects and fungi by which chrysanthemums are attacked ; and M. Dauthenay discussed the question of races. The second meeting was devoted chiefly to the consideration of the question of preparing a catalogue of chrysanthemums ; and M. de Meulnaëre, of Ghent, defended with much vigour his system of arranging the names, which consists in giving the surname first. After several hours' discussion it was decided to adopt this plan in the new catalogue to be prepared by the French National Chrysanthemum Society. It was decided to hold next year's congress at Lyons.

National Dahlia Society.—This society will bring its year's work to a close on December 13, when the annual meeting will be held at 2 p.m , at the Horticultural Club. The business will include the preparation of next year's schedule and the revision of the select list of cactus dahlias.

Ramie and Rhea Fibre.—At various times, and especially in connection with Dr. Morris's lectures upon fibres and fibre plants, we have referred in these columns to the great possibilities that lie dormant in ramie and rhea fibres, the chief difficulty being the absence of a suitable machine for the decortication of the fibrous stalks in a cheap and efficient manner. Time, however, works improvements, and it now appears that we are really at the commencement of a profitable industry in these beautiful fibres from which such strong and yet delicate structures can be manufactured. Mr. Ferguson, of Brighouse, who for many years has been experimenting with a view to solving the difficulties attending the production of ramie, has worked out a machine that is simple, effective, and cheap. Mr. Ferguson's invention has been examined by many experts, who are apparently all agreed that it is a success. Some considerable capital is needed to give this new industry a good start, and when this is raised we shall watch with interest the development of ramie fabrics.

A Mild November.—Until the 22nd inst. the month of November was very mild, and such comparatively tender plants as zonal pelargoniums were to be seen flowering freely in many a garden. Writing early in the present week from Great Amwell, a correspondent states that the following subjects, exclusive of such as chrysanthemums, hellebores, Jasminium nudiflorum, &c., such as one expects to flower at this season, were blooming freely in his Hertfordshire garden on the 19th inst. : Dianthus, mignonette, Lobelia cardinalis, blue lobelias (varieties of L. erinus), gaillardias, scabious, pentstemons, stocks, tritomas, vincas, roses, polyanthuses, pansies, auriculas, Daphne Cneorum, rudbeckias, primroses in variety, campanulas, hepaticas, geraniums, antirrhinums, hypericums, a passiflora, Phlox Drummondi, Primula Cashmeriana, Tropæolum tuberosum, Cyclamen hederifolium, and Anemone japonica. On the 5th inst. he gathered some very good flavoured fruits of Viscomtesse Hericart de Thury strawberries, and some roses of quite summer excellence from that superb variety Augustine Guinoisseau.

St. Petersburg International Horticultural Exhibition.—A supplement to the schedule of prizes offered for competition at the international horticultural exhibition to be held at St. Petersburg in May next has been issued. The supplement includes several new classes for orchids, two classes for carnations, and a class for a collection of tea-scented and hybrid tea roses, and one for new roses.

A Plant Protection Station has been established at Freihafen by the State of Hamburg, and under the direction of Dr. C. Brick. Here shipments of living plants from abroad will be examined for the purpose of preventing injurious insects from entering the state. The station authorities will also undertake the inspection of orchards and vineyards in the Hamburg district, overlook the schools of viticulture, and investigate plant disease, with a view to successfully combating them.

Commons Preservation Society.—Under the presidency of Mr. Shaw Lefevre the Executive Committee of this society met on Monday last, when it was stated that two actions in which the society were interested had been satisfactorily decided by the Court of Appeal. The first referred to a prosecution instituted by the lord of the manor against a labourer for cutting underwood upon a turf fuel allotment set out under an Enclosure Act, at Egloskerry, in Cornwall It had been held by the Appeal Court that the lord of the manor had been fully compensated for all his interests in the enclosed common by the allotment made to him, and that he had no part or share in the fuel allotment, the soil of which was held to be vested in the churchwardens and overseers of the parish. The second action was with respect to Towyn Trewan Common at Llanfaelog, Anglesey, 1,300 acres in extent, upon which it was sought to erect an explosives manufactory. An injunction, confirmed by the Court of Appeal on Friday last, had now been obtained, together with a declaration of the rights of the commoners, which would save the common from the possibility of further encroachments. It was stated that the War Office was purchasing Donyland Heath, near Colchester, for the purpose of a rifle range. The society had appealed to the Department to make by-laws under the Military Lands Act, 1892, so that when the land was not in actual use for military purposes it should remain open to the public as heretofore, and they asked that a recreation ground should be given to East Donyland. since the heath, an exceptionally beautifully-wooded open space, was the only land in the district available for purposes of recreation. Upon the motion of the chairman, seconded by Sir W. Vincent, a hearty vote of thanks was accorded to Mr. E. N. Buxton, one of the earliest members of the society, for his recent munificent gift of an additional twenty-eight acres of land at Yardley Hill, Epping Forest, to the Corporation of London. The society is further increasing its usefulness by advising local authorities and private individuals in upwards of fifty cases of encroachments upon common land, open spaces, roadside wastes, and obstructions of rights of way in different parts of the country.

Chrysanthemum Shows at Public-houses.—A correspondent to a northern contemporary writes : "We are not ultra pious in Halifax, like Huddersfield. We do allow our people to enjoy the benefits of the tram on Sundays, and save their legs, but still we are likely to earn a very unenviable reputation if chrysanthemum shows are to be held in public-houses on the 'Sawbuth.' It seems to me that the trade are getting to desperate straits when the beauty of nature is to be caged within the four walls of a liquor den to draw custom on the day of rest."

Chrysanthemum Rust.—With reference to this disease Mr. W. M. Cameron writes :—Any information respecting the chrysanthemum rust has been eagerly sought after during the past two months in the GARDENERS' MAGAZINE by nearly all Guernsey growers of the Autumn Queen. It has shown itself here for the first time this year, and there are very few collections, if any, that have not been attacked throughout the island, whether large or small, grown in pots or planted out. In some cases the stems are quite naked, and the rust has attacked them as well. It has been so virulent in one or two instances that the foliage has been absolutely destroyed in a month from the time it was first noticed, and the flowers, of course, are useless. The varieties most infected were The Queen, Souvenir de Petite Amie, Modesto, Admiral Sir T. Symonds, Niveus, Stresa, Mdlle. Lucie Faure, Yanoma, Phœbus, and Miss Ethel Addison. Spraying with petroleum—about a wineglassful to two gallons of water—has had but little effect, if any, in checking the progress of the disease. Yet some of your correspondents say that they have got rid of it with a petroleum mixture, but a much weaker solution than above. The prevailing opinion seems to be that it cannot be killed, and the best way to combat the disease is to use fungicides during the growing season, either as a spray or a powdery dusting, as a preventive. At least, this was the conclusion arrived at by the Guernsey Gardeners' Mutual Improvement Association at a meeting on the 8th inst.

Botany in the Board Schools.—The London School Board has sanctioned the payment to Her Majesty's Office of Works of 24s. a week for the remuneration of a gardener in one of the Royal parks for providing Board schools with specimens of plants and flowers, with a view to teaching botany in accordance with the method followed in the Berlin elementary schools. We trust that British plants will be those most extensively used and studied.

A MORNING MIXTURE.

Diluculo surgere saluberrimum est.

THINGS are coming to a pretty pass. Amongst my voluminous correspondence, no small portion of which is on gardening matters, there is quite a chorus of complaints about the unexpected forms in which the chrysanthemum rust is causing trouble. The principal grumblers just lately have been officials connected with shows, whose manifold distractions have been materially increased by the reluctance of timid growers, who have hitherto escaped the plague, to come forward, for fear of their exhibits being contaminated by others from stricken collections. One cautious spirit seems to have gone so far as to demand a written undertaking, worded in awe-inspiring legal phraseology, that if the disease should appear in his collection within six (6) months of the date of the show the sum of ten pounds (£10) shall be paid over to him by way of compensation.

I need not enlarge on the terrors of committeeship if this sort of thing extends. They are quite formidable enough now, when the rampaging of the go-ahead member, the prolixity of the argumentative member, and the dismal forebodings of the pessimistic member are all weighed up. But all this will be as nothing when writs and judgments begin to circulate. There will be arguments à certiorari, habeas corpus, and all sorts of other strange monstrosities. Recalcitrant treasurers will be making up their balances in Holloway. I do not know what reply was sent to the cautious spirit referred to. Perhaps the undertaking was given. Or perhaps the committee offered to compromise by supplying a quarantine station. But the incident is proof enough of the alarm which the spread of *Hardbrediana Peteri* has caused. Fortunately, blooms may be considered immune, so that exhibitors of cut flowers need have no apprehensions.

I have a nut for Mr. Massee to crack. The rust has appeared on outdoor plants. I exceedingly regret that I am not permitted to give particulars of the place, but on this point the victim is inexorable. He is a nurseryman, and is very anxious that the fact of his having the disease on his establishment shall not be advertised, for reasons that are easily understood. Nevertheless, my statement is absolutely accurate. The incident seems to me to be a very significant one. What, for instance, about the overcrowding theory? The plants are dotted in a mixed herbaceous border. I beg to direct Mr. Massee's careful attention to this new phase. Readers will, I feel sure, be desirous of hearing whether he is disposed to modify his previous opinion in view of this new factor. In conversation with the grower I raised the question of overcrowding in the early stages of growth, before the plants were put out, but this is strenuously denied.

I have been trying to get in a paragraph about the Crystal Palace Fruit Show, but I fear it is rather belated. Nevertheless, it is by no means out of season, inasmuch as it relates to the date of the exhibition. While Peter and I were perambulating the Palace on the opening day we were told by several of the principal exhibitors that the date was too early for them. They would prefer it a fortnight or three weeks later—the latter for choice. I do not know if this is the general opinion, but in any case the point is worth ventilating. There may be reasons against it which the management alone are aware of ; if so, the mention of them would do no harm. It is not to be supposed that the R.H.S. can do as it likes with a great place of public entertainment such as the Crystal Palace. The latter has its other affairs to consider.

I noticed a paragraph a few weeks ago from the pen of Mr. W. A. Cook relating to Messrs. Carters' splendid new potato, Snowball. I say from Mr. Cook, but I am trusting to memory. In any case I beg to add a word by way of corroboration. Snowball has not only won a great many prizes this year, but it is proving to be a great cropper and of good flavour. I am the more disposed to refer to the variety because of the fact that it is one which I had selected to put to the test the point alluded to in the MAGAZINE some time ago, namely, the property of mixtures containing muriate of potash of causing waxiness. No such difficulty has occurred. I am not by any means sure that the muriate is the best form of potash, because, as I mentioned some time ago, I have had some most excellent results from the sulphate, but I certainly cannot trace waxiness to the muriate.

In the issue of October 22 I observed an editorial reply to a question about paraffin wash. With the advice to use the oil in the form of an emulsion I cordially agree, but when I consider the proportions I am induced to wonder which of three things is correct—(1) An error on the part of Mr. Printer ; (2) excessive weakness of Maryland petroleum ; (3) extreme tenderness of the Luxian trees. I see that the proportions advised by the Experiment Station are, in the first place, half a pound of soft soap, a gallon of water, and two gallons of paraffin, the emulsion to be subsequently diluted with ten to thirteen gallons of water. Our trees won't stand anything like this. Perhaps we surface cultivate them too much, and certainly the digging atrocity is practised amongst them. I find that a pint of petroleum (with a pound of soft soap made into an emulsion) is quite enough for fifteen gallons of water. It seems weak—ridiculously so, compared with the American formula—but it does its work.

LUX.

[Not "*the* emulsion," Mr. "Lux," but "every gallon of the emulsion used should be diluted with from ten to thirteen gallons of water," thus making from thirty to thirty-nine gallons of wash.—ED.]

NEW PLANTS AND FLOWERS.

CYPRIPEDIUM WOTTONI.

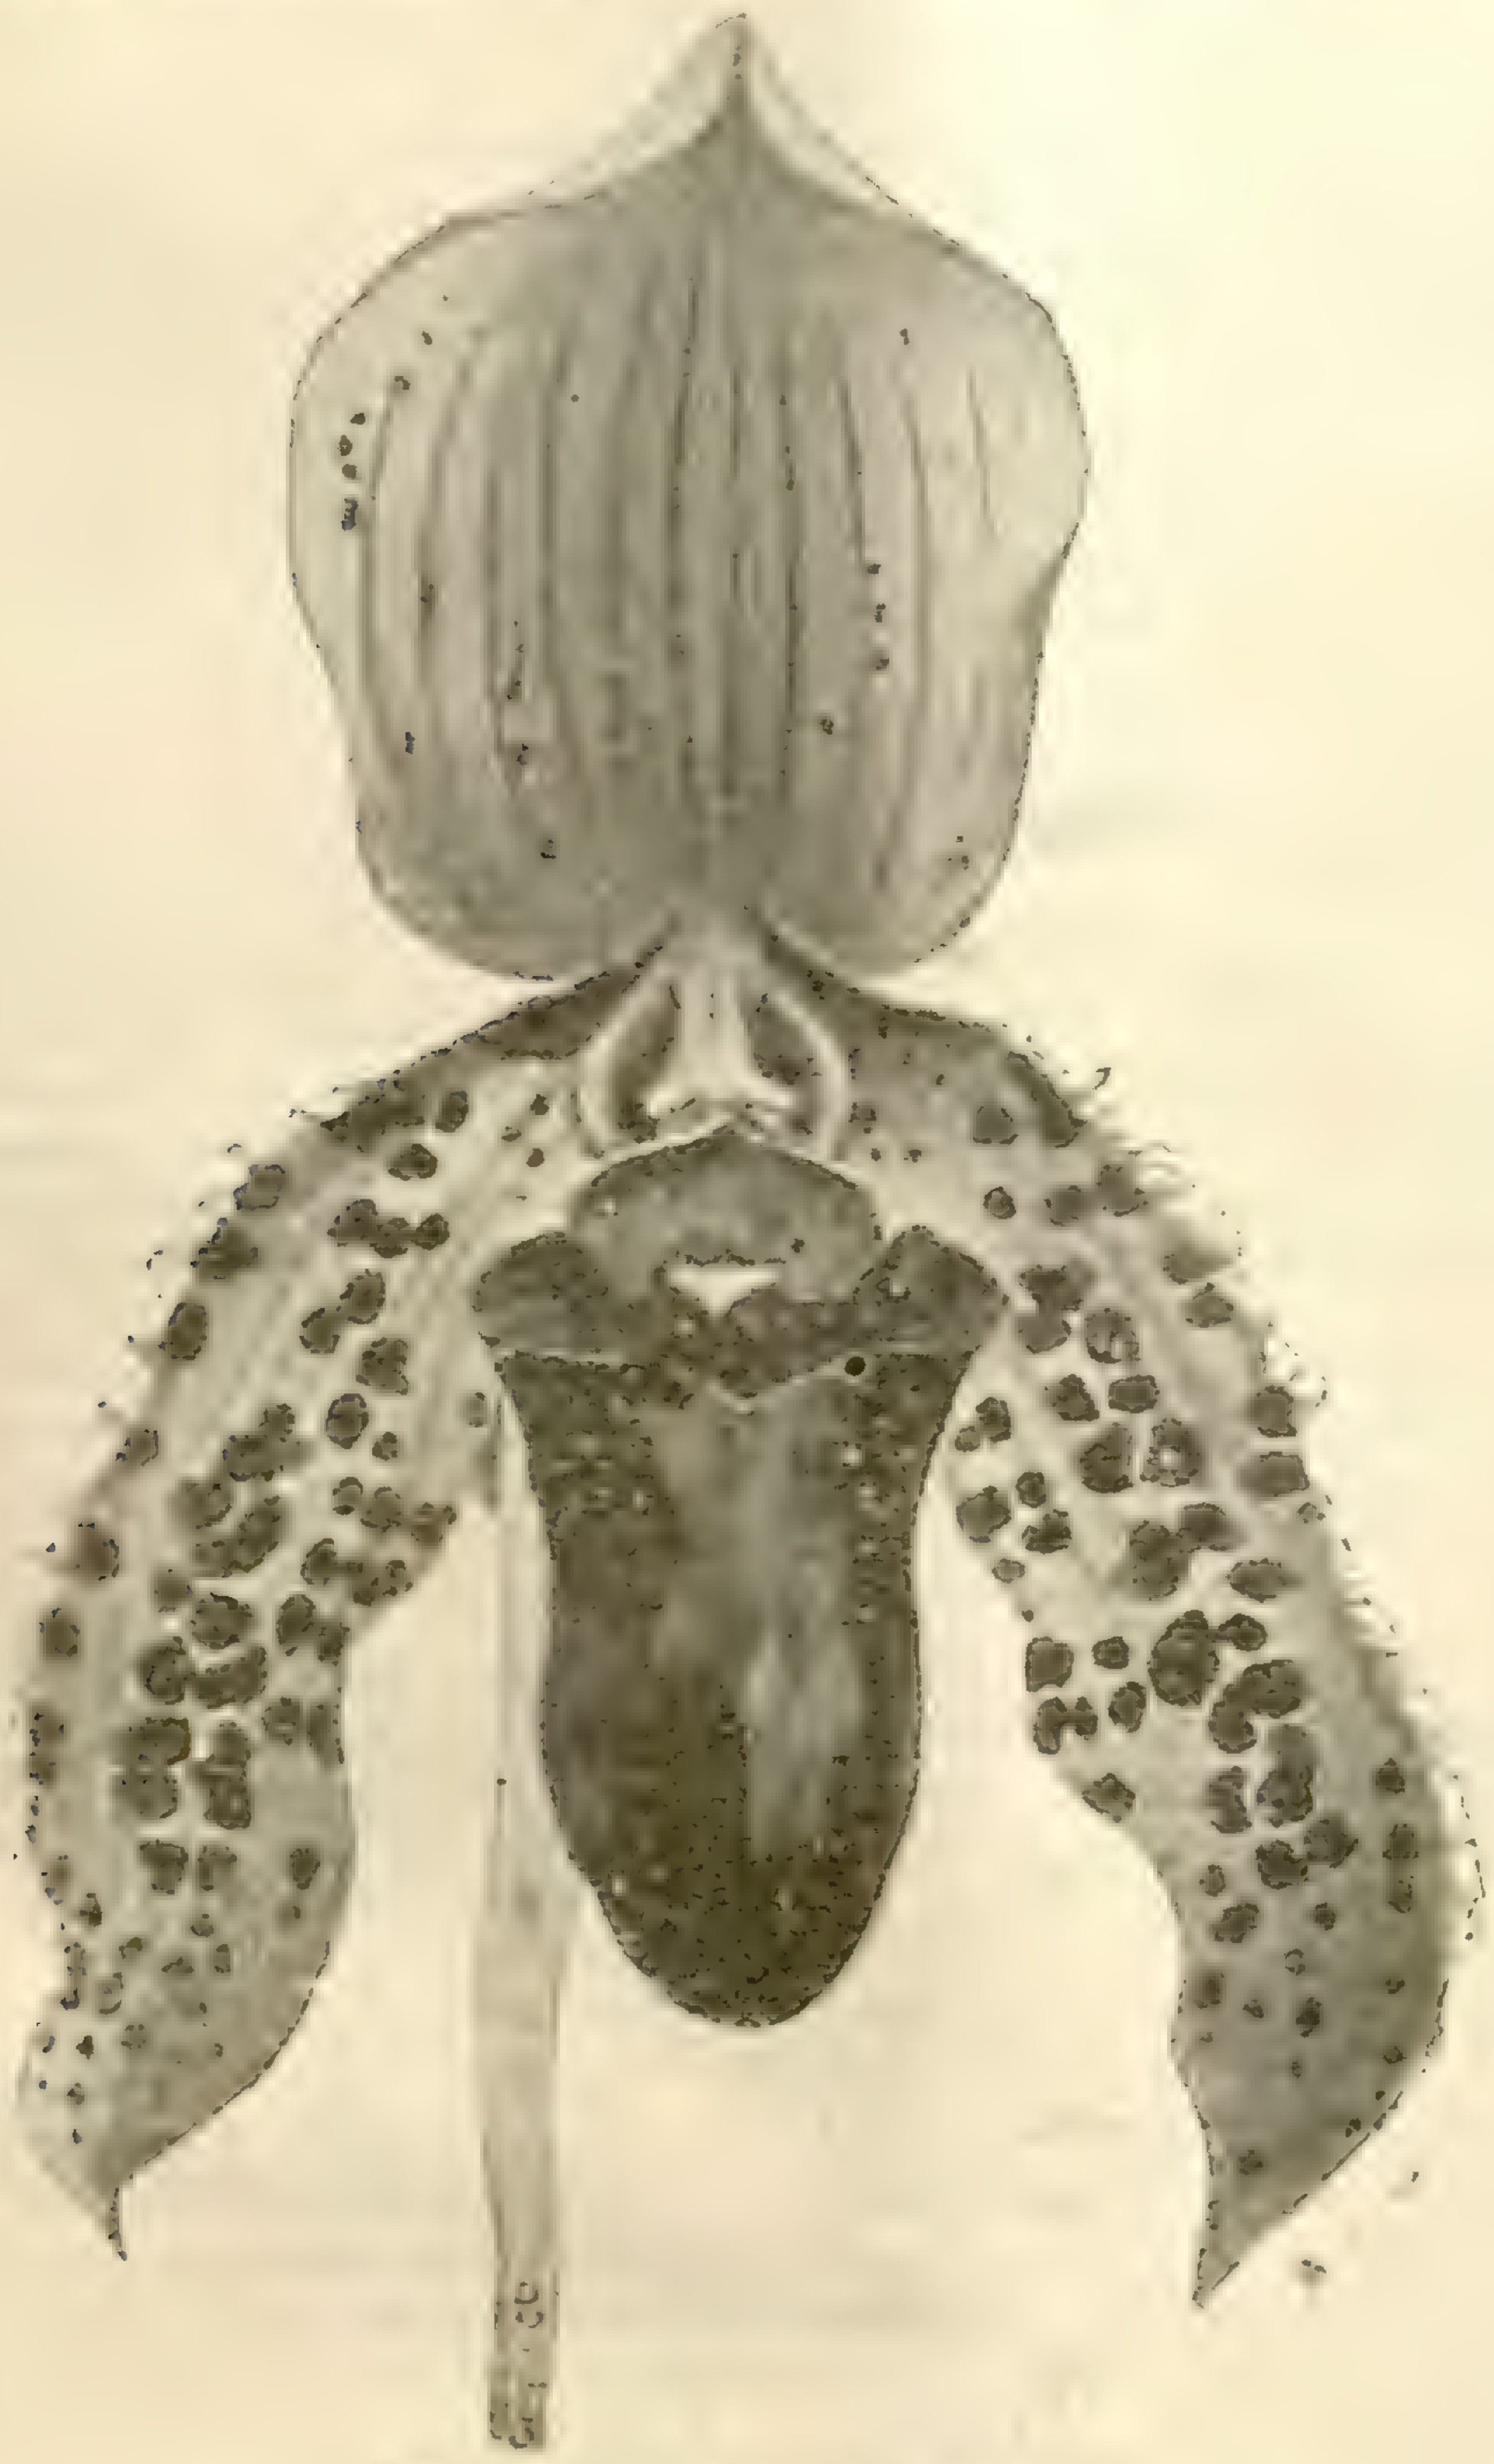
A BEAUTIFUL cypripedium, reminding one of a glorified and lightened C. callosum. The dorsal sepal has a white upper margin, is suffused with rich purple, and has a greenish base; over the whole are numerous dark purple veinings. The apices of the rosy petals are margined with white, while dark brown spots are strewn over the lower halves. The fine rich purple lip is veined with darker purple. This hybrid is the result of crossing C. callosum with C. bellatulum. A.M., R.H.S., November 8. Mr. H. J. Chapman, gardener to R. I. Measures, Esq., Cambridge Lodge, Camberwell.

CATTLEYA BOWRINGIANA LADY WIGAN.

A distinct and charming variety of a well-known winter-flowering cattleya; it has fine large flowers and substantial segments of a pretty lilac shade. The lip is lilac tinged with rose, and having a broad, deep purple band down the centre and extending on to the side lobes, where it contrasts forcibly with the white throat. A.M., R.H.S., November 8. Mr. W. H. Young, orchid grower to Sir Frederick Wigan, Clare Lawn, East Sheen.

CYPRIPEDIUM ARGO-MORGANIÆ.

A new hybrid obtained by crossing C. Argus with C. Morganiæ at Burford Lodge. Both the parents are evident in the hybrid. The dorsal sepal is fairly large and broad; whitish, shaded with rose and with longitudinal green lines that are here and there interrupted by small dark purple dots. The petals are very bold, deflexed somewhat, and blunt ended; pale greenish-white ground colour, very heavily spotted with large claret-purple spots. The lip is dull rosy-purple with a paler base. A.M., R.H.S., November 22. Mr. W. H. White, orchid grower to Sir T. Lawrence, Bart., Dorking.



CYPRIPEDIUM ARGO-MORGANIÆ.

BEGONIA WINTER PERFECTION.

This is another of the race of hybrid begonias raised at Chelsea and valuable for their winter-flowering propensities. This variety has large semi-double flowers of a soft and pretty shade of light rose. The foliage is bold, and the plant is robust and free. A.M., R.H.S., November 8. Messrs. J. Veitch and Sons, Chelsea.

DRACÆNA THE SIRDAR.

A handsome compact habited dracæna, with broad foliage of a very dark green shade and bordered with bright scarlet and crimson. The newer leaves are very bright in colour, especially under artificial light. A.M., R.H.S., November 8. Messrs. J. Veitch and Sons, Chelsea.

POLYPODIUM GRANDI-NIGRESCENS.

This is the name given to a novel and bold fern that is stated to be a hybrid between P. nigrescens and P. vulgare grandiceps. The plant is mostly akin to P. nigrescens, and like it shows the teat-like protuberances where the sporangia are placed. The fronds are of a dark green hue, somewhat stiff, and very much divided and tasselled at the ends, the divisions being quite bunched in some instances. F.C.C., R.H.S., November 8. Messrs. J. Veitch and Sons, Chelsea.

NERINES.

Miss Jekyll.—The segments of the flowers are but slightly undulating in this variety; the flowers and trusses are of a large size, and of a clear rosy salmon shade.

Lady Clementine Mitford.—A beautiful nerine, having fine flowers of a pretty salmon tint, with the segments all charmingly undulated.

Mrs. Douglas.—This is a distinct form, having rather campanulate flowers with regular segments that are neither recurved nor waved; colour bright rosy cerise, shading to pink. A.M., R.H.S., November 8. Mr. Lane, gardener to H. J. Elwes, Esq., Andoversford, Gloucester.

CALANTHE LABROSIOR.

A beautiful calanthe, bearing a fine spike of large flowers that are of the very faintest tinge of rosy-blush, with a pale yellow shade over the disk; the flowers measure two and a-half by three inches and are almost pure white. The variety was raised at Burford, but the parentage is not known. A.M., R.H.S., November 22. Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Dorking.

CIRRHOPETALUM APPENDICULATUM.

A quaint little orchid with long combined lateral sepals, creamy with red spots; petal small, yellowish green, with violet purple lines and fringes; lip small, violet purple. B.C., R.H.S., November 22. Mr. W. H. White.

DENDROBIUM FORMOSUM-LOWI.

An interesting and handsome hybrid obtained by crossing D. Lowi with D. formosum. The habit is intermediate, but the flower is much like that of D. formosum, save that the lip is flatter and has a deep orange shade over the whole of the disk and along the raised lines. Sepals and petals white. A.M., R.H.S., November 22. Mr. W. H. White, orchid grower to Sir Trevor Lawrence, Bart., Dorking.

CHRYSANTHEMUMS.

Lord Cromer.—A fine, bold Japanese variety, with broad, substantial florets that are brilliant crimson in colour, with a light golden reverse; the central florets incurve, and show the reverse side. An English-raised seedling. A.M., R.H.S., November 8. Mr. R. Owen, Maidenhead.

Mrs. W. Mease.—Now well known as the handsome primrose-coloured sport from Madame Carnot. A.M., R.H.S., November 8. Mr. R. Owen.

Jane Molyneux.—A handsome pure white Japanese variety, with long, drooping florets. A.M., R.H.S., November 8. Mr. N. Molyneux, gardener to J. C. Garnier, Esq., Rookesbury Park, Farnham.

President Bevan.—An immense Japanese incurved variety that appears to be somewhat variable in colour, from a flesh or salmon-pink to pale rosy-bronze. A.M., R.H.S., November 8. Mr. W. Wells, Earlswood; and Mr. W. J. Godfrey, Exmouth.

Nellie Pockett.—A finely shaped Japanese variety, massive and full; the florets, which are very numerous, are creamy white. A.M., R.H.S., November 8. Mr. W. Wells.

Chatsworth.—A large and deep Japanese chrysanthemum, with creamy white centre and rose-shaded outer florets; florets broad and incurving. A.M., R.H.S., November 22. Mr. W. J. Godfrey, Exmouth; Mr. W. Wells, Earlswood; and Messrs. H. Cannell and Sons, Swanley.

Golden Shower.—A handsome and curious decorative chrysanthemum, the florets being modified into long drooping threads like silk. The colour is rich gold, with crimson scarlet shading on some of the florets. A.M., R.H.S., November 22. Mr. Witty, Nunhead Cemetery.

Mrs. Barclay, a most distinct chrysanthemum with very broad florets that reflex slightly. It is a huge, massive flower, and of a very bright and rich rosy mauve colour. A fine exhibition Japanese form. A.M., R.H.S., November 22. Mr. H. Weeks, Thrumpton Hall, Derby.

Earlswood Beauty, a charming single chrysanthemum, with large and pretty flowers of a pleasing creamy shade. A.M., R.H.S., November 22. Mr. W. Wells, Earlswood.

Daisy Brett, a sport from the above, and differing from it only in being pure white instead of creamy. A.M., R.H.S., November 22. Mr. W. Wells, Earlswood.

Beauty of Scholing, a good decorative variety with broad flowers, in which the colours, scarlet and gold, are freely intermixed in shadings and streaks. A.M., R.H.S., November 22. Mr. W. Wells, Earlswood.

EPIPHYLLUM TRUNCATUM PRINCESS.

Certainly we have nothing so delicately beautiful among epiphyllums as this charming new variety. It is a free-flowering form, judging from the two small plants shown at the Drill Hall, and its flowers are of exquisite beauty, being of a transparent, soft, and very light shade of rosy blush. It is very distinct, and should help to revive the culture of epiphyllums. F.C.C., R.H.S., November 22. Mr. W. Bull, King's Road, Chelsea.

APPLE BALLINORA.

A fine late apple that probably has to own Blenheim Pippin as one parent. It has much of the shape of that variety, and is a good deal like it in flavour, but a little more mealy. The skin is wholly of a bright crimson scarlet, save for a yellowish base that is almost covered with russet; the eye is large and open, as in the Blenheim Pippin. A.M., R.H.S., November 22. Messrs. Hartland and Son, Cork.

CHRYSANTHEMUM RUST.

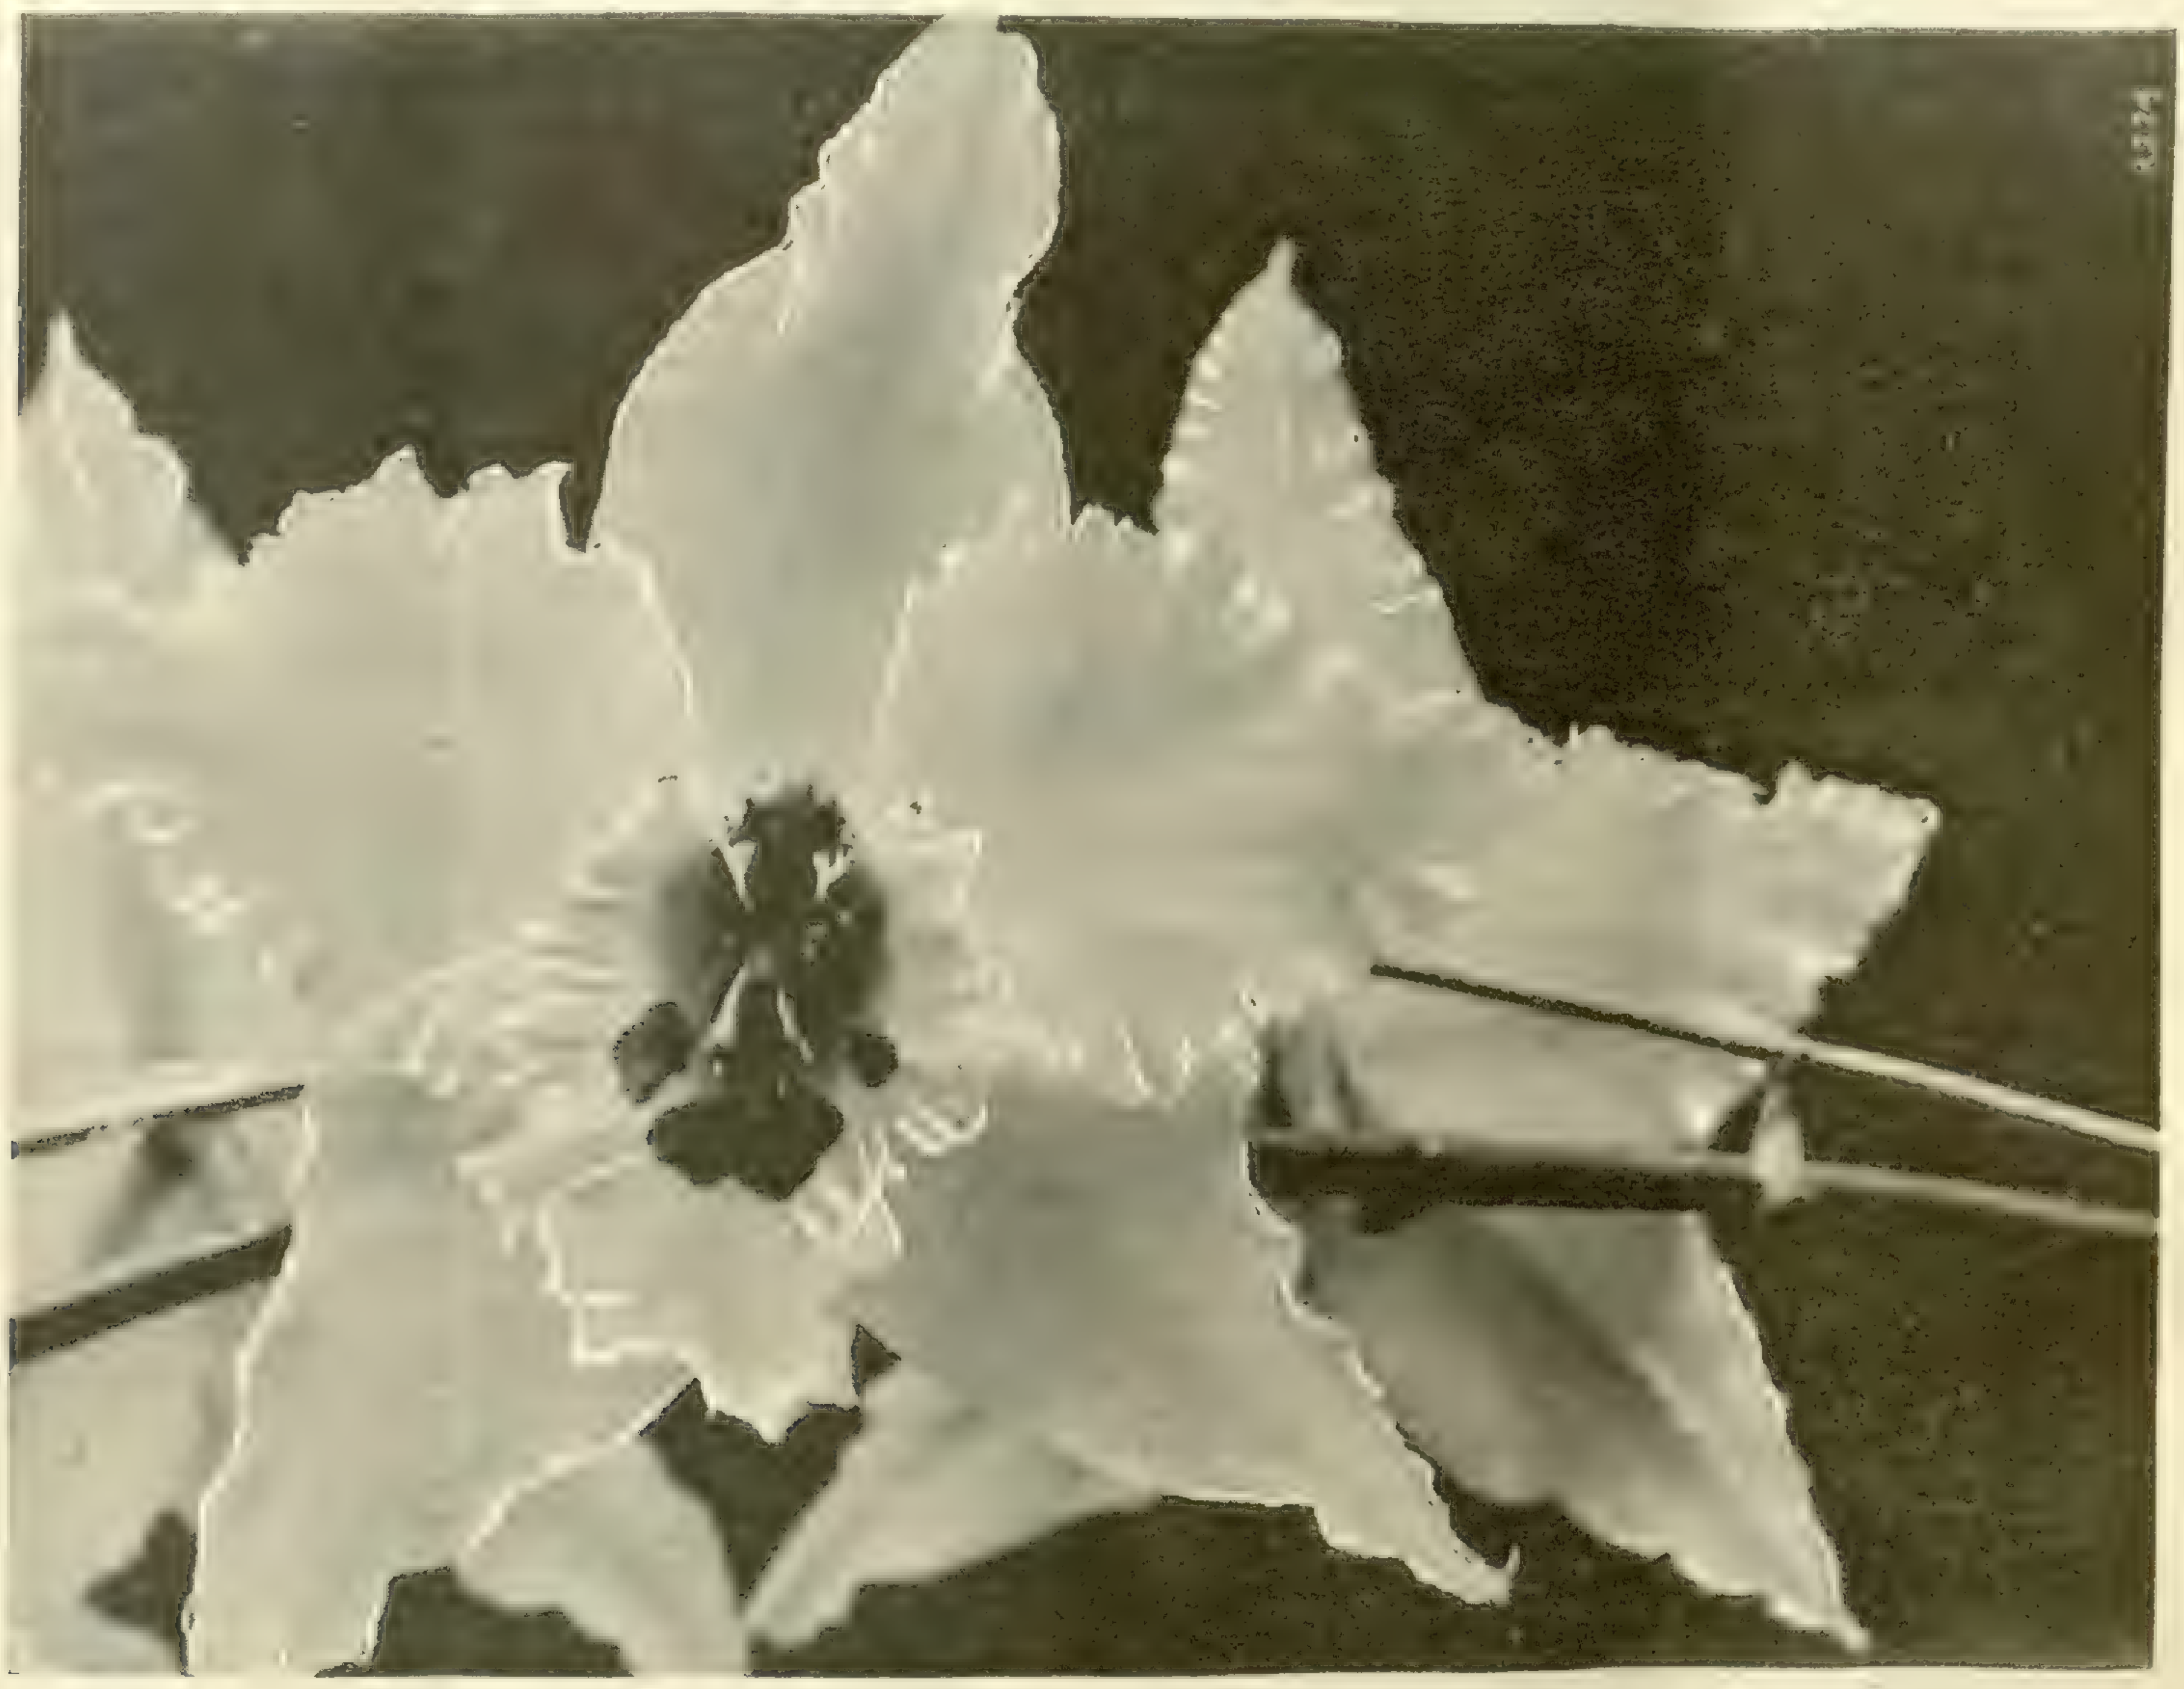
THERE have been of late quite a series of discussions respecting the "rust" on chrysanthemums. My opinion is that if taken in time it can be eradicated. Early last March, when our plants had been potted into three and a-half inch pots, I noticed on the under sides of the leaves small black specks, the worst attacked being Pride of Madford, Simplicity, Lady Byron, Eva Knowles, C. H. Curtis, and Lady Hanham. The other plants, about three hundred and eighty, were quite free, but these came from the south. I at once took these away from the collection and placed them in a cold frame by themselves, dipping each in a solution of sulphide of potassium, half an ounce dissolved in a gallon of water, as recommended by the GARDENERS' MAGAZINE. I continued it twice a day for a week, adding to it one tablespoonful of petroleum, and keeping it thoroughly mixed with the hand syringe while using. At the week end there was not a sign of the fungus left; and all these varieties have developed exhibition blooms of good colour. When the whole collection was "housed," the first week in October, the plants were syringed individually with a decoction of sulphur, quicklime, and paraffin, and up to the present date not a bit of mildew or fungus is to be seen.

Totley Hall Gardens. T. W. BIRKINSHAW.

Wintry Weather.—Early in the past week there was a material change in climatic conditions, and so great a drop in the temperature as to remind us that winter is rapidly approaching. The keen north-easterly wind that prevailed on Tuesday was followed on Wednesday by heavy falls of snow in the more northern parts of Great Britain, throughout Scotland, the North of England, Wales, and in some parts of the Midlands. In Lancashire there was a veritable blizzard. In many parts of the country the fall of snow was so heavy as to block railway lines, render roads impassable, and put a stop to outdoor work, and it is feared that in some districts the farmers will suffer from loss of sheep. From present appearances it is probable that we may now have a short period of cold weather.

ODONTOGLOSSUM CRISPUM PRINCE OF WALES.

POSSIBLY no odontoglossum exhibited in this country during the present year has been so much admired or widely commented upon as the beautiful variety introduced by Messrs. H. Low and Co., Bush Hill Park Enfield. No doubt it is the premier form of O. crispum seen during 1898, for not only is it of great beauty, but it is finely formed. Its beauty consists almost entirely in its purity, for sepals and petals are of the purest whiteness, save for the very faintest tint of blush on a segment in one or two of the dozen flowers the fine spike carried. The extra large lip is white, with the usual golden disk, with three or four rich red-brown spots just where the disk begins. The flowers are four and a-quarter inches broad across the petals, thus comparing most favourably with the distinct and handsomely spotted O. crispum apiatum belonging to Baron Schroeder. The accompanying illustration is a reproduction from a life-sized photograph of O. crispum Prince of Wales, taken at Enfield by Mr. I'Anson. The merit of this grand orchid can be to some extent gauged by the fact that when it was exhibited in June last Messrs. Hugh Low and Co. were awarded a first-class certificate by the Royal Horticultural Society, and, in addition, a silver Banksian medal.



ODONTOGLOSSUM CRISPUM PRINCE OF WALES.

PLANTING HARDY FRUITS.

PLANTING has been somewhat delayed this season by the extremely late defoliation of most trees, but especially apples, in many districts. By the third week of November in some years I have had thousands of young trees placed in their permanent quarters, or transplanted for nursery purposes, yet now I have numbers that are nearly as green as they were two months ago, and have scarcely lost a leaf. It may be that when the foliage has so nearly completed its work little injury results even if the trees are lifted before it is all fallen, but that a considerable evaporation does take place under certain conditions is readily proved. The safety or injury resulting from moving fruit trees while still in leaf depends, therefore, to a great extent upon the weather prevailing at the time or immediately following the operation. With bright, sunny, warm days, such as we have had lately, there is a risk of giving a further check than would result from the mere transplanting alone, and for this reason I generally defer the autumn planting until the leaves are all down. The most important point of all is, however, to have the soil in the right condition, and especially if it be of a heavy, adhesive nature. In my experience I have found that this outweighs all other considerations in fruit-tree planting; the utmost care in other respects is of little avail if the soil be wet and cloggy, as it is either forced round the roots in impenetrable masses, or it leaves gaps that are almost as bad. It is better rather dry, so that it can be worked freely, and, given a vigorous tree that has been carefully lifted, it is surprising what recuperative powers it will display in the first season.

In ordinary garden planting the arrangement of the fruit trees is a comparatively simple matter, because it is seldom that a quarter is specially set apart for them, as the majority, besides those trained to walls, are planted near the walks, where they will not too heavily shade the adjoining vegetable ground. When a regular or more extensive plantation is to be formed, the method of arrangement and distances require the most careful consideration, because it is necessary to look to future results. Experience shows that it is easy to err in the direction of planting too thickly, and, if thinning is not duly provided for, in a few years an otherwise very valuable plantation will be greatly reduced in productiveness. Many instances come under my observation that illustrate such evils, but two will suffice to show what is meant. In one, the plantation of apples, plums, and pears has been formed about twelve years, and it should now be in full bearing, and as a matter of fact a large quantity of fruit is produced; but an inspection of the crowded thickets proves not only that the crops are scarcely more than half of what they should be, but the trees are being rapidly ruined. Thinning now would be a difficult matter, as the trees are so drawn up that many would need staking to ensure their safety in storms, for hitherto they have been self-supporting, as it were. Close planting is adopted to obtain as large returns as possible from a limited area of highly rented land, and when the time for thinning comes few growers have the courage to do what is so needful for after good results.

The other example is quite a young plantation of dwarf apples with bush fruits between, and there the progress and returns have been highly satisfactory up to the present. At the same rate of advance, however, in three or four years' time half the trees and bushes will have to be removed to give the others a chance to thrive and bear. In this case the apples are planted at seven feet apart each way, with gooseberries or currants at the half distances between the rows and in the rows. For small-growing varieties, like Stirling Castle or Seaton House, the distance named will suffice for some years; but for free growers, like Bramley's Seedling, Lord Grosvenor, or Cox's Orange Pippin, double the distance would be much more satisfactory if a permanent plantation is to be formed. The only way in which such a plantation can be thinned is by removing alternate trees in each row, thus leaving it in the triangular form instead of the square, but while this doubles the distance between the trees in the rows it only slightly increases the distance between the trees in adjoining rows. The same objection applies if the trees are planted in the triangular or alternate system, because the thinning would then take the form of removing alternate intermediate rows, thus leaving the trees in the quadrangular system, but with double distances between the rows, while that between the trees in the rows would remain unaltered.

A system I have adopted with satisfactory results is to form mixed plantations of large and small-growing apples in the following way: The strong growers are planted as bush apples on a Paradise stock at fourteen feet apart each way (quadrangular), then at half distances between these Stirling Castle, or a similar grower; while again between these gooseberries and currants are planted, and though the latter have not much space yet they will stand for some years, and if the land is clean and fertile they give a good return before it is necessary to remove them. When these and the small-growing apples have to be sacrificed it will leave me permanent trees at fourteen feet apart each way, and the future of the plantation could be still further provided for by having standard apples alternately, *i.e.*, at twenty-eight feet apart, thus somewhat reducing the number of dwarf apples but ensuring a more lasting orchard.

FRUIT GROWER.

POT CARNATIONS.

THE carnation has now become such a general favourite that there are few places where an attempt is not made to grow a few in pots; in fact, some very desirable varieties would be lost to us were it not that we could give them the shelter of a house during the winter months, their constitutions not enabling them to withstand cold and damp with impunity. But merely putting a carnation in a pot does not mean its successful growth, for it requires a special soil for its roots, special atmospheric treatment, and exceptional care in watering to secure the best results. In smaller establishments the essential conditions to securing healthy, vigorous plants are not always obtainable, for in not a few places they have to be grown along with other greenhouse subjects. In cases of this kind the carnations will have to submit to general treatment, and it will only be an exceptional instance when they are found in a satisfactory state.

When a house can be devoted to their culture—and they are worth one—there is no reason why pot carnations should not be found as healthy as geraniums. The chief difficulty in carnation culture lies in the tenderness of the roots. These organs resent too much moisture, and are impatient of dryness. This teaches us that the compost used should be a porous one, and that strict attention and care in watering should be exercised. A porous loam—one that will not run together—is the one to endeavour to secure for carnation culture in general. Of course, to obtain the best results all round different blends will be necessary, for it will be found that the more spindly the natural habit of growth of any variety the more sandy should be the soil for its roots, and the more robust the growth the stronger should be the loam used. In all cases a natural is better than an artificial blending, and therefore an open sandy loam is the one to employ generally for wiry-growing carnations. For strong growing sorts, such as Malmaisons, a really porous loam is the staple to make use of. To this may be added leaf-mould and well-dried cow manure. In the event of the soil having a tendency to run together, soft red bricks broken fine, some powdered, may be incorporated with it. Should sand be necessary to get the blend of compost desired, use that which is sharp and clean. As is well known, thorough drainage is indispensable in the pot culture of carnations. Not only should the crocks be well placed, and in sufficient quantity, but they should be covered with some lasting material, such as dried moss, to prevent the soil mixing with them. Some like their balls of soil around the roots moist before they pot the layers up, and then they allow the newly-potted plants to stand a few days before water is given to them. Others, again, prefer the little balls just damp, and then they give a good watering immediately the operation is finished. In either case stand the pots on ashes or gravel in a cold frame for six weeks or two months, and then remove them to a light, cool, airy, dry structure for the remainder of the winter months. During these months the plants will not require much water, but they should be examined once a day at least, and their wants supplied.

The success or failure which follows is almost entirely in the hands of those who attend to the watering. To meet with success we must not water until it is necessary, and then fill the pot to the brim. This will drive out all the air among the particles of soil, and enable a fresh quantity to take its place when the water drains away. In the way of feeding, fish guano, bone meal, wood-ash, and nitrate of soda are all useful as helping and stimulating agents, but should be used sparingly. Weak solutions of farmyard liquid manure may also be given occasionally, and sour milk, though it has a most unpleasant odour, will foster healthy growth in the carnation. If the loam employed be of a fertile character very little assistance from fertilizers will be necessary, and therefore in all cases only a limited quantity of any should be utilised. Worms are sometimes a little troublesome, but if none of the specially prepared antidotes are at hand a solution of mercuric chloride at the strength of one ounce to five gallons of water will shift them. In order to get the mercuric chloride to dissolve it will be necessary to first dissolve a little chloride of ammonia in warm water, and then add the mercuric chloride.

A damp, stagnant atmosphere in the house should be sedulously guarded against; in fact, a free circulation of air at all times when the temperature is above the freezing point, with a gentle warmth in the pipes in rather cold, foggy weather, will be most conducive to healthy, sturdy growth in the carnations. Over or under watering and faulty ventilating will almost invariably lead to an attack of fungus, which will take time, patience, and perseverance to get quit of.

The finest houses of pot carnations I have yet seen are at Eaton Hall Gardens. The tree forms are grand, but the Malmaisons are superb. Mr. Barnes, the Duke of Westminster's head gardener, is in this, as in every subject committed to his charge, thoroughly familiar with the essential items to successful cultivation, and the keen practical energy with which these are carried out leaves nothing to be desired. The trees and Malmaisons are in separate houses, both of which are span-roofed, with paths in the centre and beds on each side. The plants standing on these beds were close to the glass, and in the current of air passing through the house—between the bottom and top ventilators. The soil in which Malmaison carnations were growing was, I noted, of a very porous loamy character, like little lumps, to which had been added leaf-mould and crushed bricks. The majority of the plants were in seven-inch and eight-inch pots, and were a mass of strong, healthy growths, foliaged right down to the soil. Not a speck of disease or anything else was visible on the, comparatively speaking, broad, thick leaves. Every plant was a specimen, and when the time comes for them to yield their quota of flowers the display, judging by the exceptional stoutness of growth and short internodes, will be well worth a long journey to see. Such exceptional examples of successful pot cultivation of carnations are so rare that I feel constrained to advise anyone interested in them to endeavour to secure the privilege of a peep at those at Eaton Gardens. Ocular demonstration is positive proof of facts, and a few wrinkles can nearly always thus be obtained.

J. RIDDELL.

DISAS.

THERE are a large number of these beautiful cool house orchids described, but only about half-a-dozen are worthy of extended cultivation. The species are natives of South Africa, and chiefly found growing at high elevations. Most disas are of exceptional beauty, and quite distinct in floral character from other garden orchids, while, if well managed, they make a fine display when in bloom. They are herbaceous, for when the leafy annual stems have finished their growth and flowered they die down, and young growths take their place. Growth is made during our winter and spring, and flowers are produced in early summer, these remaining in condition for six or seven weeks. When they have done blooming the plants will require a short rest, and during the resting period they want little water beyond a spraying once a day. At all times, however, they need plenty of air, day and night; even in winter a little should be allowed when the weather is at all favourable. We always remove our plants from the house at the latter end of May, and put them in a cold frame with a north exposure until the first week in the present month, shading them with a roller blind whenever the sun is very hot. During the time they are in the cold frame watering must be done with great care, and according to individual requirements.

The present is a good time to commence repotting the disas, as I find October the best month, because as yet the new roots are not matted together. All pots and crocks should be clean, for the roots of the disa love cleanliness. The compost should consist of three parts peat of a rough nature, a small portion of turfy loam pulled with the hand into small pieces, some chopped sphagnum, and pieces of soft sandstone, mixing these ingredients together. Crocking the pots or pans should be done with care, and the crocks are best arranged in the pots on their edge, instead of flat side down, as it is much better for the water to pass away quickly from the tuber; and not only that, but the fleshy roots delight to ramble in the moist drainage. Give the crocks a covering of sphagnum moss, to keep the soil from choking the drainage. The plants should be slightly elevated above the pot rim; then, with a thin label, work the soil down the side, but not so as to make it too firm, or the roots will not spread; finish off with a little sphagnum moss. After potting remove the disas back to their winter quarters, which should be a very light, airy house; stand the pots or pans on stone slabs covered over with sand and spar to hold moisture both day and night. This latter is very important; so also is it to have these orchids near the front ventilators. Insects which are troublesome to disas are green and black fly, thrip, and red spider, but these pests can soon be eradicated by the use of XL All vaporiser. Slugs are very fond of them, and also the little shell snail; these can be trapped with lettuce leaves. Syringe the plants twice a day when the weather is favourable, but little water will be required at the roots until the early months of the year, when, from February to May, they will take copious supplies. During the latter month a little weak guano water given once a week will prove very beneficial.

Disa grandiflora produces the largest flower of any member of the genus, and varying in colour from brilliant carmine-red to a deep blood-red; the sepals in some varieties are orange tinted. There are several hybrids, such as D. Langleyensis, the result of crossing D. racemosa with D. tripetaloides; also the beautiful D. Veitchi, a hybrid between D. grandiflora and D. racemosa, the sepals in this being of a bright carmine, with the inner portion of the lip almost white, spotted with crimson. D. Kewensis, D. Premier, and D. Clio (the latest) are all additions of great value. Disa grandiflora ripens abundance of seed, and this should be sown as soon as it is ripe, for it does not improve with keeping. My method is to obtain a round seed pan, putting in the bottom some crocks, then place in some pieces of peat and lumps of sandstone, giving the whole a thorough watering with boiling water. When cold, sow the disa seed on the soil, just sprinkle a little silver sand on it, cover over with a bell-glass and keep it in a temperature of 50 to 55 degrees, shading it from the sun at all times. The seed will soon germinate, then gradually harden the seedlings, so that they can be placed in a cooler house. The temperature I find to suit the disas best is from 40 to 45 degrees at night, with as slight a rise as possible during the day.

Totley Hall Gardens. T. W. BIRKINSHAW.

Notes from Natal.—A correspondent at Helpmakaar, Natal, writes as follows: "Since I have been here I have heard of a red and also of a pink arum lily." He inquires, do we know of such varieties? Yes, certainly. Then he proceeds: "The place where I am to see them is about a hundred miles from here, but if novelties I will go and see them. They are said to be about half the height of an ordinary white arum, and should live in the South of England. Would it be worth my while to get what bulbs I can, which would involve another journey? I know the white arum lilies are, of course, no good; but would it pay me if I could get a quantity of yellow ones as well? I am told of a place in Zululand where they are to be found, and I intend making the journey. I should like to know of any South African plants which would be of use, as I do not know when I shall go next, or what I may come across. The flowers of the veld are not yet in bloom (October 20), as it is too dry, with the exception of a very pretty miniature iris—mauve, with a yellow spot on each segment, of which I have seen several specimens. England is not the only place that has been suffering from drought, for the veld, as I have said, is as brown as a berry, and our sheep and cattle are dying of starvation. It is impossible to plough, and when we shall have green vegetables again I do not know. Yesterday we had the first rain of the season. It was just enough to start the grass, but not enough to plough. The heat is dreadful, the only time of day which is tolerable being from five to half-past seven a.m. I live five thousand feet above the sea, at the end of a chain of mountains called the Biggarsberg, and, standing at my open bedroom door, can see right into the Transvaal and Zululand. I send this letter by a Kafir to the nearest post office, twelve miles distant, whence another Kafir will take it twenty miles or more to the railway station, and I have to send that Kafir to the same place now and again to see if there are letters for me, for there is no postal delivery here. On our (Boer) farm we lay in a stock of groceries for three years at a time!"—WM. NORMAN BROWN.

WORK FOR THE WEEK

COOL ORCHIDS.

PLEIONES, or Indian crocuses, as the deciduous cœlogynes are sometimes called, are charming little orchids for supplying flowers at this dull season of the year; they not only make valuable decorative plants, but are most useful for supplying cut flowers, and for the latter purpose, when gathering them, it is best to give the blooms a gentle tug, when they will readily part from the young growth, and by so doing you have a much longer stem than by cutting. The following—P. lagenaria, P. Wallichiana, P. Reichenbachiana, P. humilis, P. Hookeriana, P. maculata and its pretty but rare variety alba—should be grown by every amateur, as they are easily managed, and few orchids repay us better for the little trouble they give. Being deciduous orchids, they are often thought to require a good rest after flowering, but this is a mistake, as they are never really inactive, for by the time the flowers have faded the green young shoots from which the flowers sprang will have commenced to push out from their base a number of small white roots, telling plainly that this is the time to repot. Under proper treatment these small growths will make strong flowering pseudo-bulbs. It is not absolutely necessary to repot these plants every year, unless the soil has become sour, once in two years will suffice, and result in the production of plenty of flowers. When repotting, shallow pots or pans may be used, but for those who prefer to grow their plants suspended from the roof pans are the most convenient, but in either case it is necessary to afford abundant drainage, so that the large quantities of water these plants require when in full growth may pass freely through the compost; over the crocks should be placed a thin layer of sphagnum moss to keep the drainage clear, and the compost used should consist of equal parts of peat, loam, and moss, with a good sprinkling of silver sand, mixing the whole together. The method of dividing the pseudo-bulbs, as is often practised, I do not recommend, preferring to pot them up in clumps with the bulbs almost touching each other, as by potting them in this manner the tender young roots are not so liable to injury as when pulled to pieces. After the plants have been turned out, all the exhausted soil removed, and old roots cut away, the pots or pans which are to receive them should be nearly filled to the rim with the compost, and on this the base of the clump should rest, then fill in with the compost, and press it firmly around the bulbs, also filling in between the bulbs with the roughest of the material, or some nice heads of living sphagnum moss. This business being completed, the plants should be placed on a shelf at the warmest end of the cool house, where they will have plenty of light, or better still, if convenient, give them a position in a house a few degrees warmer. Water must be sparingly given for some time, supplying only sufficient to keep the compost just moist; but when the plants are established and start to grow vigorously the amount of water must be gradually increased. P. Hookeriana and P. humilis, having now completed their growths, should only receive sufficient water to prevent the bulbs shrivelling; their flowering season being January and February, these two species are best grown in the cool house all the year round.

Our plants of Lælia præstans have been very gay for the past few weeks, some of the flowers having lasted four and five weeks in perfection. One half of our plants were grown in the intermediate house, and the other half in a house devoted to cool cypripediums, cœlogynes, lycastes, and various other cool orchids that like a temperature two or three degrees higher than that of the odontoglossum house. Flowers produced by these plants we find come darker in colour, open better, and last longer in perfection than those grown in the warmer house; therefore, in the future, accommodation will be found for the remainder of these plants in this house. By the end of this month the majority of them will have passed out of flower, and any that were not repotted in the spring and require new rooting material should be attended to in the same manner as advised in the spring calendar, as the young roots will now push forth from the base of this season's growth and soon enter the new material. As long as the plants continue to make roots keep the compost fairly moist, but when at rest only sufficient water will be needed to keep the pseudo bulbs plump The same remarks apply to Lælia pumila and Lælia Dayana.—E. SHILL, *New Hall Hey Gardens.*

CONSERVATORY AND GREENHOUSE.

THE last of the forcing roots—lilies of the valley and spiræas—together with Azalea mollis, lilac, and other things which are required annually for cutting and decoration, are to hand, and in potting each of these up it is necessary to use as small pots as possible; indeed, there is no gain in having large ones, as the plants do not require a mass of soil to root into so long as the roots are regularly supplied with moisture; and this applies to all plants that have been properly prepared for forcing. The balls should not be reduced, but they may be forced into small pots, using fine soil, such as leaf mould and sand, for working in between the roots. It is useless attempting to force plants which have not been properly prepared and are not furnished with a mass of roots, and in no case is this so forcibly shown as with roses. Where roses are intended to produce bloom by Christmas the desired number of the most promising ones should be selected and placed in gentle heat at once, gradually increasing the temperature as growth develops. Mildew is the worst enemy one has to contend against in forcing roses, therefore this must not be allowed to obtain a foothold. The plants should be sprayed frequently with a mixture of soft soap and sulphur, especially on the under side of the leaves. It should be remembered that a low, sluggish atmosphere in the house is productive in setting up mildew, therefore both the heating and ventilating require careful consideration during dull, sunless days, and discretion used in syringing and damping down. Plants that are thoroughly established in their pots, and which have been forced previously, are the most amenable to the treatment, and may be selected for giving the first display. The pots being crowded with roots and the drainage perfect, weak soot water or liquid manure may be given in a tepid state once or twice a week. Arrange the plants near the glass, that they may have all the light possible, and do not crowd them with other things. Roses as cut flowers being the desideratum during the winter months, early fruit houses may be utilised, as the plants, being arranged beneath vines or peach trees, will take no harm for a time, and valuable gatherings of choice buds may be obtained by this means.

We have devoted one long span-roof pit this autumn to mignonette and zonal pelargoniums, the same treatment, viz., a cool temperature, plenty of air, and a slight warmth in the pipes occasionally to expel damp, suiting them admirably. They are now dwarf in habit and full of bloom, and promise to yield a good supply for many weeks to come. Weak soot water is the stimulant used, and they appear to revel in it. In writing this calendar I have referred to poinsettias being treated as greenhouse plants, and advised growing them as such, but a slightly warmer atmosphere is necessary now to encourage the bracts to develop to their largest size. Much of the beauty of these plants is lost, even when fine heads are produced, if they are not furnished with healthy leaves down to the pots. This is best secured by growing them in cool but sunny quarters, where they become short jointed, and the leaves have remarkable firmness of texture. Poinsettias are undoubtedly one of our very best winter plants, and well repay for extra trouble bestowed upon them. Potting for the time being will not command much attention, but provision should be made for a more busy season by providing a good store of different composts suitable for various requirements. By bringing fresh cut turf, peat, leaf mould, sand, &c., under cover now it will be in readiness for use next spring, when very often the outside store is either frozen or in a cold, saturated state.—R. PARKER, *Goodwood Gardens.*

KITCHEN GARDEN.

THE favourable weather of the last few weeks has enabled outdoor operations to be carried on uninterruptedly. The soil is in good condition at the present time for digging, and therefore such work should be pressed forward as quickly as possible, so that all may be done before severe frost sets in. At the present time falling leaves are a great trouble, and should be cleared up as soon as they fall, for when allowed to lie among the plants they soon cause them to damp off; this is particularly the case with seedlings, such as lettuce, cauliflower, parsley, cabbage, &c., as these being tender and full of moisture are not able to submit to being partially covered. The more such plants are exposed at this time of the year the better will they be able to endure the frost later on. Those who have not made preparations for protection should lose no time in doing so, for though we have had an exceptionally mild season so far it is always best to be well prepared in case of a sudden change. Cabbages have made marvellous progress this autumn, and should the open weather continue for a time it is doubtful if they will withstand the winter should the frost be severe. In case such might be the case it would be as well to prick out those still remaining in the seed beds to fill up any blanks that may occur. During dull, foggy weather French beans in bloom must have a little extra heat given them, so that the ventilators may be opened a little wider to expel the damp, for unless the flowers are kept dry there will be but few beans set. Where room can be afforded, another sowing may now be made, for during the short days growth is very slow, therefore a much longer time is needed to have the crop ready to gather. Asparagus is often in demand at Christmas, and if preparations are made now by making a hotbed of leaves and stable manure there will be ample time for growth to be made without unduly forcing. The most tender heads are those grown where there is a free circulation of air, and for this reason it will be far better to plant a few days earlier, so as to allow plenty of time, than to try to hurry growth by applying too much heat. It will be as well to cover those beds intended for forcing with rough litter, in case bad weather should set in to prevent them from being lifted when required Globe artichokes suffer much in some places during winter where the soil is heavy. It is, therefore, a good plan to have the ground covered with a few inches of leaves to exclude the frost, and now that there are plenty falling these could be placed in position at once, which would save any further trouble. Seakale should now be taken up and laid in under a north wall, where it could have a little litter put over it in case of severe weather. When cleared off the ground in this manner it allows of digging being done, which is a great help in many places, for when taken up as required digging cannot be done till late in the season.—H. C. PRINSEP, *Buxted Park Gardens.*

FRUITS UNDER GLASS.

POT strawberries should now be placed in their winter quarters, and if it is thought desirable that they should be wintered in frames under glass a good light position should be chosen for the frames, giving free ventilation both night and day, and covering the lights with mats only during the sharpest frosts. The pots should be plunged to the rims in ashes. My own practice is to winter the plants entirely out of doors, plunging the pots in ashes in an open position as above advised, and leaving them exposed to any weather which comes, and I have never found any ill effects arising from such exposure, though many times the plants have gone through long, lasting frosts, with the temperature falling well below zero nightly. Unless the plunging material is brought quite up to the rims of the pots there will in severe frosts be some loss of pots, but this is readily guarded against, as the ashes give all the necessary protection wanted by well-baked pots. Growth has this season been carried on much later than usual, with the result that the plants now show no signs of being grown from runners obtained from plants affected by the great drought, so that matters have righted themselves, and the crowns are plump and good.

Where the early vinery has an outside border this should have a good deep covering of dry leaves, of which there will now be plenty, and if the vines are planted outside and led through holes in the front wall the exposed portions of the stems should be well protected by haybands, or some other such protective material, as great injury is often done to growing vines by having the flow of sap arrested owing to the stems being frozen through. I am no advocate for the old-fashioned method of making up hotbeds on the early vine borders, but a deep covering of nice dry leaves is quite another matter, as it keeps the roots nicely cosy without overforcing them. The early house may now be closed and started at any time, giving it the same routine treatment as that advised a few weeks back for pot vines. Bear in mind that it will take the earliest cropping vines, such as Sweetwater and Hamburgh, at least five months from the time of starting, to perfect their crop, and if they are moved along still more slowly than this it will be all the better for the fruits, as when pushed too fast, the growths are spindly and the bunches run to tendrils. Syringing and damping down should not be indulged in too often; a damp atmosphere, though opposed to the progress of insect life, is not really good for the vines and is frequently overdone, causing a flabbiness of the foliage. Make sure that the inside border is in fairly moist condition before starting the house, and if it be found at all dry give just sufficient tepid water to alter this, leaving the first heavy watering to be done a few weeks hence when growth is really active. Push on with all work in the way of renovating or entirely remaking the borders of later houses from which the crop has been cut, as the earlier such work is finished the better it will be for next year's crop. A small but important matter in carrying out such work is to keep the exposed roots carefully covered with mats, which should occasionally be damped during the period which must intervene between lifting and relaying the roots. Roots of vines which are given to shanking will mostly be found to have soft and thickened ends resembling the air roots which such vines almost invariably show during the growing period. These thickened ends should be cut off at a point where the roots assume the normal form.

The tiny fruits of such precocious figs as St. John's and Tingo de Mel are beginning to show prominently on pot plants, and no hesitation need longer be felt as to commencing forcing operations with such excellent varieties as these, which are not at all addicted to casting their fruits. With me figs and early grapes have to share the same house, but the former are not grown under the latter; each has a portion entirely devoted to it, and the figs do really well under the same treatment as the vines, but were I in a position to divide the two I should allow the figs a little more heat during the day than I give to the vines.—J. C. TALLACK, *Livermere Park Gardens.*

FRUITS FOR COTTAGERS AND SMALL FARMERS.

R.H.S. VARIETIES OF FRUITS.

IT has been my privilege in past years, when lecturing on fruit culture in connection with technical instruction classes, to recommend and distribute the leaflet of the R. H. S. entitled in 1892 "Fruits for Cottagers and Small Farmers." The excellence of even the first edition, prepared under the supervision of the Fruit Committee, which (we are told in the first page) "consists of forty of the leading experts in fruit culture in this country," is, of course, beyond all question. Sixty thousand copies of this edition appear to have been circulated. In October, 1892, a second edition was issued, and now a similar leaflet, entitled "Varieties of Fruits," is offered for circulation. This last leaflet is, in fact, an enlarged and revised edition of the first. It contains details on artificial manuring not in the former edition, details which are of great value.

But I am writing chiefly to direct attention to the lists of apples recommended at intervals by the R. H. S. In the first and second editions twelve varieties are selected for cooking, eight for eating. In the edition recently published, fourteen varieties are named as apples for cooking, from trees suitable for gardens as bushes or as half-standards, ten cooking varieties as suitable for standards and orchard trees, eleven eating varieties, suitable for gardens as bushes or half-standards, and seven as suitable for standards and orchard trees, forty-two varieties in all. A few of the varieties, however, occur in both lists.

The poor cottager or small farmer, one would suppose, will be sorely puzzled in making a choice of his two or three trees; as he also would be over the word "pendulous," used to describe the habit of various trees.

The following table of the varieties recommended may be interesting (Editions I. and II.)—

APPLES FOR COOKING.

Blenheim Orange
Bramley's Seedling
Ecklinville
Keswick Codlin
Lane's Prince Albert
Lord Suffield
Lord Grosvenor
New Northern Greening
New Hawthornden
Pott's Seedling
Stirling Castle
Warner's King

APPLES FOR EATING.

Braddick's Nonpareil
Cox's Orange Pippin
Duchess of Oldenburg
Irish Peach
King of the Pippins
Red Quarrenden
Sturmer Pippin
(Ribston Pippin, named, but not recommended)

The edition of 1898 is no longer "Fruits for Cottagers and Small Farmers," but "Varieties of Fruits." Cottagers, owners of small gardens, and farmers are advised to consult this list. It is as follows:—

I. APPLES FOR COOKING.

(*a*) *As Bushes.*

White Transparent
Lord Grosvenor
Pott's Seedling
Frogmore Prolific
Stirling Castle
Seaton House
Golden Spire
New Hawthornden
Small's Admirable
Hormead Pearmain
Bismarck
Bramley's Seedling
Lane's Prince Albert
Newton Wonder

(*b*) *As Standards or Orchard Trees.*

Duchess of Oldenburg
Ecklinville
Grenadier
Warner's King
Lord Derby
New Northern Greening
Alfriston
Bramley's Seedling
Newton Wonder
Dumelow's Seedling or Wellington

II. APPLES FOR EATING.

(*a*) *As Bushes or Half-Standards.*

Mr. Gladstone
Irish Peach, or Lady Sudeley
Devonshire Quarrenden
Worcester Pearmain
King of the Pippins
Cox's Orange Pippin
Scarlet Nonpareil, or Cockle's Pippin
Braddick's Nonpareil, or Court Pendû Plat

(*b*) *As Standards and Orchard Trees.*

Devonshire Quarrenden
Worcester Pearmain
Cox's Pomona
King of the Pippins
Cox's Orange
Blenheim Orange
Gascoigne's Scarlet

Here is certainly choice enough and to spare. Twenty-three apples for cooking, sixteen for eating—thirty-nine in all! The first and second editions select nineteen in all; this last edition gives the cottager and small farmer a choice of twenty more.

I venture to suggest that the method of naming about a dozen apples, and then reducing them to one, two, or three, is better for the cottager, if not for us all. Let us look into these lists.

Blenheim Orange, placed at the head of the list of cooking apples in the first and second editions, now disappears, and is placed among the later eating apples; it is, however, described as "an excellent apple, cooking fairly well, but slow in coming into bearing." The removal of this grandest of English apples (at all events, in good, deep soil) from the head of the old list to almost the end of the new one seems strange. Is not Blenheim Orange distinctly a cooking apple? You describe it as such in your Leader of October 22. Rivers and Veitch place it among the kitchen apples. In Mr. Barron's invaluable Report of the National Apple Congress held in 1883 it was placed fifth on the list of culinary apples selected the greatest number of times, and fifth on the list of sixty dessert apples. I am aware that in the list of apples prepared by the R H.S. for the guidance of their judges, Blenheim Orange (so named in the first, second, and third editions—called Blenheim Pippin in the schedule of the Crystal Palace Show issued by the R.H.S.) is placed among dessert apples, and excluded, therefore, as a cooking apple, but I cannot see the reason for this restriction. Few sorts sell so well for keeping, cooking, or eating purposes. An orchardist in my neighbourhood has just sold his crop for nine shillings a bushel net; some of mine have gone for eight shillings. Lord Suffield and Keswick, recommended in the first and second editions, have both been altogether ejected. The favourable remarks respecting them in the earlier editions have not sufficed to save them, nor the remarkable fact that in the election of 1883 Lord Suffield was at the head of the poll and Keswick Codlin third. Grenadier, no doubt, is intended to take their places. May I express a doubt as to the wisdom of the change? Grenadier with me has been a poor grower, as well as an unlucky tree. My soldier son, galloping round our orchard, soldier-like, hit the head of Grenadier right off as his horse swerved. The other Grenadiers seem to mourn the loss of their companion. Sturmer Pippin, too, described in the first edition as "a very fine variety," is seen no more. I took the advice offered by the committee of forty experts in 1892, planted the tree, and have no reason to repent. The Duchess of Oldenburg was originally recommended as best for a bush or half-standard; it is now recommended, but as rather suitable for standards or orchard trees. My experience coincides entirely with that of the committee who prepared the first and second editions.

The latest list, as I have pointed out, contains a number of new names. White Transparent I do not see in three or four of the best catalogues; how long has it been tested? Early Julyan bears well and sells well. Frogmore Prolific, though a good bearer and a good cooking apple, is "soft" (so Mr. Barron describes it), and is therefore open to objection. I do not see Seaton House in Mr. Rivers' catalogue of 1897-98, but it is described by Veitch as a late Stirling Castle, and may therefore be valuable. Hormead Pearmain is said, in the "Fruit Manual," to be of medium size, and the specimens displayed at the recent Crystal Palace Show must have disappointed many. The rule of the Committee of the Apple Congress, laid down at the end of their report, seems to me a golden one. They say (p. 160), "With regard to culinary apples, since so many excellent varieties of large size, &c., are now in cultivation, all those under the standard of 'large,' *i.e.*, three inches in diameter, might be with advantage at once discarded." It is only fair to add that it is described by Mr. Barron as "large."

The highest compliment in the new list is reserved for Newton Wonder, which is called "a grand apple." Your able correspondent, Mr. Harris, recently described it, if I mistake not, as "coming rather slowly into bearing"; that, too, is our experience. An old housekeeper of mine used, years ago, to impress upon me that you can never know anyone until you have "summered and wintered" with them. No apple, in my opinion, should be placed in the list of the R.H.S. until it has been tested north, east, south, and west for at least ten years—fifteen would be better. Will Newton Wonder stand that test? I do not see it named in Rivers' catalogue of 1891. The specimens at the last Palace Show were disappointing. It is a pleasure to see Lord Derby brought to the front; this, to my mind, is one of the best of our culinary apples, and has won its way to the front rank simply on its merits. "Very large," says Mr. Barron, "first quality, a fine, handsome apple, and great bearer." Should Alfriston appear in such distinguished company? The Committee of 1883 describe it as "very firm, first quality, mid-season, a moderate bearer." I should have thought that Tower of Glammis, described by the same authority as "large, flushed, firm, mid-season, first quality, a handsome apple, and a great cropper," had a prior claim. But it comes from the land o' cakes, and its merits, therefore, may not be so well known.

Among the apples for eating Cox's Pomona is mentioned, much to the surprise, I should think, of many. In the election list of culinary apples in Mr. Barron's book it is placed thirteenth, Alfriston being fourteenth. In the descriptive catalogue of the same report it has the letter C or D attached to it, but its name does not appear among the dessert apples. Dr. Hogg calls it a culinary apple. Its colour makes it attractive and saleable, but it is "tender" (Mr. Barron), and does not keep well. I ought to add that it is described in the "Varieties of Fruits" (*i.e.*, the third edition) as also good for cooking, as it undoubtedly is. But it is very soft and a bad traveller.

In the "addenda" to the "Varieties" amateurs are invited to try, among others, D'Arcy Spice. "This," remarked Mr. Bunyard's famous foreman to me about ten years ago, "is the slowest growing tree among our six hundred varieties"; and, no doubt, it is a "terrible slow coach," as pedagogues are wont to say. After ten years' trial mine are just coming into tolerable bearing. A common opinion in Essex (where it is the favourite apple, and sells at a high price in April or May) is that there are two varieties, viz., the Spice and the D'Arcy Spice. Mr. Bunting, the nurseryman, of Colchester, used to keep these varieties distinct, but he could see little or no difference between them. Let sellers beware of sending this apple to the London markets; its appearance is not in its favour. It must be sold, like a good hunter, by character.

St. Edmund's Pippin is another apple recommended to the notice of amateurs. This is a famous russet, but why name it "Pippin"? Those shown at the Palace were splendid fruit.

A friend, who was a salesman at one of the great London markets, has recently become an Essex planter, and has put down, he tells me, six thousand trees, chiefly apples. He has kindly given me the list of his trees. Most of them came from Sawbridgeworth. It is appended :—

- Blenheim Orange
- Golden Spire
- Schoolmaster
- Bramley's Seedling
- Lord Derby
- Dumelow's Seedling
- Devonshire Quarrenden
- King of the Pippins
- King of Tompkin's County
- Yellow Ingestre
- Claygate Pearmain
- Stirling Castle
- Tower of Glammis
- Lord Grosvenor
- Worcester Pearmain
- Nelson Codlin
- D'Arcy Spice (12 only)
- Bismarck
- Scarlet-Golden Pippin

Dumelow's and King of the Pippins are planted most largely. Nelson's Codlin, though evidently a first-rate apple, is described by Mr. Barron as "very greasy." Only twelve Spice apples could be secured.

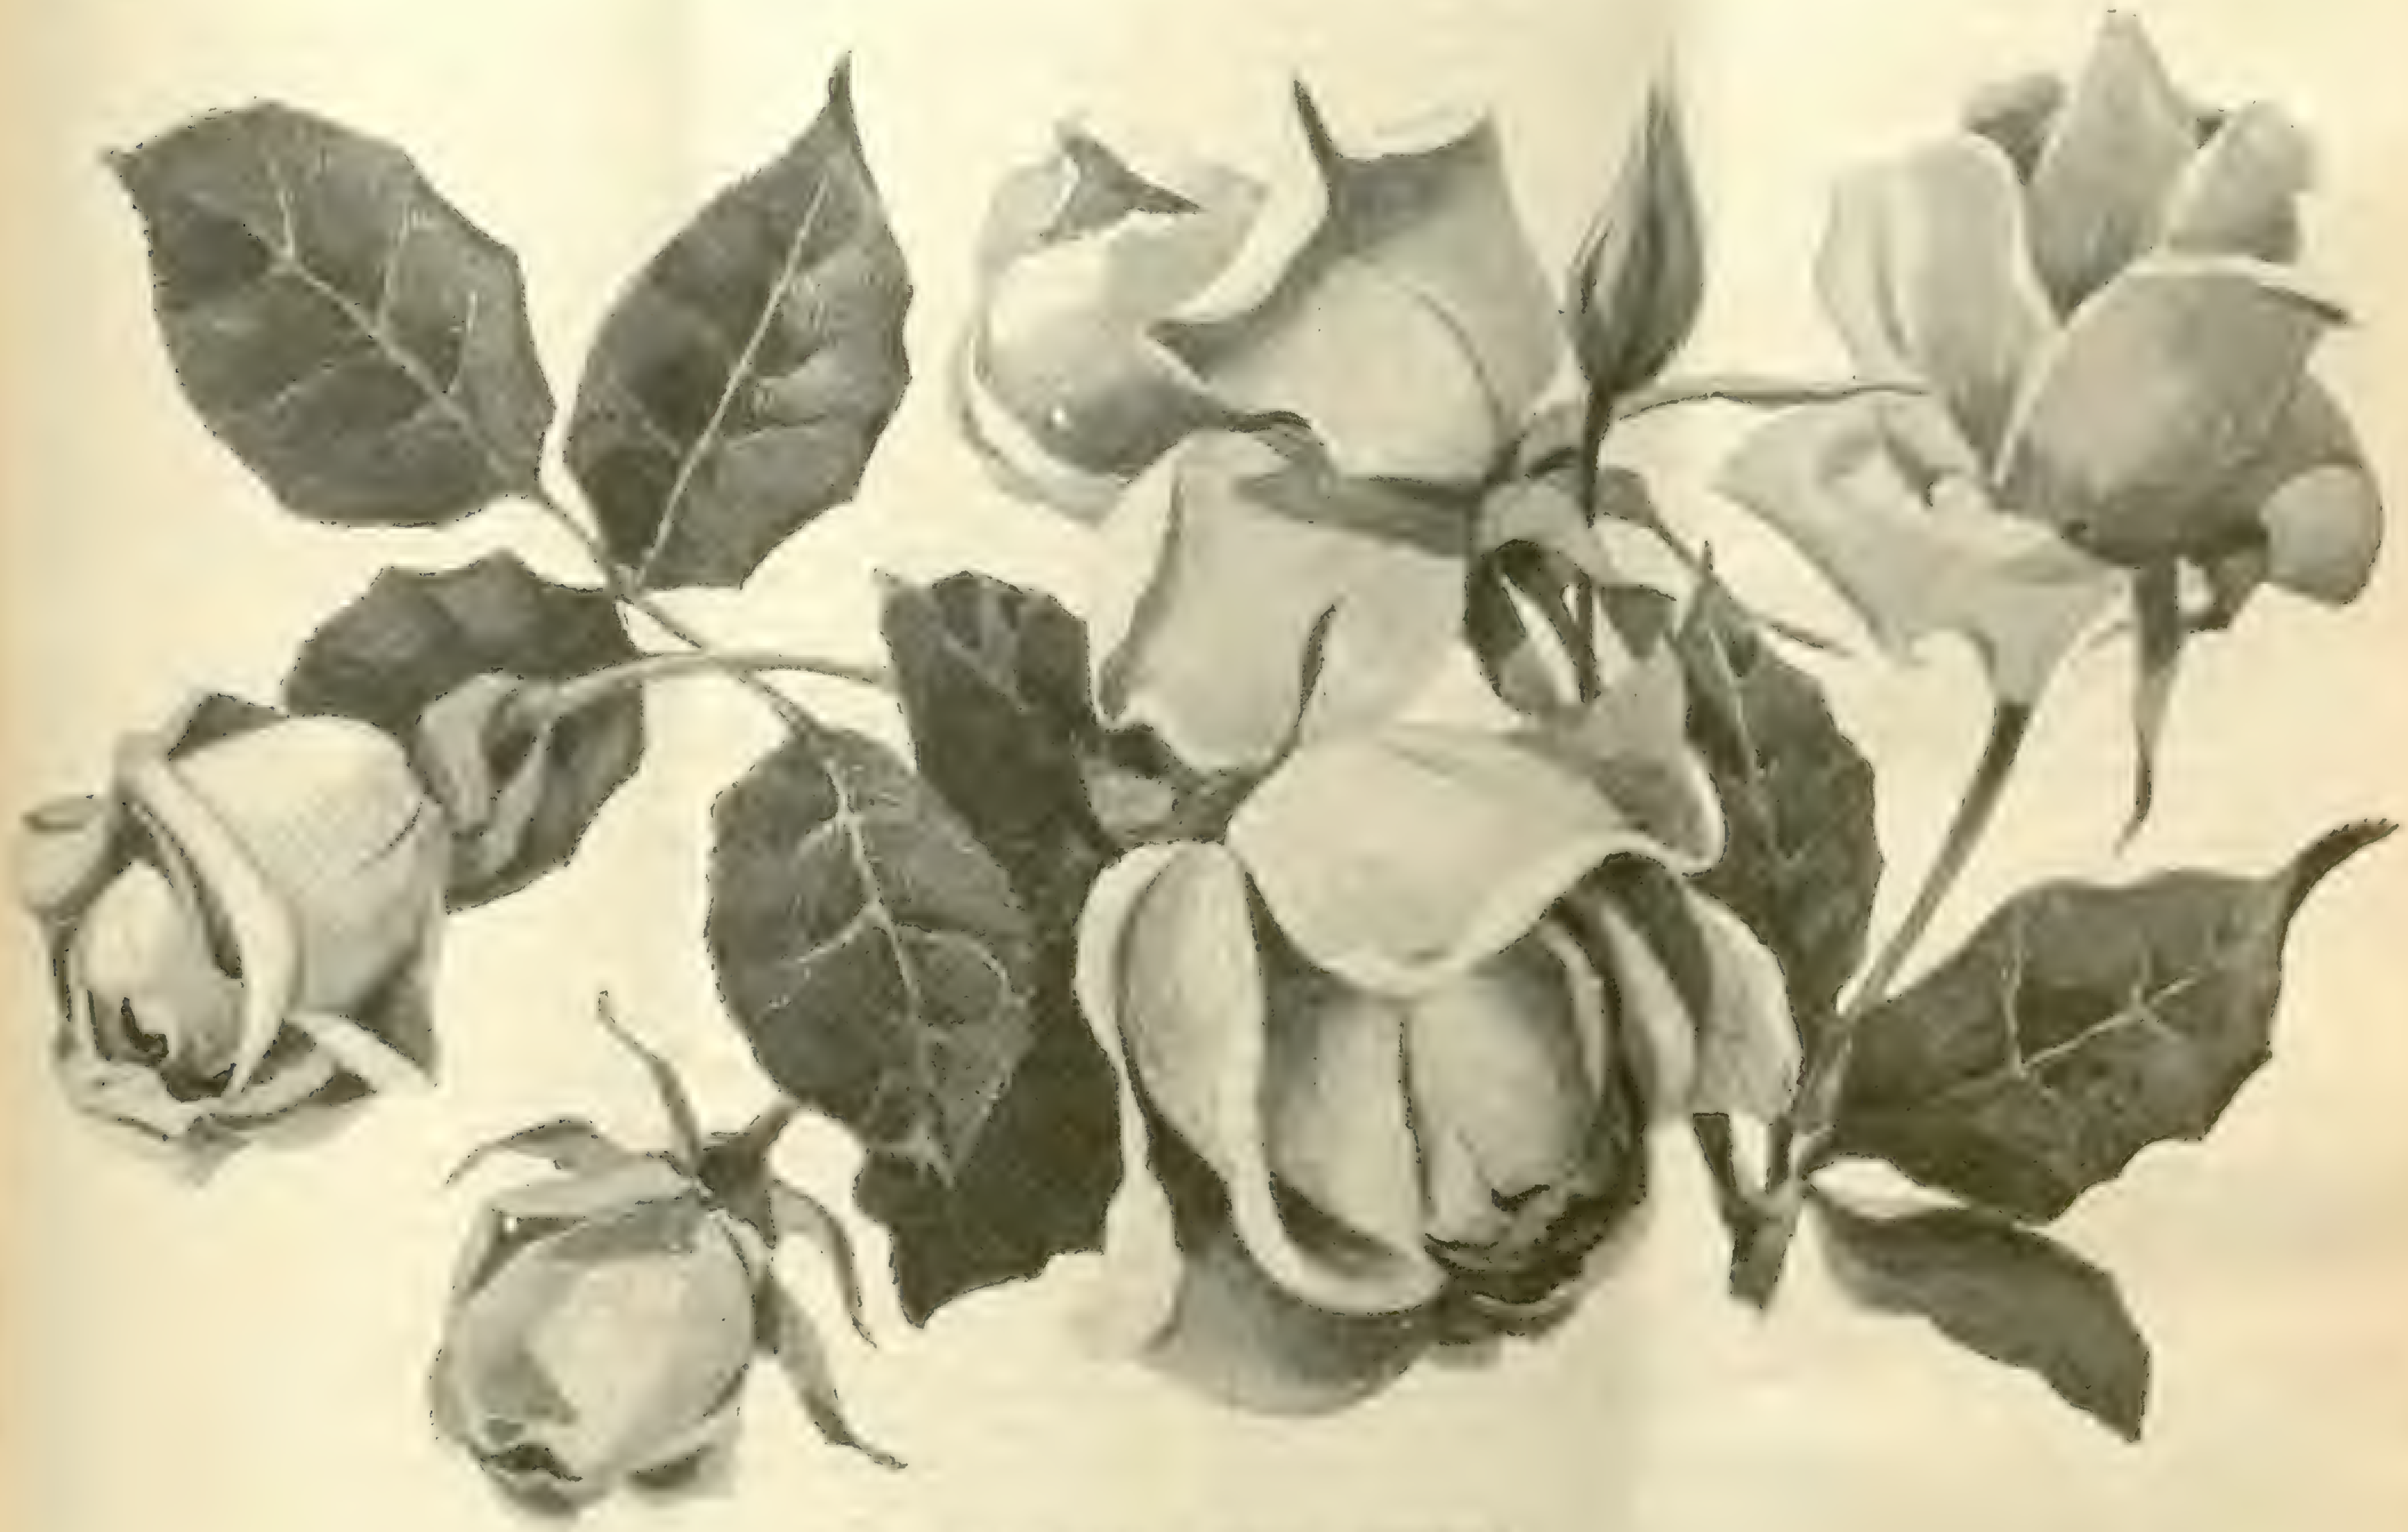
In the introductions to the first and second editions, and also to the "Varieties of Fruits," the statement is made that care has been taken to choose only varieties characterised by quality, fertility, good growth, and hardiness. May I suggest some additional and desirable features? (1) Size, in all culinary apples, according to the rule of 1883. (2) Firmness, so as to travel well. (3) Colour, when it is combined with other qualities. A bright colour, a red cheek, are always attractive. I was recently at a fruit show held at New Westminster, on the Pacific coast of Canada. The brilliant colour of the apples, as well as their size, was quite a feature of the show. No doubt the Canadian sun is warmer, but much may be done amongst ourselves if the point is kept carefully in view. (4) No apple should be recommended by the R.H.S. to the public unless it has had a probation of at least ten years in different parts of Britain.

Wakes Colne Rectory, Essex. E. BARTRUM, D.D., F.R.H.S.

The Dundee Chrysanthemum Carnival, now being held in the Drill Hall, Dundee, as we go to press, promises to be a great success, as the entries greatly exceed those of last year. The society provides forty-six classes, and offers fairly good prizes for cut blooms, plants, fruit, and vegetables. In addition there are eighteen special prizes offered, including four challenge cups and several gold, silver-gilt, and silver medals. Mr. Norman Davis provides the prizes in a most interesting class for a display of chrysanthemum blooms, foliage plants, berried plants, &c., the chrysanthemum to predominate. The energetic secretary, Mr. W. P. Laird, informs us that the society has secured the band of the Royal Scots Greys for the Thursday and Friday, and the band of the Royal Grenadier Guards for Saturday, the 26th inst. This is the strongest musical engagement available, and it is to be hoped that the enterprise of the committee will give the results anticipated. Last year's carnival at Dundee was the turning-point in the society's career, it being on a scale much larger than on previous occasions, bringing it up to the standard of the best shows in the kingdom.

TEA ROSE, SUNRISE.

OUR illustration of this pretty tea-scented rose was made from flowers exhibited in a tasteful vase arrangement at the Drill Hall meeting of the Royal Horticultural Society on October 25. Sunrise is evidently one of the freest bloomers, the growths staged having large trusses of buds and blossoms. The buds open well, and each bud is suited for personal wear or for indoor decoration. As a rose for winter forcing Sunrise is sure to become most popular, for it is free in growth, and, we are informed, has no blind or flowerless shoots. It is certainly one of the most distinct garden roses we have, and by no means its least charm is the exquisite colouring of its bronzy-purple foliage and the delightful fragrance of the blooms. The floral colouring is unique, a deep apricot in the centre and carmine upon the outside of the petal. In the bud stage, or when half expanded, it is difficult to imagine a more striking or distinctly coloured rose, and the effect is much heightened by its grand foliage. We predict a hearty welcome for this variety among all who love garden roses. Though its main usefulness may lie in its grand winter-blooming qualities, it is, nevertheless, quite hardy, a good bedder, and one of the best autumnal bloomers. Many rose authorities have seen Sunrise growing, and all speak of it in the highest praise. An award of merit was accorded the variety on the date referred to, when it was exhibited by Mr. G. W. Piper, the Nurseries, Uckfield, Sussex, who will distribute it in May next.



NEW TEA-SCENTED ROSE, SUNRISE.

Cement in Greenhouses.—When recently at Basing Park, Alton, Mr. Smythe, the gardener, drew my attention to a couple of lean-to houses, in which cement had been used to form the lower plates on the front walls instead of wood. In one case the cement plate was of the same width as the wall, four and a-half inches. In the other it overlapped, as wooden plates usually do, about one and a-half inches. But in each case the upright bars supporting the front of the house and holding the glass was not let into a wooden plate at all, but rested on the brickwork, on which was first placed a thin coat of cement to make the surface even. Then the plate was formed by filling up to a height of two inches at the sides and three inches in the centre all the space between the bars with cement, the upper edges of course being sharply sloped. When closed the glass just touched, or hardly so, the outer slopes, so that any moisture gathering on the glass inside runs down on to the outer side of the cement plate and is carried away. Such a plate is utterly impervious to moisture, and would endure much longer than even the upright bars. Wooden plates, proverbially, quickly rot, and often need replacing. Should any interstices appear in the cement close to the bars or elsewhere, they are very easily stopped with cement. The house that has the broader cement-plates is of more pretentious nature, and so admirably is the plate fashioned that no one would imagine it to be other than wood, except on close inspection. Top plates of wood are commonly fashioned, with a flat upper side. That is bad practice; the upper side should have a ridge shape, sloping partly out with the fall of the rafters, and partly in, so that so fashioned no moisture is retained on the wood.—A. D.

CHRYSANTHEMUMS AT MAIDENHEAD.

THE business established by the late Mr. R. Owen and carried on with such success for so many years has since his death been managed by his two sons, who seem to be quite as much interested in the work of growing, importing, and raising new seedling chrysanthemums as their father. Altogether they have this season something like eight thousand plants, the majority being seedlings of their own, and in the seven or eight greenhouses through which we passed we certainly saw some very promising and useful-looking novelties, which, being unnamed at present, cannot be referred to and described individually. It will be sufficient, however, to say that there is an unusually large percentage of the Maidenhead seedlings in the various shades of white, yellow, purple, and crimson, mostly, of course, in the Japanese section, but nevertheless a fair sprinkling of novelties belonging to the incurved type.

On entering the first house we were specially struck with the very finely-flowered examples of several of the plants, the chief of which, W. Bardney, is a large Japanese incurved, with broad florets of a velvety pale purple amaranth, and silvery reverse; Mrs. Philip Mann, a sport from Charles Davis, being of a golden yellow shade, flushed pale crimson.

There is a fine example of the big white Japanese Mrs. H. Weeks, and several equally good ones of the deep yellow Carnot sport called G. J. Warren. Close by is another rather striking-looking flower named David Inglis, with medium-sized florets, colour deep crimson, with golden reverse. Lucine is a large white Japanese, very full and double; and Cameo, which is the next to attract our notice, is of a charming shade of pale flesh pink, but belongs to the incurved type, and is a good, deep flower. In one corner stands a plant of Glory of the Pacific, a very free flowering, useful Japanese, not unlike the Christine family in form, but of a white colour, tinted lilac; this is regarded as a very useful variety for decoration or grouping.

Continental novelties comprise a good selection from all the leading raisers, and in another greenhouse we met with Madame Everart, a large Japanese with flat florets, white, tinted yellow in the centre; Mozart, also a Japanese, of a very rich deep shade of golden yellow, and several others. Royal Standard is home-grown, a large Japanese of dazzling crimson; Owen's Memorial is another of the same colour, but more of the Edwin Molyneux type as regards form. Mrs. C. Herrin is a Japanese incurved with numerous grooved narrow florets, colour white. Here, as at most of the trade displays, the visitor is curious to see the way in which the novelties of Mr. Ernest Calvat turn out, and they seem to be uniformly good here as elsewhere. Of these President Bevan, a big yellow Japanese incurved, already frequently described in the various reports; Tatiana, a very fine yellow Japanese; Fée du Champsaur, large white Japanese; Madame Ed. Roger, the green novelty, and most of the others to which reference has so frequently been made in our previous reports, are all noteworthy.

Other Japanese from various sources are to be found in Mrs. Chas. Birch, a Japanese incurved, slightly hairy, pure glistening white; Glory of Maidenhead, a fine Japanese, with flat florets of medium width, colour a peculiar shade of metallic crimson, reverse golden. The new Mary Molyneux, large pink; Mr. Chas. W. Cox, creamy white; Mrs. H. Perkins, also white; Mr. W. H Grenfell, deep lilac rose, are all more or less likely to attract the visitor's attention.

Among incurves one of the most regular and perfect in form is C. S. Bates, a deeply built flower of a pure golden chrome yellow. In the same section we noticed Pearl Palace, a good-looking globular form, deep and solid, colour pinkish lilac. Besides these there are some really good unnamed seedlings that are sure to be heard of next season, and to reflect great credit upon the young raisers, who bid fair to become as well known in the chrysanthemum world as their late father was.

In conclusion, we may mention that Lord Cromer is one of the most striking of the new Japanese in the collection. It is of a rich velvety reddish crimson, with a golden reverse, and makes up a bloom of great size. Madame J. Tossal is a Continental Japanese with very long, narrow florets twisted and curly at the tips, a hairy novelty of a pale lilac mauve, with silvery pink reverse. Duke of Wellington belongs to the massive type of Japanese incurved, colour golden bronze, and with the mention of these we must close our remarks on an interesting and promising collection, from which much may be expected in the near future.

STEPHANOTIS FLORIBUNDA IN COOL HOUSE.

I AM pleased to add my testimony to Mr. Day's anent the excellence of the specimen plant recently shown at Edinburgh by Mr. Lunt, of Keir Gardens, who is well known in Scotland as a skilful horticulturist. It might be well, however, to caution young growers against letting the temperature in which their stephanotis is growing to fall to 27 degrees; ten more would be far safer than this, or, say, from 35 to 45 degrees, which is quite consistent with the cool or greenhouse treatment with this sweet and beautiful plant.

The measure of cold it will endure depends very much on the dryness of the roots or the air, or the maturity of the wood. The hardiness or tenderness of the stephanotis, more than most plants, is measured by its condition, rather than its constitution. Growth made easily in rich soil and tropical heat may be severely checked, if not permanently injured, in a dry temperature of 45 degrees or under; whereas well-matured moderate growths grown in the sunlight may touch frost with impunity. There are also several strains of Stephanotis floribunda in cultivation—some with stronger shoots, larger leaves, fewer flowers, and almost certainly more tender constitution than others. As an old plant man I remember quite a rush being made after the so-called S. f. multiflora, or Elvaston variety—a very compact and enormously floriferous strain. I may be wrong, but I put Mr. Lunt's plant down as this variety as soon as I saw it. Though generally propagated from cuttings, the stephanotis occasionally shows a seed pod somewhat longer and larger than Passiflora edulis, but we seldom hear of anything equal to or better than the type resulting from the seed.

There is also another species seldom seen outside botanic gardens—S. Thouarsi—but not equal to the more generally grown S. floribunda. But there should be stated in connection with the cool treatment of this climber that while endorsing all that has recently appeared in the GARDENERS' MAGAZINE on the subject, viz., that it can be grown and bloomed well under cool treatment, I wish to add that it can be grown as well or better, and more profitably still, in tropical temperatures. I have never seen it better grown than covering the roof of a long house at Knight and Perry's (now Messrs. J. Veitch and Son's Nurseries at Chelsea). It is no exaggeration to say you could neither see roof nor rafter for sprays of leaves and flowers, and the regulation temperature was from 70 degrees to 80 degrees. As soon as I had the opportunity I ran up a house on the same lines, which produced bushels of blooms for years, and though I have had not a few, and seen many plants do fairly well in cool houses, I cannot recall a big house of Stephanotis run profitably on commercial lines with a cool temperature. Nor is the reason far to seek. The only two species yet introduced are natives of Madagascar. The plant has proved itself useful and obliging in cool houses, but it is at home in a tropical temperature. D. T. F.

EXHIBITIONS AND MEETINGS.

MANCHESTER ROYAL BOTANICAL, November 17, 18, and 19.

THE St. James' Hall is a commodious and well-lighted structure, and in every way a most suitable place for the very large show held on the above dates. This fine display was the result of an excellent rearranged schedule, together with the handsome £25 challenge cup, presented by the president, the Right Hon. the Earl of Derby, K.G.; altogether the exhibition could only be surpassed by that of the National Society, and there was plenty of light and space. Exhibitors rally round the Manchester society at all seasons, and in this new departure they have fully upheld their traditions. Although the schedule only embraced cut flowers and plants, the large hall was fully furnished; but there is no doubt if the public support this new venture Mr. P. Weathers, the courteous and energetic curator and secretary, will suggest to the council the advisability of adding a fruit section, and possibly a vegetable one, which would make Manchester the leading autumn show of the provinces. Messrs. Upjohn and Paul are to be congratulated on the staging arrangements, whilst the general regulations, under the immediate control of Mr. P. Weathers, were carried out to time and without the slightest hitch.

PLANTS.

These are all shown as naturally-grown plants, and, after the fine specimens staged, one must almost agree that this is the proper form. The class for a group of chrysanthemums and foliage plants, in circular form, and of not less than eighty square feet, brought five entries. T. Hardcastle Sykes, Esq., Cheadle (gardener, Mr. J. Roderick), secured the leading position with a most effective combination, the centre being occupied with a handsome Phœnix rupicola, banked up with good chrysanthemums, about three feet of the margin being occupied with well-grown crotons, palms, &c., on a base of ferns, foliage plants, and cork; the effect would have been considerably enhanced by a more liberal use of fern and some distinct form of edging. James Walker, Esq., Newton Heath (gardener, Mr. J. Horrocks), was second with a somewhat heavy design, but having good blooms. Miss Lord, Ashton-on-Mersey (gardener, Mr. G. Wilkes), took the remaining prize. Sets of nine large flowering plants were shown in splendid form, G. H. Gaddum, Esq., Didsbury (gardener, Mr. W. Bradburn), staging the premier lot with Duchess of Fife, Viviand Morel, Charles Davis (splendid), and C. H. Curtis, with deep blooms; Thomas Harker, Esq., Withington (gardener, Mr. Mulloy), was second with good plants; Mr. Roderick, third. For six pompons J. Brown, Esq., Heaton-Mersey (gardener, Mr. Smith), won with heavily-flowered plant, the best, being Lord Mayor, Cardinal Wiseman, Sœur Melaine, &c., Messrs Bradburn and Mulloy taking the remaining prizes. For six Japanese Mr. Bradburn won with well-flowered specimens, Messrs. Mulloy and Smith second and third respectively.

CUT BLOOMS.

Seven classes were arranged in this section, and they brought fifty-eight entries. The Derby Challenge Cup for the best forty-eight blooms, twenty-four Japanese and twenty-four incurved, distinct varieties, with four money prizes of £10, £6, £4, and £2, brought seven entries. F. A. Bevan, Esq. (gardener, Mr. W. H. Lees), occupied the position of honour with blooms highly creditable to this successful southern grower. His Japanese were: Mutual Friend, Mrs. C. H. Payne, G. J. Warren, Mrs. Lewis, Mrs. Palmer, Madame Carnot, Viviand Morel, Mrs. Weeks, Sécrétaire Fierens, Edwin Molyneux, Oceana, John Pockett, Simplicity, Colonel Carrington, Phœbus, Mrs. Shrimpton, Nellie Pockett, Edith Tabor, Eva Knowles, Elsie Teichmann, M Chenon de Leche, R. Hooper Pearson, Madelaine Davis, and C. Davis; incurved varieties: Ma Perfection, Miss V. Foster, Charles H. Curtis, Lady Isabel, W. Tunnington, Duchess of Fife, Globe d'Or, Madame Ferlat, Austin Cannell, Yvonne Desblanc, Empress of India, Mons. Desblanc, Mdlle. Lucie Faure, Major Bonaffon, Princess of Wales, Lord Rosebery, Mrs. Coleman, Lyne, jun., Mons. Martignac, Madame Darrier, Bonnie Dundee, and Jeanne d'Arc. The Earl of Harrington (gardener, Mr. Goodacre) was second with a strong stand of Japanese and grand incurved blooms of Lady Isabel, W. Tunnington, C. H. Curtis, and Miss V. Foster; Mr. Crooks was third and Mr. West fourth.

For twenty-four incurved blooms, not less than twelve varieties, the Dowager Lady Hindlip, Droitwich (gardener, Mr. Crooks), had the best out of nine lots, with Madame Ferlat, Topaze Orientale, Duchess of Fife, W. Tunnington, Chas. H. Curtis, Miss V. Foster, Madame Lucie Faure, Golden Empress, Empress of India, Egyptian, Jeanne d'Arc, Mrs. Coleman, Brookleigh Gem, George Haigh, Bonnie Dundee, and Queen of England; E. Behrens, Esq., Whitchurch (gardener, Mr. West); H. Tate, Esq., Allerton (gardener, Mr. C. Osborne); and Mr. Foster, Havant, were placed in the order named. For twelve incurved, distinct, the winners were Messrs. Foster, Crooks, and Lees, placed in the order named, Madame Ferlat, Duchess of Fife, and Dorothy Foster in the first prize lot being fine.

For thirty-six Japanese, in not less than eighteen varieties, Mr. T. Vallis, Chippenham, won the first prize and gold medal with a fine stand of G. J. Warren, Swanley Giant, Madame Carnot, Nina Dabbs, E. Molyneux, Mutual Friend, Silver King, Mrs. J. Ritson, G. W. Palmer, Yellow Carnot, Mons. C. de Leche, Lady E. Clark, Lady Hanham, Mons. G. Henry, Viviand Morel, Golden Gate, J. W. Barks, Phœbus, Silver King, Mons. Hoste, Oceana, Herman Kloss, Simplicity, M. A. Rossetta, Surpasse Amiral, M. A. de Galbert, and Boule d'Or. The remaining winners were Mr. West, with a good stand; Thomas Brocklebank, Esq., Woolton (gardener, Mr. Vaughan); and Mr. J. Davies, jun. For eighteen Japanese, not less than nine varieties, the cup-winner, Mr. Lees, was again to the fore with fine blooms, R. A. Bowring, Esq., Cardiff (gardener, Mr. Joy), and Mr. Foster following. For twelve Japanese, distinct, C. Waterhouse, Esq., Prestbury (gardener, Mr. Hall), and Messrs. T. Vallis and W. M. Low, Warwick, were the successful competitors.

For thirty-six miscellaneous blooms there were eight entries, but the small reflexed and anemones looked somewhat out of place with the Japanese giants; the prize-takers were Mr. Vaughan, J. Lamb, Esq., Bowden (gardener, Mr. Vickers), and Mrs. Banner, Huyton (gardener, Mr. R. Pinnington). The best basket of chrysanthemums, suitable for drawing-room decoration, was from Mr. Mosley, Haliwell, who had a charming light arrangement of Source d'Or and dark asparagus; Mr. Bracegirdle, Liverpool, was second with the same variety of flowers; Miss Lord was third. For three bouquets Mr. Mosley was again first with three distinct types, showing dark roses, orchids, and white flowers; Mr. Jones, Bolton, was second. The best miscellaneous collection of cut flowers came from Miss Lord (gardener, Mr. Wilkes), who staged over forty varieties; Mr. J. Smith second.

For a collection of orchid blooms Thomas Statter, Esq., Stand Hall (gardener, Mr. Johnson), won with a superb collection, arranged on a white cloth; Cattleya aurea (fine variety), Dendrobium Phalænopsis Schroederiana, Cattleya labiata in variety, and C. Bowringiana were splendidly represented. For a basket of plants the only contributor was Mr. Wilkes; but for eight table plants Messrs. Ashbrook, Lee, and Ellis were first, second, and third respectively. For six cyclamen Thomas Gee, Esq., Allerton (gardener, Mr. P. Geene). Messrs Hall and Pinnington were adjudged the winners; while for half a dozen pots of Roman hyacinths Messrs. Golden, Wilkes, and Bradburn gained the awards. The best eight pots of white primulas were shown by Messrs. Bradburn, Wilkes, and Ferguson; while Messrs Bradburn, Pinnington, and Ferguson won in a similar class of red varieties.

NON-COMPETITIVE EXHIBITS.

As already mentioned, these formed an important feature of the show. Mr. J. Cypher, Cheltenham, was awarded the society's gold medal for a charming bank of orchids, including Cypripedium insigne Sanderæ, C. i. ornatum, C. Haynaldo-Chamberlainianum, C. William Lloyd, Vanda cœrulea, fine spikes in many tints, Dendrobium Phalænopsis Schroederiana, and many others, making this exhibit one of interest and beauty. Mr. John Robson, Altrincham, also gained a gold medal for a very meritorious group of orchids in which odontoglossums, cattleyas, cypripediums, oncidiums, &c., played a prominent part. Messrs. Dickson and Robinson, Manchester, secured the society's silver medal for a bank of plants of Begonia Gloire de Lorraine, cyclamen, and a margin of potatos. Messrs. W. Clibran, Altrincham, were the recipients of a like award for a large variety of charming single chrysanthemums, Emily Clibran, pale terra-cotta colour; Lucie Clibran, bright; and Felix were especially noticeable. This firm also staged a group of celosias. Messrs. Dickson, Brown, and Tait, Manchester, had a background of foliage plants, which set off to advantage masses of lily of the valley and Begonia Gloire de Lorraine, for which a silver medal was awarded.

Messrs. W. and J. Birkenhead, Manchester, contributed a collection of ferns in great variety, which was also awarded a silver medal. Messrs. Cowan and Co., Gateacre, received a similar mark of esteem for a miscellaneous group of Acalypha hispida (Sanderi), ericas, Cattleya labiata, Vanda cœrulea, and other orchids. Messrs. H. Cannell and Sons, Swanley, gained a silver medal for a fine collection of cut zonal geraniums, cannas, and chrysanthemums; certificates of merit were granted for chrysanthemums Mrs. Filkins and Madame Gabriel Debrie. Mr. H. Deverill, Banbury, for his exhibit of magnificent onions was awarded a silver medal. Mr. E. Ashworth, Wilmslow, received a first-class certificate for Vanda cœrulea with four spikes carrying thirty-three flowers. Mr. R. Eichel gained a certificate for Odontoglossum Humeianum Masoni.

Mr W. Wells, Redhill, staged a collection of chrysanthemums, and gained certificates for Nellie Pockett, John Pockett, Mr. T. Carrington, and President Bevan. Other contributions were sent by Mr. W. Boond, Lymn, Cheshire, cut chrysanthemums; Messrs. Isaac House and Son, Bristol, a collection of cut violets; Mr. W. J. Godfrey, Exmouth, cut chrysanthemums; Messrs. Heath and Son, Cheltenham, a collection of orchids; Mr. W. Edwards, Nottingham, pottery and ferns. From the society's own gardens came an immense group, twenty-five yards long and sixteen yards wide, of stately palms and other tall foliage plants, with chrysanthemums grouped in distinct colours and intermixed with crotons, dracænas, and richly coloured Acalypha Macafeeana, the whole forming a huge and attractive bank nearly in the centre of the room.

RUGBY, November 16 and 17.

SINCE the days of the renowned Dr. Arnold the schools of Rugby have placed the town in the foremost rank of educational centres, and it is only fitting, therefore, that horticulture should receive a share of the public attention. It has been the work of the Rugby and District Chrysanthemum, Fruit, and Horticultural Society to support and extend the local interest in gardening, and by means of its annual show to provide a stimulus of distinctly educational value. The objects of the society have been well carried out during the past twelve years by a strong committee and an able secretary (Mr. W. Bryant), and the exhibition for the present year, held in the Town Hall last Wednesday and Thursday, well maintained the reputation won in preceding years.

Whether it was due to the effects of a trying season or to an alteration in popular taste it is not easy to say, but the fact has to be recorded that, while the Japanese blooms were all that could be desired both in numbers and quality, the incurved blooms were just as poorly represented. It would be very regrettable if this distinct class of chrysanthemums were allowed to decline, for, great as are the attractions of the popular Japanese, there is a charm and refinement about well-grown incurved blooms that others can appreciate besides the florists of the old school.

The most important of the cut bloom classes was that for twenty-four Japanese, distinct varieties, in which liberal money prizes brought three strong competitors. Exceptional success attended the efforts of Mr. A. Chandler, gardener to A. James, Esq., Coton House, Rugby, for not only was he first in the class just named, but he secured a similar place with eighteen and twelve Japanese, his contributions forming the best part of the show in this department. The blooms in the class for twenty-four were remarkably fine, and the examples of most of the following varieties have been surpassed in very few cases this season. Those staged were Mad. Gustave Henry, Australie, Mrs. J. W. Barks, W. Wright, Mrs. W. Mease, E. Molyneux, G. J. Warren, Mrs. G. W. Palmer, M. Hoste, Mrs. Herman Kloss, Pride of Exmouth, Graphic, Mad. L. Remy, Mrs. C. H. Payne, Mad. Carnot, M. Chenon de Leche, Phœbus, Silver King, Lady Ridgeway, Emily Silsbury, Ethel Addison, M. Gruyer, M. Panckoucke, and R. Dean. Mr. Pearce, gardener to S. Loder, Esq., Floore, Weedon, was second in the twenty-four Japanese class, and Mr. Blakeway, gardener to T. A. Muntz, Esq., M.P., Dunsmore, Rugby, was third, both staging good blooms effectively arranged in their respective stands, but the difference between these and the first was sufficiently well marked to occasion the judges little trouble in making the awards. Mr. Chandler's first prize stand of eighteen Japanese included representatives of most of the varieties in his other stand, and Mr. Blakeway was there again second, Messrs. Chandler, Pearce, and Blakeway winning the prizes for twelve Japanese in the order named. Classes confined to the district were also provided for Japanese blooms, and with twelve distinct varieties first honours were gained by Mr. Mackay, gardener to E. Edwards, Esq., Horton Crescent, Rugby, who had medium size blooms, but very fresh and bright; the second prize went to Mr. Robinson, gardener to Mrs. Caldecott, The Lodge, Rugby; and the third to G. Steel, Esq., Barby Road, Rugby, these three exhibits being all fresh and [illegible] in merit. First and second prizes were awarded to Mr. Chandler and Mr. Pearce respectively for twelve incurved blooms, neat and even, but in no degree remarkable.

During the years we have known the Rugby Show there has been no advance in the specimen plants exhibited, and it is a pity some grower will not take the [illegible] to show by a few examples what can be accomplished by skill and care in the matter. Groups were attractive, but the space is rather limited, and they are not in consequence seen to the best advantage. Three classes were provided, but the entries were not numerous, and the best exhibits were those which gained leading prizes for Mr. Robinson, Mr. Whyman, gardener to Miss Bennett, The Firs, Rugby, E. A. Scott, Esq., The Lawn, Rugby, and Mr. E. Andrews, Oxford Street, Rugby.

Hardy fruits, particularly apples and pears, occupied a large proportion of the available table space, and the majority of the exhibits were of considerable merit. Mr. Harman, gardener to the Right Hon. the Earl of Denbigh, Newnham Paddox, Lutterworth, won the premier awards both for dessert and culinary varieties, having well-grown fruits of the following varieties—Dessert: Cellini, King of the Pippins, Adam's Pearmain, and Cox's Orange. Culinary: The Queen, Peasgood's Nonsuch, Gascoyne's, and Lord Derby. Other good exhibitors were Mr. S. Cole, gardener to Earl Spencer, Althorp Park, Northampton, with Messrs. Pearce, Blakeway, and Daniels.

Vegetables are well grown in the Rugby district, both by professional gardeners and cottagers, and the classes devoted to these exhibits are always well filled. Mr. S. Cole was awarded first prize for an admirable collection of eight kinds, staging excellent onions, celery, potatos, leeks, cauliflowers, carrots, and beet. Mr. Blakeway was a close second, and Mr. Robinson third. In the other classes potatos, carrots, parsnips, celery, onions, savoys, and cauliflowers were all well and numerously represented. Floral decorations and tables were not very abundant, nor were they so tasteful generally as we have seen them in previous years.

BIRKENHEAD, November 16 and 17.

THIS exhibition was held in the large hall, Grange Road, Birkenhead, and was opened by the Mayor. The exhibits were hardly up to the usual number, but the quality was of the usual good order.

Cut blooms were the most important feature, and for the cup presented by Mrs. Stitt, for twelve Japanese and twelve incurved distinct varieties, E. Ellis, Esq. (gardener, Mr. J. Davies), won with a strong stand of Japanese containing the following: Ella Curtis, General Roberts, Australie, Souv. de Mad. Rosette, Viviand Morel, Mons Chenon de Leche, Mutual Friend, Lady Ridgeway, Chas. Davis, Mrs. H. Weeks, Mathew Hodson, and G. J Warren. Incurved: Topaze Orientale, Miss D. Foster, Ma Perfection (fine), Bynum Schiltges, Duchess of Fife, Golden Empress, Rena Dula, Harold Wells, and Mrs. R. C. Kingston; C. J. Procter, Esq. (gardener, Mr. J. Williams), was second; and J. H. Ismay, Esq. (gardener, Mr. W. Neish), third For twelve Japanese distinct Mr. J. Davies won, with fresh blooms of Mrs. G. W. Palmer, G. C. Schwabe, Viviand Morel, &c.; the remaining prizes were won as in the preceding class. In the class for twelve incurved distinct varieties Mr. Davies still continued at the front, the remaining prizes falling to Messrs. Neish and Williams.

In the local class for twelve Japanese distinct Mr. Davies still held his own, with W. H. Jones, Esq. (gardener, Mr. G. Broady), and Mr. J. Williams second and third respectively. Mr. Davies was also first for twelve incurved, distinct, followed by Messrs. E Broady and W. Thomas. For six varieties the prize-takers were G. R Clover, Esq. (gardener, Mr. P. Barber), R R. Anderson, Esq. (gardener, Mr. J. Evans), G. Webster, Esq. (gardener, Mr A. Brown). For the six incurved, one variety, E. C. De Wolf, Esq. (gardener, Mr. R. Laird), and Mr. P. Barber were the winners. In the class for those who had never won a prize Mr. Hughes was successful for Japanese and incurved varieties.

For a group of chrysanthemums in semi-circular form, arranged on a space of seventy square feet, a silver challenge cup, the gift of C. Gatehouse, Esq., was offered, together with a sum of money, as first prize, and was won by last year's winner, E. R. Laird, Esq. (gardener, Mr S. E. Haines), who is now the owner of the cup; the plants carried but one flower each, were in six-inch pots, and were neatly named by small labels attached just under the blooms; ferns and palms were used to hide the pots. For one untrained chrysanthemum Mr. W. Laird was first with a well-flowered Viviand Morel. Other prize-winners in the plant classes were Messrs. J. W. Totty, T. Edwards, A. Brown, W. Neish, W. Thomas, and W. Kinsall.

Fruit in most classes was of high order, and for four dishes Mrs. Paterson (gardener, Mr. T. Ferguson) had the premier lot in Alicante grapes, Ribston Pippin apples, and immense Gros Calabasse pears. W. E. King, Esq. (gardener, Mr. J. Davies), Leominster, second. For two bunches of black grapes D. Wilson, Esq. (gardener, Mr. T. Reid), won the first prize and Mrs. Colbain's medal with large bunches of Barbarossa. Mr. Reid again won for two bunches of white grapes with Trebbiano; Mr. M. Clary, second, with Muscat of Alexandria. For eight dishes of culinary apples Mr. J. Davis won with a grand lot, Mère de Ménage being fifteen inches in circumference; Mr. W. Morgan, Leominster, was second. For six dishes of dessert Mr. J. Davis was again to the front with Ribston Pippin, Keddleston Pippin, and King of the Pippins, Cox's Orange Pippin, Blenheim Pippin, and Peasgood's Nonsuch. In the local classes Messrs. J. Lee, J. Williams, H. Reynolds, and S. E. Haines were the chief winners.

Exhibits not for competition were staged by Messrs. R. P. Ker and Sons, cyclamen; Messrs. Dicksons, fruit and dahlias; and Mr. W. Henderson, group of chrysanthemums. The arrangements were ably carried out by Mr. Bassett (secretary) and his committee.

OXFORDSHIRE CHRYSANTHEMUM AND FRUIT SOCIETY,

November 15.

THE thirty-sixth exhibition was held in the New Corn Exchange, Oxford, and, although the day was dull, with drizzling rain, the attendance was good. Owing to the fact that the new Exchange is of smaller area than the old one pulled down, the classes for plants have had to be seriously curtailed, and there was a corresponding lack of interest among cultivators. On this occasion there were in competition no less than four groups of from eighty to ninety plants each; sixty specimen and trained plants; three dozen double and single primulas; six hundred large specimen cut blooms, besides the pompons or rosette forms which are shown in threes; one hundred and eighty dishes of well-ripened apples and pears, representing about two thousand five hundred fruits; a dessert set of seven dishes; black and white grapes, and about fifty dishes of vegetables, the whole entirely filling every inch of table and staging space available. In addition to the products in competition, mention may be made of the very fine group of chrysanthemums staged by Mr. Thomas Whillans, gardener to the Duke of Marlborough, Blenheim. In the competition the second prize group arranged by Mr. W. Howell, gardener to G. H. Morell, Esq., M.P., Headington Hill Hall, only lacked a little finishing to have secured the post of honour. The plants were sturdy and well furnished with healthy leafage and flowers of immense size; the first prize group, while possessing a large variety of good forms, secured the award mainly for its effect. The best six trained plants were staged by Mr. T. W. Jacob, gardener to Dr. A. A. Rambaut, Radcliffe Observatory, which were well worthy of the award made, the class for six Japanese containing a fair percentage of quality, the award going to

Mr. A. E. Kirtlington, gardener to the Rev. R. F. Dale, Bletchington Rectory. Double and single primulas were fairly meritorious, as staged by Mr. G. Jacob, Witney.

The cut blooms were a fine feature, the stands for twenty-four incurved being closely matched. The chief award, however, fell to Mr. G. Price, gardener to F. P. Bulley, Esq., Marston Hill, Fairford; Mr. W. J. Johnson, North Bar, Banbury, second; Mr. S. Brown, Aynho Park Gardens, third, the premier stand of twelve varieties coming from Mr. R. Hope, gardener to Captain Orr-Ewing, Bletchington Park, the same exhibitor leading for twelve of one variety with perfectly finished specimens of C. H. Curtis; Mr. C. Marcham, gardener to G. W. Bennett, Esq., Tiddington House, second, with Miss M. A. Haggas, while the best forms of incurved selected from the whole of the stands were C. H. Curtis, first, exhibited by Mr. R. Hope; Madame Ferlat, second, staged by Mr. Price; and James Murray, third, exhibited by Mr. Kirtland. In the Japanese class for twenty-four flowers distinct Mr. Marcham was in fine form, many of the leading Japanese being prominent in his stand; Mr. Brown, second; and for a dozen varieties Mr. Hovell was well to the fore, having, among other good forms, a grand development of Mrs. H. Weeks (which stood a fair chance of being selected as the premier bloom, an honour it just missed through indifferent posing); Mr. Price, second, and Mr. D. J. Macfarlane, gardener to Harvey du 'Cros, Esq., Cornbury Park, third. For twelve of one variety the prize fell to a very level dozen of Mons. Chenon de Leche, staged by Mr. C. E. Munday, gardener to Aubrey Harcourt, Esq., Nuneham Park; stands of Madame Carnot and Viviand Morel securing the second and third awards for Messrs. Hope and Macfarlane; while the premier flowers in this section were Madame Carnot; second, Viviand Morel; third, G. J. Warren, selected from the stands of Messrs. Marcham, Price, and Hope. Pompons, staged in triplets, are always shown well, and, seeing how pretty a section they are when well grown, the wonder is that more societies do not provide for them in their schedules; the winners of prizes in this district were Messrs. G. Price, J. L. Burgess (Fairford), A. E. Kirtland, and J. Holton, Worcester College Gardens. The large flowered anemones and reflexed forms also prove attractive classes, Messrs. Price, Johnson, Hope, Burgess, and R. Wadham (Steeple Aston) dividing the honours.

The fruit was remarkably good. In the dealers' classes Mr. H. Smart, The Market, Oxford, was first for a choice dessert set of seven dishes and twelve dishes of apples; Mr. Holton for six and three dishes of pears (open), the best half-dozen dishes of apples (grower's) being staged by Mr. C. O. Walter, Wantage, Berks; the two premier dozens of Blenheim Pippins secured the awards to Mr. G. Salter, Summertown (one of the founders of the society in 1863), and Mr. H. Smart. The best white grapes came from Headington Hill Hall Gardens, the finest black being those exhibited by Mr. S. Brown.

In addition to the extra production referred to at the commencement may be mentioned a fine collection of cactus dahlias, posed in triplets, from Mr. J. Johnson, Garsington Nursery; and a large group of scarlet salvias set in a mass of ferns and foliage plants from Headington Hill Gardens.

BRISTOL, November 16.

A VERY fine exhibition indeed rewarded the efforts of the committee of the Bristol Chrysanthemum Society. The huge Drill Hall was filled to overflowing with subjects of a very high order of merit; the schedule of prizes comprising nearly one hundred classes brought together a great variety of things, for there were splendid groups of chrysanthemums and cut flowers of all the types. There were specimen ornamental foliage plants, groups of mixed flowering and foliage plants, table plants, primulas, &c. There was a very fine and varied assortment of fruits and collections of high class vegetables. In addition an anteroom was filled with the exhibits of the members of the Bristol Amateur Horticultural Society. The exhibits were admirably staged by E. G. Cooper, the secretary, and his staff, and the work of judging was carried out smoothly and expeditiously; the weather was close and dull, but there was a very large attendance.

Specimen chrysanthemums were shown in several classes, and many of them, in the form of partly trained bush plants, were very good. We missed the fine examples of trained incurved varieties we used to see at Devizes and other places in the West of England years ago. The Japanese varieties were in force, well grown and flowered. By the time judging was over the crowd of visitors became so dense that it was practically impossible to gather up particulars, but most of the specimens were decidedly good collections of ornamental plants, forming a noble bank in the centre of the Drill Hall, palms, crotons, luxuriant ferns, &c., being very prominent; and these were flanked on one side by a table containing the cut flowers of chrysanthemums shown in the more important classes, and on the other side by a table of fruit, grapes, fine pears, and brilliantly coloured apples being very prominent.

The short time at our disposal enabled us to gather up particulars of only a few of the leading classes, but in one of the classes for a group Mr. W. H. Bannister, gardener to H. St. Vincent Ames, Esq., took the first prize with an arrangement of exceptional quality, grand chrysanthemums being alternated with palms, crotons, and other suitable and effective plants—a group which formed one of the chief features of the show. Mr. A. Ross, gardener to W. E. George, Esq., was second, also with a very meritorious group, and Mr. G. Newberry, gardener to J. Saunders, Esq., was third. These groups were placed round the sides of the hall, and were highly effective.

The chief interest centred in the classes for cut flowers of chrysanthemums. There were several collections of thirty-six Japanese, allowing of two blooms of one variety to be staged, the first prize carrying, in addition to one of liberal money value, the possession of the Challenge Vase of the Bristol Chrysanthemum Society; this was won by Mr. G. W. Drake, Cardiff, who had Mrs. J. Lewis, a splendid bloom, which was awarded the Silver Medal of the National Chrysanthemum Society as the best bloom in the show; Master H. Tucker, Mrs. C. Blick, G. J. Warren, Elsie Teichmann (very fine), G. C. Schwabe, Australie, Madame Carnot, Thomas Wilkins, Madame G. Henry, Duchess of Wellington, Mons. C. de Leche (very fine), Surpasse Amiral, Graphic, Lady Northcote, Mrs. C. H. Payne, Miss Mary Molyneux, &c. Mr. G. Runnacles, gardener to R. Whitehead, Esq. was a good second, showing much the same varieties as Mr. Drake; and Mr. Thomas Wilkins, gardener to Lady T. Guest, the holder of the vase last year, was third. The best twenty-four incurved were staged by Mr. J. Dumble, gardener to Sir E. G. Phillips, Bart., Picton Castle, Haverfordwest, who had very fine blooms of Madame Ferlat, Miss Dorothy Foster, Globe d'Or, Golden Empress, Chrysanthème Bruant, C. H. Curtis, Ma Perfection (very fine), Bonnie Dundee, Queen of England, Violet Tomlin, Topaze Orientale, &c., some of the foregoing being in duplicate. Mr. G. Runnacles, gardener to R. W. Whitehead, Esq., Bristol, was a good second. His leading blooms were Empress of India, C. H. Curtis, Bonnie Dundee, Major Bonaffon, Lord Wolseley, Ma Perfection, &c.; third, Mr. T. Wilkinson, gardener to the Rev. Talbot Greaves, M.A., Bristol.

The best twelve Japanese came from Mr. H. Baker, gardener to Mrs. H. A. Smith, Chepstow; the following were very fine: Viviand Morel, Australian Gold, Madame Carnot, M. Chenon de Leche, Simplicity, Mons. Panckoucke, Charles Davis, and Edwin Molyneux; second, Mr. H. A. Allen, Penarth, having very good blooms of Mrs. Lewis, Mrs. G. W. Palmer, M. Chenon de Leche, Joseph Brookes, &c.; third, Mr. G. Sutton, gardener to W. A. Ford, Esq. Stands of twelve Japanese incurved were also shown.

The best twelve incurved came from Mr. W. Cartwright, gardener to A. R. Bayley, Esq., Frome, who had capital blooms of Violet Tomlin, Emile Nonin, shown in a good incurved form, Madame Ferlat, Mrs. E. S. Egan, Mrs. R. C. Kingston, Ma Perfection, &c.; second, Mr. W. Robinson, gardener to Lord Ludlow, Wenbury. Mr. G. Dumble had the best six incurved; in fine character were Madame Ferlat, Miss Dorothy Foster, C. H. Curtis, Lady Isabel, Mdlle. L. Faure, and W. Tunnington.

There were some good stands of twelve large-flowered anemone varieties. Mr. W. Robinson was placed first with W. W. Astor, Enterprise, John Bunyan, Mrs. Judge Benedict, Sir Walter Raleigh, &c.; Mr. C. Cooper, gardener to W. M. Smith, Esq., was a good second; and Mr. J. Aplin, gardener to W. M. Baker, Esq., Gloucester, was third.

It was pleasant to see the old reflexed varieties in good form. Mr. W. Carpenter had the best twelve, and Mr. G. Farmer, Tewkesbury, was second.

The best six new varieties were staged by Mr. T. Wilkins, chief among them being Lady Ridgeway, Lady Hanham, Mrs. G. W. Palmer, and N.C.S. Jubilee; Mr. G W. Drake, Cardiff, was second. The best three blooms of any Japanese variety of 1897-98 was G. J. Warren, from Mr. R. Morse, gardener to Captain Natchbull; Mr. H. A. Smith, Chepstow, was second, with the same; and Mr. T. Wilkins, third, with Surpasse Amiral.

Special prizes were offered by Mr. W. J. Godfrey for nine vases of feathery, spidery, plumed, or hairy varieties, which brought a good and interesting competition.

The amateur contributions filled a large separate room, and formed an interesting show in themselves, and there was keen competition in all the classes. Various plant classes were also comprised in the schedule, orchids being a leading feature.

Fruit was numerously represented, though it was scarcely up to the quality of last year. The best six dishes came from Mr. J. Wickers, who had Mrs. Pince's Muscat and Muscat of Alexandria, two dishes of pears, one of apples, and a melon. Mr. W. Warren, gardener to T. Jones, Esq., was second, he having Gros Colmar and Muscat of Alexandria grapes, pears, apples, and nuts. The Veitch Memorial Medal and £5 offered for the best eight bunches of grapes were won by Mr. T. Coote, gardener to T. E. Taylor, Esq., having two bunches each of Lady Downes, Alicante, Gros Maroc, and Muscat of Alexandria. Apples and pears were very numerous, and there were classes for two bunches of grapes. Mr. W. Carpenter was first with very well finished Muscat of Alexandria, and Mr. Coote was second. Mr. Coote had the best two bunches of Alicante, very good. Mr. Marshall, gardener to J. Dole, Esq., was second. Mr. W. Robinson came in first with Lady Downes, Mr. T. Wilkins being second. Mr. W. Taylor, gardener to C. Bayer, Esq., Forest Hill, was first with Gros Colmar, and Mr. W. Warren, gardener to T. Jones, Esq., Gloucester, second. Mr. T. Wilkins was first with Mrs. Pince, of good colour and fine in berry; Mr. A. Ross, gardener to W. Gray, Esq., was second.

Vegetables were largely shown in competition for special prizes by Messrs. Sutton and Sons, Carter and Co., Garraway and Co., and others, and they were generally of fine quality.

Several miscellaneous exhibits were staged, chief among them bouquets and pretty floral decorations from Messrs. Brown and Son, Bristol; fruit, &c., in good character from Messrs. J. Garraway and Co., Durdham Down; and choice table decorations, &c., from Messrs. Parker and Son, Bristol.

MALVERN.

THIS society has been inaugurated during the present year, and held its first show on November 10 and 11 in the Public Assembly Rooms, Great Malvern. As a first effort the show is a distinct and encouraging success, for though the entries were not numerous the quality of the exhibits was good, and in some cases distinctly above the average. Some excellent non-competitive contributions of miscellaneous plants, flowers, and fruits were sent by the nobility and gentry of the neighbourhood, amongst whom Earl Beauchamp, Lady Howard de Walden, and C. W. Perrins, Esq., were especially liberal in their support. Exhibits by trade growers also assisted very materially in producing a charming little show.

The principal class was for twenty-four cut blooms, Japanese, in not less than eighteen varieties. The prize of £5, however, failed to attract more than three entries. The first prize was awarded to a very nice fresh lot of well-grown blooms, of which the best were Mrs. Palmer, Edith Tabor, Madame Carnot, Chas. Davis, Phœbus, Rose Wynne, Col. Smith, Niveus, G. C. Schwabe, and Pride of Madford. These came from Mr. Smith, gardener to R. C. B. Cave, Esq.; the second was awarded to Mr. G Ridley. The groups were extremely well done; that put up by Mr. Crump, gardener to Earl Beauchamp, Madresfield Court, was an easy first, and gave an object-lesson in the association of elegant foliage plants with well-grown blooms of chrysanthemums. The arrangement left nothing to be desired, and the selection of a preponderance of clear yellow and bright-coloured varieties had a distinct advantage over the use of the pale or undecided tints of some which are frequently employed in groups. Mr. Crump also led with a beautiful table decoration, in which class there were five entries, all of considerable merit.

There were three exhibits in a class for large blooms to be shown in a vase with suitable foliage, and these produced an excellent effect. It is by far the most charming way in which to show the best qualities of the flowers; the monotonous appearance of blooms shown on boards in the usual manner, stripped of their foliage and thereby shorn of half their charm, is becoming more and more apparent to managers of horticultural shows. It is very satisfactory to note that almost every society now offers encouragement for the exhibition of blooms with their natural foliage, and doubtless the time is not far distant when this method of presenting the flowers in all their pristine freshness and beauty of foliage will become the required condition in all the most important classes.

Worcestershire is famous for its fruit, and one found at Malvern very fine samples of hardy kinds as well as products of well-managed vineries. The fine samples of Doyenne du Comice pear, with various others, and clean, bright dessert apples could not well be surpassed in any exhibition. With such a promising first attempt Malvern may well look forward to a large share of support both financially from the resident public and at the hands of exhibitors. The excellent accommodation of the Assembly Rooms renders it a capital home for a fine show, and, judging from the attendance on Thursday, one may congratulate the executive with a "well done, Malvern!"

ROYAL HORTICULTURAL SOCIETY, November 22.

DESPITE the bitter north-east wind blowing and giving us the first real taste of winter there was a very interesting show at the Drill Hall on the above date. Chrysanthemums were the principal subjects on view, and of chrysanthemum exhibits that of Mr. Davis was the best and most attractive.

FLORAL COMMITTEE.

An exceptionally handsome and beautiful display of chrysanthemums was put up by Mr. Norman Davis, Framfield, Sussex, who had a large table to himself, and staged the exhibit of the meeting; two tall vases filled with big blooms of Western King were put at either end, and, between these, large Oriental vases of Julia Scaramanga and Souvenir de Madame Rosette. Smaller vases, placed amid palms, crotons, aralias, &c., contained Lady Hanham, J. R. Upton (a new yellow), Tuxedo (very bright), Clinton Chalfort, and the golden King of the Plumes. A huge basket of single varieties occupied the central position. In addition to all these fine flowers, tastefully disposed, there were magnificent stands of Madame Carnot, all grand exhibition blooms; G. J. Warren was shown in equally fine condition. The whole beautiful display was one of Mr. Davis's best efforts, and merited a gold medal.

Mr. C. J. Salter, gardener to T. B. Haywood, Esq., Woodhatch, Reigate, put up some beautiful chrysanthemums, thirty-six good flowers, the most interesting being M. Chenon de Leche, G. J. Warren, Madame Rozain, Madame Carnot, Lady Hanham, and Edith Tabor; silver Banksian medal. Mr. W. J. Godfrey, Exmouth, staged an extensive display of chrysanthemums, containing about seven dozen blooms, besides bunches of good decorative sorts; Orphée, a creamy rose Japanese anemone; Lord Coleridge, yellow, incurved; and Chatsworth, Le Grand Dragon, and Rudd's Red Japanese, with Wm. Neich, Mdlle. Lucie Faure, Mrs. Egan, and M. Fatzer, incurved, were all well shown, and represented newer varieties. Mr. N. Molyneux, gardener to J. C. Garnier, Esq., Rookesbury Park, Fareham, showed handsome flowers of Miss Nellie Threlfall, Golden Gem, and Earl of Crawford, respectively cream, golden, and deep rose incurved varieties. Mr. W. Weeks, gardener to Lady Byron, Thrumpton Hall, Derby, showed some beautiful chrysanthemums, notably good specimens of Mrs. Cursham, Henry Weeks, Edith Dashwood, Emily Towers, Little Nell, Miss Maud Douglas, a broad-petalled bright rose form, Mrs. Barkley, and a number of interesting seedlings.

A large exhibit of chrysanthemums came from Mr. W. Wells, Redhill, Surrey, who in addition to stands of large exhibition blooms of Julia Scaramanga, Australie, Mr. T. Carrington, Nellie Pockett, Surpasse Amiral, John Pockett, Chatsworth, Julian Hillpert, President Bevan, &c., showed large bunches of such charming single forms as the creamy Earlswood Beauty and its new white sport named Daisy Brett, Sam Casswell, and other decorative forms; we also noted the new yellow hairy form Leocadie Gentils and the fine crimson Owen's Memorial, and a new soft rose incurved named Mrs. Arthur Jack, a pretty form with narrow, pointed florets; silver Banksian medal. Mr. A. H. Rickwood, gardener to the Dowager Lady Freake, Twickenham, put up a large collection of cut chrysanthemums, showing these in vases; it was a bright display of Japanese, anemones, incurved, reflexed, and decorative varieties; silver Banksian medal. A large exhibit from Mr. H. B. May, Edmonton, contained some beautifully-grown plants of Begonia Gloire de Lorraine, a good collection of neat dracænas, and a collection of bouvardias freely flowered; silver-gilt Banksian medal.

Messrs. H. Cannell and Sons, Swanley, showed a splendid collection of decorative chrysanthemums, putting these up in large bunches and in vases. Miss Harvey, white; Mrs. Filkens, golden; Framfield Beauty, single, crimson; Sam Casswell, rose; Pride of Ryecroft, yellow; Sécrétaire Rivoire, yellow; Earlswood Beauty, cream; and Alice Carter, scarlet and gold, were among the most notable in a very fine lot; silver Flora medal. A splendid group of poinsettias, the plants all well furnished with foliage and fine bracts, was staged by Messrs. T. Cripps and Son, Tunbridge Wells; this was greatly admired, and gained a silver Flora medal. Mr. W. Neville, gardener to F. W. Flight, Esq., Cornstiles, Winchester, put up a grand lot of four dozen incurved chrysanthemums, these including fine specimens of Major Bonaffon, Ma Perfection, Globe d'Or, Laurence Zede, C. H. Curtis, Topaze Orientale, Lord Rosebery, Madame Ferlat, and Princess of Wales; silver Banksian medal. Mr. W. H. Witty, Nunhead Cemetery, showed the pretty decorative variety called Golden Shower, like an extravagant form of Alice Carter. Ornithogalum lacteum was shown by Mr. Bain, gardener to Sir Trevor Lawrence, Bart., Dorking; it has spikes of pure white flowers, and is useful for winter flowering. Messrs. J. Veitch and Sons, Chelsea, staged a handsome lot of plants of their winter-flowering begonias. The varieties shown were Ensign, rosy carmine; Winter Cheer, rich carmine, quite a scarlet hue under artificial light; and Myra, a paler and more rosy colour than Winter Cheer, but equally acceptable and useful for the embellishment of conservatory or greenhouse during winter. Mr. Gilbert Christy, Lime Street, showed a Brazilian species of begonia, named B. venosa, with thick leafage, dark shining green, but almost covered with a furry tomentum, the under sides are densely furred; flowers small and white; the stems are clothed with large imbricating, transparent bract-like scales. Mr. W. Bull, King's Road, Chelsea, showed a charming new epiphyllum, having very pretty and delicate lilac-tinted flowers; this was named E. truncatum Princess, and gained a first-class certificate. Mr. A. Kingsmill, Harrow Weald, sent fruiting sprays of Skimmia Foremanni and Vitis heterophylla humulifolia.

ORCHIDS.

Not many orchids were on view; doubtless the sudden arrival of cold weather had kept them at home. Mr. G. Day, gardener to H. S. Simonds, Esq., Woodthorpe, Southend Road, showed a pretty little group of orchids, including fine examples of Oncidium varicosum, Odontoglossum grande, Cymbidium Traceyanum, Cattleya labiata, Angræcum Leonis, several cypripediums, and other odontoglossums; a bronze Banksian medal was awarded. Mr. Whiffen, gardener to J. Bradshaw, Esq., The Grange, Southgate, showed a nice group of orchids, the central specimen being a large Cymbidium Winnianum, with nine good spikes that were staked rigidly erect; some first-rate cattleyas, including C. Mantini, and Cymbidium Traceyanum with a dozen fine blooms were shown; silver Banksian medal. Mr. H. Holah, Richmond, showed a pretty form of Lycaste Skinneri having pretty creamy sepals, it was named Holah's var. Mr. J. Medcalf, gardener to J. L. Godlee, Esq., Walthamstow, sent a pretty seedling cypripedium, but neither name nor parentage was given.

Oncidium pectorale, with brown-barred sepals and a yellow lip, was shown by Messrs. J. Veitch and Sons, Chelsea; it is from the Organ Mountains, Brazil. Mr. W. H. White, gardener to Sir Trevor Lawrence, Bart., Dorking, showed grand spikes of Calanthe labrosier with creamy white flowers, C. Bryan, the curious Cirrhopetalum appendiculatum, a new species; Dendrobium formosum Lowi, a hybrid between the species indicated and having a dull orange centre to the lip; some good cypripediums were also shown, including C. Argo-Morganiæ, referred to in another column.

FRUIT AND VEGETABLE COMMITTEE.

A very few exhibits came before this body. Mr. Lewis Dunbar, Hemel Hempstead, showed ten large specimens of Ne Plus Ultra onions. Messrs. Williams, Tallack, Hartland, and Ward sent apples for the committee's opinion, but only one gained any award, and this was named Ballinora, a large Blenheim like fruit from Messrs. Hartland and Son, Cork, which gained an award of merit; it has a bright crimson scarlet colour.

YORK CHRYSANTHEMUM SHOW, November 16, 17, and 18.

THE exhibition held under the auspices of the Ancient Society of York Florists on the above dates was more variable than is customary, yet the display produced was, as a whole, worthy of a history of at least one hundred and fifty years, and a city which for many years has been an important centre of horticultural activity. Specimen plants were hardly equal to those contributed to the more recent exhibitions, and in both of the classes for groups there was a decided falling off in numbers, but those in competition were highly meritorious. As a set-off the classes for cut blooms were well filled, and contained some of the finest collections that have come under our notice this season, whilst fruit and vegetables were very strongly represented, both as regards numbers and quality.

CUT BLOOMS constituted the great feature of the exhibition, and proved immensely attractive to the general body of visitors. As the society allows exhibitors free choice in the matter of the size of the stands for Japanese, a considerable proportion of the blooms of these were staged on boards of the size fixed for incurved, and in consequence were much too crowded to admit of the display of their characteristics. There was a brisk competition in the class for thirty-six blooms, to comprise equal numbers of incurved and Japanese, in which the premier award consisted of a challenge vase of the value of £20 and £10 in cash. Mr. J. P. Leadbetter, gardener to T. Wilson, Esq., Tranby Croft Hall, occupied the post of honour with finely-developed blooms, those of the Japanese being especially good. The incurved varieties were: Duchess of Fife, Hero of Stoke Newington (2), Golden Empress (2), Miss Violet Tomlin, Princess of Wales (2), Queen of England, Miss Haggas, Lucy Kendall, Ma Perfection (2), Leonard Payne, Madame Ferlat, Bonnie Dundee, and Mrs. R. C. Kingston. The Japanese were Miss Nellie Pockett, Australie, Mrs. J. Lewis, Viviand Morel, Mrs. F. A. Bevan, Modesto, Pride of Madford, Lady Ridgeway, E. Molyneux (2), Charles Davis, Madame Carnot (2), International, Mrs. G. W. Palmer, Edith Tabor, Lady Hanham, and Thomas Wilkins. Mr. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, was a good second, his incurved being of high quality. Mr. Folkard, gardener to Sir J. R. Walker, Bart., Sand Hutton, York, who was third, also had a collection of great excellence. The exhibitor last named obtained premier honours in the class for eighteen incurved with splendidly-developed blooms of Lord Alcester, Mrs. R. C. Kingston (2), Duchess of Fife (2), Golden Empress (2), J. Agate (2), Queen of England, Baron Hirsch, Madame Darrier, C. H. Curtis (2), Lady Isabel, L. Payne, Perle Dauphinoise, and Mrs. Coleman. Mr. J. H. Goodacre was second with a meritorious collection. There was a keen competition in the class for twelve incurved, and here also Mr. Folkard and Mr. Goodacre were first and second respectively.

The class for eighteen Japanese was noteworthy for the excellence of the blooms, and the first prize stand from Mr. D. Williams, gardener to the Earl of Feversham, Duncombe Park, Helmsley, contained some of the finest blooms exhibited this season, but the stand was not large enough to display them to the best advantage. The varieties were Eva Knowles, Mons. Panckoucke, Simplicity, Robert Powell, G. J. Warren, Mons. Chenon de Leche, Mrs. H. Payne, Mrs. J. Lewis, Good Gracious, Mrs. G. W. Palmer, Mutual Friend, N.C.S. Jubilee, Edith Tabor, Viviand Morel, and Phœbus. Mr. G. Picker, gardener to F. R. Pease, Esq., Hesslewood, Hull, was second with finely-developed blooms. The first and second awards for twelve Japanese were made in favour of Mr. Williams and Mr. Picker, both of whom staged capital blooms. Mr. Williams was first for six blooms of any white variety with Madame Carnot in a high state of development, for six blooms of any yellow variety with Edith Tabor, and for the same number of blooms of a golden yellow variety with Lord Brooke. Japanese anemones were staged in excellent form, and Mr. W. Ward, gardener to G. H. Anderton, Esq., Kilpin Lodge, Howden, was successful in obtaining premier honours. The contributions to the class for twelve sprays of chrysanthemums and for baskets were numerous and produced an attractive display, the winners of the first prize in the respective classes being Messrs. Theakston and Son and Messrs. R. Simpson and Son. Mr. R. Agar, gardener to Major Lumley, Cliffe Villa, Clifton, York, was successful in winning the first prize, which consisted of a challenge vase of the value of £10 and £3 in cash, for eighteen blooms with a collection evincing high-class cultural skill. Mr. R. Lawson, who was second, also had finely-developed blooms.

GROUPS were less numerous than usual, and the magnificent hall in which the plants are shown was hardly so attractive as last year. The arrangements in competition were, however, highly meritorious, and in the class for groups of chrysanthemums and foliage plants Mr. R. McIntosh, gardener to J. T. Hingston, Esq., Clifton, York, fully maintained the high reputation he enjoys for his cultural skill and taste by securing the premier award. The arrangement, briefly stated, consisted of a sloping and somewhat irregular bank of chrysanthemums, interspersed with fine foliage plants, and, although the whole of the blooms were of exhibition quality, the effect was very light and pleasing. Mr. J. McIntyre, gardener to Mrs. Gurney Pease, Darlington, was a capital second with a tasteful arrangement. The winner of the first prize in the class for collections of chrysanthemums, in which cultural excellence was the test of merit, was Mr. J. W. Hields, who had a magnificent group. Mr. Everard, gardener to Mrs. Gutch, Holgate, York, was, as usual, highly successful in the plant classes, as indicated by the fact that he was first for four incurved, four Japanese, and for single specimens of Japanese, incurved and reflexed, with splendidly-flowered, naturally-trained specimens. Mr. S. Hardcastle and Lord Herries were the most successful exhibitors in the classes for specimen pompons, and the last-named obtained premier honours for specimens of single varieties.

FRUIT formed as usual an attractive feature, the grapes being especially meritorious. Mr. J. Tullett, gardener to Lord Barnard, Raby Castle, was first for six bunches of grapes, staging two remarkably fine clusters of Barbarossa weighing ten pounds each, and finely-finished clusters of Alicante and Muscat of Alexandria; Mr. Goodacre and Mr. J. Allsop were second and third. The last-named obtained premier honours in the classes for single dishes of white and black grapes, staging well-finished clusters of Muscat of Alexandria and Alicante. Mr. J. McIndoe was successful in occupying the first place in the great class for thirty-six dishes of apples and pears with excellent examples; Mr. Goodacre, who was second, also had a collection evincing cultural skill of a high order. The Rev. Gordon Salmon, Mr. J. McIndoe, and Mr. J. Allsop were the most successful of the exhibitors in the other classes for collections of apples and pears.

MISCELLANEOUS CONTRIBUTIONS included a large and extremely beautiful collection of cyclamen, remarkable alike for the high quality of the strain and the cultural skill evinced, from Messrs. Sutton and Sons, and the firm also contributed well-grown examples of Primula obconica and their new cucumber, Every Day. A gold medal was awarded the firm, and Messrs. J. Backhouse and Son received a similar distinction for a magnificent collection of apples. Messrs. Clibran and Son contributed an excellent collection of chrysanthemums.

EDINBURGH, November 17, 18, and 19.

NEVER before has such a magnificent autumn show been held under the auspices of the Scottish Horticultural Association as that here recorded in the spacious Waverley Market. Nowhere in the United Kingdom could be seen such an array of blooms, and nowhere is a similar attempt made to show off the chrysanthemum in its true decorative character as here, where the principal prizes are offered for the blooms staged in vases in triplets accompanied with their own foliage.

In the plant classes, too, there was a marked improvement in the quality of the exhibits; fruit, too, was satisfactory. The only falling off was in the vegetable section; here the entries were fewer, but the produce was equal to any previously seen in point of quality.

During the whole of the three days the show was crowded with visitors; no doubt the spirited policy of the executive in engaging the fine band of the Grenadiers was in some measure answerable for the great influx of visitors. The arrangements were, as usual, of that perfect order which characterises all the meetings of this society. Mr. R. B. Laird, as usual, had the matter well in hand; if he is not a model secretary it would be difficult to find one.

CUT BLOOMS.

Cut blooms were the feature of the show, therefore demand a first notice. No less than seventeen classes were provided for blooms arranged in vases in this section. The leading class was that for twenty vases of chrysanthemums in twenty varieties, three blooms of each, with foliage; a piece of plate value £20 and £15 was the leading prize, with £20 for the second, and £12 for the third. Six competed, making the finest display seen this season. Mr. T. Lunt, gardener to A. Stirling, Esq., Keir, Dunblane, was an easy winner of the premier award with a magnificent exhibit in every respect. The varieties were Oceana, Louise, Lady Ridgeway, Phœbus, Mrs. Weekes, J. Bidencope, Australian Gold, Mrs. G. W. Palmer, Australie, Madame G. Henry, M. Chenon de Leche, Mrs. C. H. Payne, Mdlle. de Galbert, Pride of Madford, M. Hoste, Mrs. J. Lewis, Eva Knowles, Madame M. Ricoud, and Simplicity. Mr. D. Nicoll, gardener to J. W. Bell, Esq., Rossie, Forgandenny, was a capital second, staging grand clusters of Madame Carnot, Mrs. Weekes, Mutual Friend, Modesto, Edith Tabor, and Australie; Mr. Haggart, gardener to the Hon. Lucius O'Brien, Moor Park, Ludlow, third; Mr. Berisant, Castle Huntly, fourth. The Scottish Challenge Cup, value £25, and £10 in cash, was offered as the leading prize for twelve Japanese in vases of three blooms each, distinct, and for which there was brisk competition. Mr. R. Addison Blackhouse, Skelmorlie, was the first prize-taker, staging a grand lot of blooms, accompanied with capital foliage: M. Chenon de Leche, Pride of Exmouth, Phœbus, Viviand Morel, Mrs. D. Dewar, Edith Tabor, M. Gruyer, Lady Byron, Lady Esther Smith, Charles Davis, Lady Hanham, and M. Panckoucke. Mr. D. Nicoll again occupies the second place with grand examples of Mrs. Weekes, Madame Carnot, Simplicity, and Madame G. Henry; Mr. J. Bird, Raehills, Lockerbie, third; Mr. A. Kirk, Alloa, fourth. A splendid class is that for three vases of decorative varieties, not disbudded, and for which eighteen competed, making an imposing and interesting display. Mr. A. C. Cameron, Binrock, Dundee, won the premier award with an almost faultless exhibit of Source d'Or, Mrs. A. Kirke, and Yellow Lacroix arranged with suitable foliage; Mr. G. Chaplin second, and Mr. A. Linton, Glenormistie Lodge, third. For one vase, single-flowered varieties, an exceedingly pretty display was made by the seven competitors. Mr. A. Cameron again secured the leading position with well-grown blooms of Mary Anderson and Miss A. Houlden; Mr. J. Holmes, Winton Castle, second; and Mr. J. Robertson, Beechleigh, Bonnyrigg, third. For four vases, each containing six Japanese blooms, there was a stiff competition. Mr. D. Mackay, Kingston Grange, was placed first with a deserving exhibit of fully-developed blooms of popular varieties; Mr. R. Whannell, The Drum, Gilmerton, second; Mr. T. Dale, Aikenhead, Cathcart, third. Keen competition was experienced also in the class for twelve Japanese blooms in one vase, Messrs. Addison, Kirk, and Cameron winning in the order here given. For one vase of six Japanese blooms any one variety Mr. J. Bird won with capital examples of Viviand Morel; Mr. J. Clark, Bannerfield, second, with M. Chenon de Leche. Prizes were offered for six blooms each of specified varieties in vases with their own foliage, which proved interesting. Mr. Addison won with marvellous examples of C. Davis, Duchess of York, E. Molyneux, and President Borel, in all cases staging representative blooms of each variety. Mr. J. Day, Galloway House, Garlieston, won with Edith Tabor in faultless condition. Mr. Armstrong, Musselburgh, with splendid examples of Mutual Friend, secured the leading position for that variety.

For blooms staged on the ordinary stands there were many classes provided. The principal one was for thirty-six Japanese distinct, and for which a first prize of £15 was offered, which induced seven to compete. Mr. T. Lunt again demonstrated the superiority of his blooms by easily securing the coveted award with really fine examples, of which Mrs. Weekes, J. Bidencope, Madame M. Ricoud, Mutual Friend, Matthew Hodgson, Australie, Madame Rousseau, Simplicity, John Seward, Mrs. F. A. Bevan, and Oceana were the best. Mr. Addison, with smaller examples of popular varieties, was second; Mr. J. Martin, Corndean Hall, Winchcombe, third.

Mr. Lunt followed up his former success by securing the leading position for twelve Japanese amongst thirteen competitors. Oceana, Dorothy Seward, Rose Wynne, John Seward, M. Hoste, and Simplicity were the most conspicuous among them, all of which were good. Messrs. Addison and Day followed uncomfortably close for the remaining prizes. Mr. J. H. Cumming, Grantully Castle, won for six Japanese with a commendable exhibit.

Incurved varieties were but moderately staged; the best were those in the class for twelve varieties coming from Mr. J. Martin; these were of medium size and fairly well finished. Mr. A. Cameron won for six, and Mr. Martin won also for six blooms of C. H. Curtis with neat examples. Mr. J. Henderson, Elleray, Windermere, staged J. Agate in the class for six, any one variety, and secured the premier award. Mr. T. Dale second with the same variety.

PLANTS.

These were numerous, the quality a distinct improvement upon former years, owing, no doubt, to the increase in the value of the prizes. For six specimen large-flowered varieties £10 was offered for the leading award; this was secured Mr. J. Thomson, Preston Grange, Prestonpans, in an easy manner with huge examples of J. Shrimpton and La Triomphante, each carrying fully one hundred and fifty blooms, not too formally trained; Mr. D. Cavannagh, St. Edward's, Murrayfield, second; Mr. J. Wood, Dunmore Park, Larbert, third. Mr. J. Thomson also secured the leading award for four Japanese, and for single specimen Japanese. Mr. W. Pulman, Holywood, Colinton Road, won for four pompons, staging freely-flowered examples. The best specimen any white-flowered variety was staged by Mr. J. Macpherson, Dunisla House, Edinburgh, and was creditable.

Vases of vine leaves, bouquets, and other floral ornaments were numerous and good. The Misses Todd appeared to be almost invincible by the number of prizes they secured, in all instances staging really tasteful exhibits. Mr. A. E. Todd, Stoneybank, Musselburgh, won the leading prize for a circular table of cut flowers and plants with an exhibit that showed much taste in the harmonising of the material employed. Fruit and vegetables were freely contributed, and of the best quality. Space, however, forbids any further details.

NON-COMPETITIVE EXHIBITS.

These were not numerous, but of an interesting character. Mr. H. J. Jones, Ryecroft Nurseries, Lewisham, had a table of interest. In the centre were three dozen grandly-flowered plants of Begonia Gloire de la Reine, flanked with palms and ferns; along the front were arranged about twenty dozen chrysanthemum blooms, consisting of the leading varieties, of which R. Hooper Pearson, H. J. Jones, J. Chamberlain (Japanese), Kate Broomhead and Hanwell Glory (incurved) received first class certificates. Messrs. Dobbie, Rothesay, had a pleasing exhibit of decorative chrysanthemums, apples, and potatos; Mr. Thomas Fortune, 17, Queen's Ferry Street, Edinburgh, a grand assortment of subjects suitable for floral decoration; Mr. John Downie, florist, Edinburgh, had a similar exhibit of perhaps greater merit; Messrs. G. Bunyard, Maidstone, an excellent collection of apples.

WINCHESTER, November 15 and 16.

THE sixteenth autumn exhibition was held in the Guildhall, and was in every way a decided success. The competition was keen, and the exhibits well up to the average in point of quality. The arrangements were of that perfect order characteristic of shows in this city. Mr. C. Shenton is a courteous as well as a practical hon. secretary, having all the arrangements well in hand.

Cut blooms formed the most important feature of the show, staged as they were in large numbers and of such excellent quality. The principal class was that for forty-eight distinct, half to be Japanese and the remainder incurved. For the challenge cup and £8 offered as first prize there were five competitors, making a grand display, Mr. Neville, gardener to F. W. Flight, Esq., Twyford, Winchester, winning easily with a meritorious exhibit of both sections. The incurved varieties were simply magnificent, and equal to any seen this season. The names were: Ernest Cannell, Mrs. R. C. Kingston, Miss V. Foster, C. H. Curtis, Ma Perfection, Topaze Orientale, Madame Ferlat, Lady Isabel, Mrs. N. Molyneux, Globe d'Or, Princess of Wales, R. Petfield, Queen of England, Austin Cannell, Mrs. Coleman, G. Haigh, V. Tomlin, D. Foster, Madame Darrier, M. Martignac, Lord Wolseley, Miss M. A. Haggas, and Lucy Kendall.

Japanese—Madame Carnot, Colonel W. B. Smith, Lady Hanham, Sec. Fierens, Madame M. Ricoud, Mrs. C. Blick, Mary Molyneux, Madame D. Tallandier, Miss E. Addison, Phœbus, Australie, Rose Wynne, Capt. L. Chaure, G. Roberts, E. Tabor, P. Borel, Beauté de Grenobloise, Master H. Tucker, Australian Gold, J. Chamberlain, Pride of Exmouth, Eva Knowles, and Mutual Friend. Mr. W. G. Prewett, gardener to C. A. Pearson, Esq., Frensham Place, Farnham, was a good second with Japanese and neat incurved, Lady Ridgeway, J. Wilkins, and Madame Carnot being noteworthy in the Japanese section; Mr. W. G. Adams, Clarendon Road, Southsea, was third.

For twenty-four Japanese, distinct, Mr. J. Wasley, gardener to F. B. Taylor, Esq., Sherfield Manor, Basingstoke, won easily with blooms well up to the average in point of quality; especially good were Australie, Madame Carnot, Phœbus, Mrs. W. H. Lees, M. Chenon de Leche, Pride of Madford, Milano, N.C.S. Jubilee, Australian Gold, and Mutual Friend; Mr. Neville, second; and Mr. Bowerman, gardener to Mrs. C. Hoare, Hackwood Park, Basingstoke, third. Mr. Neville won premier place for twelve incurved varieties with even, neat blooms of Mrs. R. C. Kingston, C. H. Curtis, Ma Perfection, Topaze Orientale, R. Petfield, Madame Ferlat, V. Foster, Princess of Wales, and Miss M. A. Haggas; Mr. C. White, Southsea, second. For twelve incurved, four varieties, three blooms of each, there was brisk competition and good exhibits; Messrs. Neville and White were placed first and second respectively with thoroughly representative blooms of Ma Perfection, C. H. Curtis, Princess of Wales, and Mrs. R. C. Kingston. For twelve white flowered Japanese in four varieties Mr. J. Wasley won the premier award with commendable examples of Mutual Friend, Madame Carnot, Simplicity, and Elsie Teichmann; Mr. Neville, second; Mr. G. Best, gardener to F. Leyland, Esq., The Vyne, Basingstoke, third. For a similar number of yellow or bronze-flowered varieties Mr. Wasley won the leading position with thoroughly representative blooms of popular varieties, as also he did for a similar number of red, crimson red, and gold. Mr. Bowerman was second in the first-named class, Mr. Neville occupying a like honour in the latter class.

Plants were numerous, and of much excellence. For a group of chrysanthemums, with an edging of foliage plants admitted, there were four competitors, and, as all were creditable, they made an imposing display. Mr. G. H. Street, gardener to Rev. Dr. Fearon, The College, Winchester, was distinctly the premier prize-taker with dwarf plants, well clothed with foliage and carrying grand blooms. Mr. T. Butcher, gardener to Rev. H. E Moberley, St. Michael's Rectory, Winchester, was second; Mr. G. Newman, gardener to Captain Gaussen, Twyford Lodge, third. Prizes were offered for eight plants suitable for conservatory decoration, and which produced keen competition, so good were the exhibits and close in point of merit. Mr. G. Cousins, gardener to E. H. Buckland, Esq., King's Mead, Winchester, was first prize-taker, with plants carrying good foliage and blooms; Mr. H. Grigg, gardener to the Rev. Moorsom, Holyrood, Winchester, second. For six plants, any white-flowered variety, Mr. Grigg won the pride of place, with grand examples of popular suitable varieties; this exhibitor secured a similar position for the same number of yellow-flowered varieties. Mr. Pittman, gardener to F. C. Starkey, Esq., Oakwood, Otterbourne, was a close second in each class. Standard trained plants made a great display. Mr. A. E. Taylor, Bar End, Winchester, won the premier award with a magnificent example of Madame M. Ricoud.

Groups of miscellaneous plants arranged for effect made a fine display, no less than eight competing. Mr. E. Carr, gardener to W. A. Gillett, Esq., Fair Oak Park, Bishopstoke, won the premier place, with a magnificent group, mainly consisting of orchids, palms, and ferns; Mr. Pittman a really creditable second; Mr. G. Newman, third. Primulas were grandly shown. For twelve Mr. T. [illegible], gardener to Mrs. C. Warner, Winchester, was first; and for six Mr. E. Long, gardener to C. F. Birch, Esq., Winchester, was the leading prize-taker. Table decoration was an interesting feature of the show, Mr. E. Carr winning the award with a choice assortment of orchids; Miss Nellie Owen, Basingstoke, second.

Fruit and vegetables made an imposing display. Mr. W. Mitchell, gardener to J. W. Fleming, Esq., Chilworth Manor, and Mr. T. Hall, gardener to Sir S. Montagu, Bart., M.P., South Stoneham, won the principal prizes in the former section. Mr. Bowerman won with a grand exhibit in the vegetable section.

Messrs. E. Hillier and Son staged a remarkably fine exhibit of apples and pears, not for competition; Messrs. Jarman and Co., Chard, a smaller exhibit of the same fruit. Mr. N. Molyneux, Rookesbury Park, Wickham, staged several seedling chrysanthemums, one of which—Jane Molyneux—a pure white Japanese, received a first-class certificate.

FOLKESTONE CHRYSANTHEMUM SOCIETY, November 14 and 15.

THE third annual exhibition of chrysanthemums at Folkestone was held under the auspices of the Folkestone Gardeners' Asssociation on the above dates, and was a marked advance upon the two previous gatherings, successful as they unquestionably were. The cut blooms, which were contributed in immense numbers, included some of the finest that have been exhibited this year, while the groups and pot plants were plentiful and highly meritorious. The show was held in the Pleasure Gardens, and the arrangements, under the direction of Mr. Wenham, Mr. J. Waite, and Mr. W. Walters, were remarkable for their completeness, and deserved much praise.

CUT BLOOMS were arranged in the spacious gymnasium, and produced a large and attractive display. The most important class was that for twenty-four distinct, to comprise equal numbers of incurved and Japanese, and it was satisfactory to find some seven or eight collections all more or less good. Here Mr. W. Foster, gardener to Ashley Dodd, Esq., Godinton, Ashford, was first with an even stand, in which the blooms were remarkable for their large size and superb finish. The incurved varieties were: Lady Isabel, John Fulford, John Lambert, Globe d'Or, Empress of India, Mrs. R. C. Kingston, C. H. Curtis, Miss D. Foster, Lord Alcester, Ma Perfection, and John Doughty; the Japanese varieties represented comprised Edith Tabor, J. Brooks, Pride of Exmouth, E. Molyneux, Mrs. J. Lewis, Duke of York, Phœbus, Lady Hanham, Mons. Chenon de Leche, Mons. D. Faillandre, G. J. Warren, and Australie. Mr. F. G. Foster, Brockhampton Nursery, Havant, was a close second, and Mr. H. Shoesmith a capital third. There were eight or nine entries in the class for twenty-four Japanese, and the several stands were very closely matched in point of merit. Mr. Foster was first with magnificent blooms of Australie, Souvenir de Madame Rosetta, Philipe Reviola, Charles Davis, Mons. Hoste, Mons. C. de Leche, Mrs. C. H. Payne, E. Molyneux, Swanley Giant, G. J. Warren, Graphic, Phœbus, Mr. J. Bidencope, Mrs. G. Carpenter, Surpasse Amiral, Mdlle. Rousseau, Oceana, Lady Hanham, Mrs. Mease, N.C.S. Jubilee, Madame Carnot, Etoile de Lyon, and Mrs. J. Lewis. Mr. H. Shoesmith followed closely for second place, and Mr. J. Bond was third. Of great excellence were the numerous stands contributed to the class for twelve incurved, and here Mr. D. Fairweather, gardener to J. A. Miller, Esq., Canterbury, occupied the post of honour with superbly-developed examples of well-known varieties; Mr. W. Tebay, Sevenoaks, was a capital second, and Mr. C. E. Wilkins, Wellington, Swanley Junction, was third with blooms in a high state of development. The corresponding class for twelve Japanese was equally satisfactory in point of numbers and quality, and the awards were made in favour of Mr. W. Tebay, Mr. F. G. Foster, and Mr. H. Shoesmith, while several stands were so good that the judges very properly commended them.

The class for twenty-four blooms, comprising equal numbers of incurved and Japanese varieties, in which the competition was limited to the gardeners' societies in Kent, was of much interest. The several stands were highly meritorious throughout, and in the result the Ashford Gardeners' Society obtained the premier position, while the Saltwood and Hollingbourne Societies were second and third. The gardeners' and local classes for cut blooms contained a large number of stands, which reflected much credit upon the respective exhibitors. The most successful of the competitors in these were Mr. W. Gambell, gardener to J. S. Vidler, Esq., Mountsfield, Rye; Mr. C. Payne, Elmshurst, Bickley Park; Mr. H. Hopper, Folkestone; Mr. A. Maycock, Mr. H. J. Weaham, and Mr. E S. Dunn, Cheriton.

GROUPS AND SPECIMEN PLANTS were arranged in the foyer of the theatre, and produced an exceptionally bright and pleasing effect. There was a strong competition in the class for groups of chrysanthemums occupying a space of fifty square feet, and the first prize group was one of the finest circular groups of chrysanthemums exhibited during the season. This was arrayed by Messrs. G. and A. Clark, Dover. Mr. H. J. Godden, gardener to Mrs. Walker, Hillside House, Hythe, and Mr. J. Rigden, Royal Pavilion Hotel, Folkestone, who were second and third respectively, had collections remarkable both for the high quality of the flowers and taste in arrangement; and Mr. Pilcher, Folkestone, whose group was highly commended, and Mr. R. P. Cox and Mr. T. Kennett, who received commendation, also deserve much praise for their respective arrangements. Messrs. G. and A. Clark were first also for a group of miscellaneous plants with a bright and tasteful arrangement; and Mr. J. Wilson, Folkestone, and Mr. G. Mount, also of that town, were second and third with groups differing materially in style but closely matched in merit. The specimen plants were trained in a more or less natural style, and with reference to them it is not possible to say more than that they contributed their full share to the attractions of the gathering. The principal exhibitors of these were Mr. T. Kennett, Mr. Hopper, Mr. H. J. Wenham, Mr. Clement Clark, and Mr. J. Wood.

MISCELLANEOUS contributions included a magnificent collection of hardy fruit from Mr. G. Mount and a beautiful table of floral arrangements from Mr. J. Wilson, a silver medal being awarded in each instance.

BRIGHTON, November 15 and 16.

THE sixteenth annual exhibition of chrysanthemums at Brighton was held in the spacious Dome and Corn Exchange, as usual, and great credit is due to Mr. J. Lewis and the managing committee generally for the way all arrangements were carried out. A much greater table space for fruit and cut flowers was secured by banishing the circular groups from the centre of the Corn Exchange, and limiting groups to semicircular form at the sides. If the first effect was not quite as good as formerly, visitors could get about among the exhibits with greater ease and comfort, and the increasing number of competitors made it absolutely necessary to provide more table space than in the past.

The silver cup presented by G. Sadler, Esq., for the finest of the semicircular groups was well won by Mr. G. Miles, Dyke Road Nursery, Brighton. The plants and flowers were well grown, and good use was made of small crotons, dracænas, and palms in the foreground. There was a great contrast between the first and second prize group, the latter being flat and the plants much crowded. This came from Mr. G. Simms, gardener to J. R. Cattle, Esq., Hill Crest, Brighton. It was a pretty group which won the Ryecroft silver medal and first prize for Mr. W. E. Anderson, but this appeared to lack a few taller plants at the back; Mr. E. Meachen was second with much better flowers, but too formal in arrangement. Standard plants were not up to their usual standard, but a few good dwarfs came from Mr. E. Meachen, who was placed first in both classes. There was a good specimen of Eva Knowles among these.

One of the best, and certainly the most admired of groups, came from Mr. H. Head, The Drive Nursery, Hove, who confined himself to chrysanthemums only, and had a number of excellent flowers, several of which surpassed those staged in the cut flower classes. Cyclamen were really good, and the twelve from Messrs. W. Miles and Co., Church Road, Hove, deserve special mention. The best six specimens came from Mr. T. Fairs, gardener to R. Clowes, Esq., Hassocks. There were some prettily-arranged vases of chrysanthemums only, five flowers only in each vase, and of given colours. Mr. H. Head, The Drive Nursery, was first, and Mr. M. Tourle, gardener to F. Barchard, Esq., a capital second. A stand of natural flowers and foliage is always well contested here. Mr. E. Meachen, Withdean, just succeeded in beating Mrs. Tourle, Little Horsted, who has frequently occupied the same position. This year the second prize stand wanted a little more colour in the centre. The special prize offered by Mr. H. Head for one vase of nine flowers was won by a very heavy and close arrangement from Mr. T. Fairs, Clayton Wickham, who also had some grandly grown Primula sinensis.

On the whole we did not think the cut blooms so good as usual. One of the most interesting classes was that for amateurs, the plants to be grown within three miles of the Pavilion, for which a challenge trophy is offered. Mr. G. Pigott, 37, Trafalgar Street, was successful here, and had an exceptionally good flower of International. Mr. J. Stredwick, St. Leonards, won for twenty-four Japanese, and Mr. G. Duncan, gardener to C. J. Lucas, Esq., Horsham, was ahead for twelve Japanese, but these were rather loose flowers. There was very strong competition for a table of chrysanthemums and foliage plants, the piece of plate being secured by Mr. G. Miles, Dyke Road Nursery, for a table of well-grown specimens, but many good flowers too much crowded among the palms. We liked the second prize table best as regards arrangement, but the flowers here were not up to those from Mr. Miles. The specimen blooms were not over good. Mr. Harris, gardener to Colonel Henty, Arundel, had the best in Madame Carnot and C. H. Curtis, closely followed by Mr. J. Hickson, gardener to F. Slater, Esq., Newick, Bonnie Dundee being very good.

The best non-competitive exhibit came from Messrs. Balchin and Sons, who surpassed their previous efforts, and had a grand lot of bouquets, vases, and plants. The gold medal was awarded here. That roses were still with us in the open was amply proved by the quantity staged by Mr. G. W. Piper, Uckfield. Fruit was not so good or numerous as in most seasons.

NATIONAL CHRYSANTHEMUM SOCIETY.

AT the meeting of the Floral Committee held on Monday last, with Mr. C. Harman Payne in the chair, there was a considerable number of novelties, the most noteworthy collection being contributed by Mr. H. Weeks, of Thrumpton Hall, Derby, who was awarded a silver medal; Mr. W. J. Godfrey, Messrs. Cannell and Sons, Mr. H. J. Jones, Mr. Forbes, Mr. N. Molyneux, and Mr. Motty, the latter contributing some interesting novelties from Japan. The following certificates were awarded: To Mr. H Weeks for *Mrs. Barkley*, a superb Japanese reflexed, with broad, stout florets, massive, and of fine form, colour rich lilac purple; and for *Edith Dashwood*, an exceedingly beautiful Japanese, the flowers of the largest size, refined, and of a soft flesh pink; in form the blooms remind one of Madame Carnot. To Mr. Forbes for *Floris*, a beautiful single variety, the blooms large, with long florets, and of a pleasing pink hue; and *Victoria*, a charming variety, with large blooms, elegant in aspect, and of a pale primrose colour.

MARKETS.

Covent Garden.

THE moderate supplies of fruit and vegetables meet a brisk demand, and prices are firm all round.

FRUIT.—English apples, 3s. to 9s. per bushel; Nova Scotian, 14s. to 28s. per barrel; French pears, 3s. to 5s. per box; Californian, 4s. 6d. to 9s. per case; English grapes, 9d. to 1s. 6d.; Channel Islands, 6d. to 1s. per lb.; Valencia, 10s. to 18s. per barrel; Murcia, 4s. to 7s. per box; bananas, 5s. to 9s. per bunch; pineapples, 1s. 6d. to 4s. each; pomegranates, 4s. to 6s. 6d. per case; Jaffa oranges, 9s. to 11s.; Jamaica, 8s. to 10s. per box; Murcia, 5s. to 7s. per case; English walnuts, 3s. 6d. to 4s. 6d. per bushel; lemons, 15s. to 25s. per box.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; chrysanthemums, white and yellow, 1s. to 3s.; eucharis, 2s. to 4s.; gardenias, 1s. to 2s. 6d.; Lilium Harrisii, 5s. to 8s.; tea roses, 6d. to 1s.; pink roses, 3s. to 4s.; red roses, 1s. to 2s.; cattleyas, 5s. to 9s.; Odontoglossum crispum, 2s. to 4s.; and tuberoses, 3d. to 9d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; chrysanthemums, 6s. to 9s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 4s. to 6s. per dozen bunches; stephanotis, 1s. to 1s. 6d.; lily of the valley, 1s. to 2s.; and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—English tomatos, 3s. 6d. to 6s.; Channel Islands, 3s. to 3s. 6d. per 12 lb.; Bordeaux, 1s. 3d. to 1s. 9d. per box; English onions, 5s. to 6s. per cwt.; Valencia, 5s. 9d. to 7s. per case; Dutch, 3s. 6d. to 4s. per bag; seakale, 9d. to 1s. per punnet; celery, 6s. to 12s. per dozen rolls; endive, 1s. to 1s. 3d.; cucumbers, 2s. 6d. to 4s.; lettuce, 9d to 1s. 3d per dozen; turnips, 2s. 6d. to 3s. 6d.; carrots, 2s. 6d. to 3s.; and parsley, 1s 6d. to 2s. per dozen bunches; cabbages, 4s. to 7s.; cauliflowers, 4s. 6d. to 8s. 6d. per tally; Brussels sprouts, 2s. 6d. to 3s. per half-sieve; eschallots, 8s. to 10s. per cwt.; potatos, 55s. to 90s. per ton.

Borough Potato Market.

Owing to large supplies from Scotland and Germany prices have been slightly lower, but the past few cold days have tended to increase the demand. Beauty of Hebron, Snowdrops, and Up to Date 75s. to 85s. per ton; White Hebron, Early Puritan, Bruce Magnum, Sutton's Early Regent, Reading Giant, and Imperators, 70s.; Blacklands, 60s. to 65s.; Scottish Abundance, Bruce, and Main Crop, 70s. to 75s. per ton; Germans, 2s. 10½d. to 3s. per cwt.

DISOBEDIENCE IN THE ARMY is looked upon as one of the gravest crimes a soldier can be guilty of, and in the past it has often been punished with death. The fate of a battle and the lives of thousands of men, let alone our national honour, have often been dependent upon the prompt carrying out of what might have seemed a trivial order. Discipline without good health, however, would be like a house without a foundation; therefore great pains are taken to keep our fighting men free from disease. Holloway's Pills have always been found an excellent medicine for this purpose, as, in addition to cleansing the blood, they invigorate and give tone to the system.—[ADVT.]

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Club-rooted Beans and Brussels Sprouts.—J. W., Aberystwyth: The Brussels sprouts are suffering from a very bad attack of club-root (*Plasmodiophora brassicæ*), and this cannot be cured in the crop now suffering. To prevent a recurrence of the disease give the land a strong dressing of fresh lime, or of gas lime if this is obtainable, and allow it to remain roughly turned up or ridged during the whole of the winter. The next crop or two should not be a brassica one. With regard to the French beans we should be glad of further information as early as possible, as the case is rather different, and presents unusual features.

Seedling Apple.—W. P., Stebbing: The apple sent is of fair quality, but it does not present a very handsome or taking appearance; consequently it would unduly raise your hopes were we to suggest that you should propagate it freely for distribution. By all means retain the specimen in your garden, as it crops well and resists blight, but there are already so many first-class varieties that prove meritorious in almost all parts of the country that the multiplication of a variety of less value is not advisable; indeed, it is to be discouraged. Graft a really good apple, say Ribston Pippin, upon one branch of your vigorous seedling, note the results, and compare the quality of the fruits.

Renovating Old Cherry Orchard.—C. T. R., Bucks: It is highly probable that a good deal of thinning is necessary, that some amount of feeding is needed, and also that the soil is lacking in lime, which is very necessary for the perfecting of stone fruits, and some, such as the cherry, like an abundance of lime; indeed, we have seen fine orchards of cherries growing in the débris and rubbish from lime quarries and kilns. We cannot, however, give a satisfactory answer to your query without some further particulars as to soil, cultivation, number of trees per acre, and their size, situation of the orchard, &c. If you will supply these we will give you the best advice we can.

Vines in Old Borders.—G. F., Driffield: Under the circumstances you cannot do better than remove a part of the border, carefully disentangling the roots and keeping them moist between mats until they can be relaid. In all probability you will find the drainage needs putting right, and this is work that must be done thoroughly. Cut back any strong, coarse roots to a point where they branch, and, of course, sever any that may have gone beyond the limits of the border; something, too, might be done by the use of tiles or slates to prevent any quantity of roots from straying, but nothing less than cement or concrete will absolutely confine them. We should advise the lifting of a half or a third of the border length this season, as this will enable you to use the largest possible proportion of new material for relaying the roots in, and also the vines will show the advantage of such treatment. If the lower soil in the border is at all sour or unfertile it must be rejected, and, as you are likely to find it so, you will appreciate the importance of doing the work piecemeal. A cartload or two of loam for the upper layers of soil, and wherein the roots will be relaid, will not prove an extravagant item, and doubtless you can manage this, whereas to do the whole border at once would, as you say, be too great an expense. Use bone-meal and lime rubble by all means, but not overmuch of the former; and be careful when the work is done—and it should be done immediately—that the cold rains and snows of winter are kept off it by means of shutters, lights, &c. During the coming season we suggest that you put aside all the turf edgings and anything turfy or loamy that you can obtain, with a view to its use next autumn on another portion of the border.

Names of Plants.—I., Cheshire: 1, Ophiopogon Jaburan; 2, Euonymus japonicus albo marginatus; 3, Begonia maculata; 4, Dieffenbachia Baraquiniana; 5, not recognised; 6, Nerine crispa.

L. B., Windsor: Hibbertia dentata.

Names of Fruits.—F. H. B., Co. Carlow: 1, Stirling Castle; 2, London Pippin; 3, Ecklinville Seedling; 4, Blenheim Pippin; 5, not recognised; 6, King of the Pippins.

H. L. C., Coventry: 1, Mère de Ménage; 2, Dumelow's Seedling; 3, Old Hawthornden; 4, Minchull Crab.

The mean reading of the Barometer during the week at Greenwich was 30·07 inches, and that of the Thermometer 48°·0, the latter being 5°·6 above the week's average in the 50 years 1841—90. The direction of the wind was variable, the horizontal movement of the air being 42 per cent. below the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 10·7 hours. The measured rainfall amounted to 0·02 of an inch.

ENGAGEMENTS FOR THE ENSUING WEEK.

MEETINGS.

MONDAY, NOVEMBER 28.—General Committee Meeting of the National Chrysanthemum Society.

WEDNESDAY, NOVEMBER 30.—Annual Dinner of the National Chrysanthemum Society, Holborn Restaurant; Sir Albert Kaye Rollit, M.P., will take the chair at 6.30 p.m.

TRADE OPINION of "LE FRUITIER."

28 TONS

To one Customer who grows for profit.

"The Vineries, Gillingham, Kent.

"Dear Sirs,—Since 1895 I find I shall have used 28 tons of your '**LE FRUITIER**,' and my order for this season being the largest I have given you is the best evidence of my opinion that I can offer of your '**LE FRUITIER**.'—Yours truly,

"GEORGE FEATHERBY.

"To Messrs. Wm. Wood and Son (Ltd.), Wood Green."

THE MARKET GROWERS' FAVOURITE.

Test Experiments at a Private Establishment.

BEST RESULTS

in competition with three other well-known Vine Manures.

"Mr. McFARLANE, Head Gardener to HARVEY DU CROS, Esq., at Cornbury Park, Oxfordshire (who has special facilities for conducting such experiments), has thoroughly tested our '**LE FRUITIER**' against three other well-known Vine Manures, under exactly the same conditions, and conclusively proved (as so many others have done) that no other Fertiliser will give such good results as '**LE FRUITIER**.'"

The Exhibitors' **PRIZE WINNER.**

CARRIAGE PAID EVERYWHERE.

NEW CHRYSANTHEMUMS.

EXTRAORDINARY SUCCESS.

NEVER in the annals of Chrysanthemum History has such phenomenal success been achieved by any raiser of New Seedlings as by Mr. H. WEEKS, in the sensational productions exhibited by him from time to time this season before the Floral Committee.

When it is remembered that in the small collection of a private garden only a very limited number of plants can be grown of each variety, and the difficulty therefore of securing the required number of blooms stipulated for by the N.C. Society on a given day, it is indeed remarkable that no less than Seven First-class Certificates should be awarded. Other varieties equally as good had to forego their candidature from the simple fact that only two flowers could be ready at the same time, or else the total number of Certificates would have been larger. This is indeed success. I have the honour to announce that I have secured the entire stock of all these magnificent Novelties, and shall distribute same together with a few of my own, and some of the finest Australian Seedlings ever introduced.

LIST OF SUCCESSES
IN THIS PAPER
NEXT WEEK.

NEW TEA-SCENTED ROSE "SUNRISE,"

Illustrated and Described in the "Gardeners' Magazine" for November 26.

THIS is one of the freest growing and most constant bloomers we have. In fact, it has never been out of flower, under glass, during the six years we have grown it; and is also a good bedder. An Award of Merit was given by the Royal Horticultural Society on October 25 of the present year. The following Extracts from the Gardening Press speak for themselves. Orders have already been received from prominent Rosarians, and we anticipate a large demand.

Extracts concerning Rose "Sunrise."

The Gardeners' Magazine, October 29.

"Mr. G. W. Piper, Uckfield, showed a pretty coppery-buff Tea scented rose named 'Sunrise,' a new form of great beauty."

The Journal of Horticulture, October 29, 1898.

"ROSE 'SUNRISE' (G. W. Piper).—A lovely Tea-scented variety that is deliciously fragrant. The under portion buff-apricot, and the outer side bright cerise (award of merit).'

The Gardeners' Chronicle, October 29.

"Mr. G. W. Piper, Uckfield, exhibited blooms and shoots of a new Tea rose named 'Sunrise, and an award of merit was recommended. It has very pretty little buds, and in point of colour is exceedingly attractive. Some of the outer petals are cerise-coloured, but the blooms have shades of copper and bronze."

The Garden, October 29.

"ROSE 'SUNRISE' (Tea).—This in its colouring, or more strictly combined colouring, is unique, the outer petals reddish-carmine, shading to delicate fawn and pale salmon within, the open blossoms of a pleasing yellow. The chief value of the flower is in the warmer tints that are so abundantly apparent as the flowers open, and these coupled with the bronzy foliage are charming. The flowers, too, are produced in great abundance, the buds being exceptionally well formed. From Mr. G. W. Piper, The Nurseries, Uckfield, Sussex."

Horticultural Advertiser, November 2.

"ROSE 'SUNRISE' (G. W. Piper).—A charming Tea-scented variety, most deliciously scented; a stand of blooms artistically arranged called forth many expressions of admiration. The flowers are salmon-apricot, outer petals bright cerise, the foliage deep bronze, which forms a fine contrast. We have seen the stock growing at home and the plants appeared very vigorous and free-blooming. Award of merit."

Healthy plants in pots will be distributed in May next, price **7s. 6d.** each; or **6** for **£2 2s.**

TRADE TERMS UPON APPLICATION.

All varieties of merit are grown. Our Stock this year is chiefly upon the Seedling Brier, and exceptionally well ripened.

A Descriptive Catalogue, drawn up on entirely new lines, free upon application.

NOTES OF THE WEEK.

THE AMATEUR QUESTION.

IN discussing the amateur question as it affects the National Chrysanthemum Society, in our issue of October 29, we appear to have somewhat ruffled the feelings of our good friend the editor of the official organ of that excellent body, the National Amateur Gardeners' Association, and to have brought upon ourselves what is evidently regarded as a well-merited reproof. We are not greatly perturbed thereby, and only refer to the matter for the purpose of showing how difficult it is to induce people to take common sense views of things, and to set our contemporary right on some matters of fact that have an important bearing upon the question. In referring to the advice given by the County Court Judge at Hastings to the representatives of the National Chrysanthemum Society, to have the rules relating to amateurs amended for the purpose of making them more intelligible, we said "the ambiguity has arisen in consequence of a want of appreciation on the part of a section of the committee of the fact that all cultivators who do not grow for sale are amateurs." We further stated that "a clear declaration that no one who systematically sells cuttings, &c., shall be allowed to compete as an amateur," was required, and, singularly enough, our contemporary dissents from our views upon both points. He is "quite satisfied" that "the gentlemen undoubtedly referred to have the interests of the *bonâ-fide* amateur at heart," and so are we. This, however, is not a question of heart, but of head, and what we did was not to question the desire of the members to serve the interests of the amateur, but to point out that, in consequence of the mistaken views held, the definitions referred to were so ambiguous as to render their proper interpretation difficult. We do not clearly understand what is meant by a *bonâ-fide* amateur, nor does it much matter; but we have too much respect for the judgment of the members of the committee of the National Chrysanthemum Society to believe for a moment that any one of them would support "any effort" made to put the different classes of amateurs on an equal basis, as our contemporary is satisfied they would do. Our perplexity with regard to the views of our contemporary on the status of the amateur is greatly increased by the startling statement that "we strongly disapprove of the suggestion that an amateur shall be a person who does not systematically sell." To disapprove of this suggestion is to approve of cultivators who grow for sale exhibiting in classes provided for amateurs, a procedure which the rules of the National Amateur Gardeners' Association and authority proscribe. Something also is said about the sale of surplus stock, and, although no reference was made to this point in our issue of October 29, the impression is conveyed in the course of the observations that we had expressed views in favour of this being permitted, and of the amateur who grows flowers simply for the pleasure he derives from them being placed at a disadvantage when he engages in a competition for prizes. The cultivator who disposes of his surplus cuttings, plants, or blooms for money would unquestionably "systematically sell," and therefore be debarred from exhibiting under the rule we suggested. But if an amateur, on giving up possession of his garden, is not allowed to sell the plants growing in it, or is not permitted to sell the stock of a seedling or sport to a nurseryman for the purpose of distribution, without being excluded from the amateur class at the exhibition, injustice would be done. Moreover, if amateurs are not to be allowed to sell in the manner indicated any novelties they may be fortunate in raising their efforts to improve the classes of plants in which they are interested will be discouraged, and the work of improvement checked; and to hinder progress is assuredly not one of the objects of either of the horticultural societies, of which, happily, we have such large numbers.

RULES FOR AMATEURS.

As the question of the rules under which amateur cultivators should be allowed to compete for prizes is engaging much attention, it may be useful to briefly refer to what has been done, with a view to satisfactorily define the status of this class of cultivators. The Royal Horticultural Society lays down the principle in its code of judging, which represents the combined wisdom of some fifty or sixty of the most distinguished horticulturists in the United Kingdom, that persons who do not grow for sale are amateurs, whether they perform the work of the garden or employ one or more gardeners. It is also pointed out in the code that, as there are different classes of amateurs, the schedule should be so arranged that the members of each class are able to compete under conditions that will place them in an approximately equal position, absolute equality being for obvious reasons impossible. The National Amateur Gardeners' Association, which has accomplished so much useful work, prescribes in its rules that "any amateur interested in the objects of the association shall be eligible for membership," and that "gentlemen who engage professional aid shall be entitled to become members, but shall not be privileged to compete at the meetings." These are excellent conditions, and it is very proper that it should exclude from membership those who dispose "of plants, flowers, seeds, or trade in garden produce for profit." No reference to the sale to nurserymen of novelties raised by the members is made in the rule, and consequently these can only be disposed of by way of exchange. "The definition of the N.C.S." is described by the official organ of the National Amateur Gardeners' Association as "much better" than the suggestion made in our issue of October 29, notwithstanding the strictures passed upon the two rules by his Honour Judge Martineau at Hastings. The National Chrysanthemum Society recognises two classes of amateurs, one (A) who does not employ more than one gardener, and the other (B) those who do not employ paid assistance. The two rules would occupy too much space to quote here, but as a proof of the views we hold as to the necessity of these rules being improved the Judge said that one rule defined what an amateur is, and the other what he is not, instead of their defining, as they were intended to do, two distinct classes. Our contemporary claims that the last-named rules are the embodiment of the rule of the association, but we look in vain for any rule of the National Amateur Gardeners' Association that justifies the assertion in our copy of the bye-laws. The most satisfactory rule bearing upon the question under consideration is that of the National Rose Society, and believing that its more general adoption would remove many difficulties we quote it in its entirety: "No person shall be allowed to compete as an amateur who sells rose plants (except when giving up possession of the place where they grow, and in the case of new seedlings or sports), rose blooms, or buds for budding, nor any person in the employ of a nurseryman. Any objection raised as to the rightful qualification of an exhibitor shall be referred to the committee for arbitration, and their decision shall be final and binding on both parties." With a rule such as this it is a very easy matter to group the amateurs according to whether they employ paid assistance or not, and, in the case of those who have paid assistance, according to the number of assistants employed. Were some such course as is followed by the National Rose Society generally taken, instead of endeavouring to set up boundaries that have not the sanction of authority, we should hear but little of the difficulties in connection with the status of the amateur.

ECCENTRIC PROTHALLI.

THE most striking instance of combined eccentricity obtained in Dr. Lang's cultures was that produced from a spore of Scolopendrium v. ramulosissimum. In many cases normal reproduction resulted, but in some, where fertilisation did not take place, fleshy cylindrical bodies were formed. In one instance this grew out and formed a simple bulbil at the tip, producing thus an apogamous plant, but in addition this cylinder was liberally dotted over with archegonia; and, to cap the climax, at the base of the said bulbil there was a clump of sporangia, or spore cases; so that three widely different stages in the life history of the fern were as closely conjoined as could possibly be. First, the embryo unfertilised seed would be at the base of each archegonium, then we jump over all intermediate stages, fertilisation of ovum, formation of fern, and subsequent development of mature fronds, which normally bear the spores, and get the spores cheek by jowl with the embryo, and finally, having performed these feats of juxtaposition, the little cylinder furnishes us with a perfect young plant of its own conception, a born orphan, whose only history was that of Topsy, "it growed." We had the pleasure of inspecting some of Dr. Lang's cultures during his researches, and it was most striking to anyone conversant with the normal life history of ferns to view these spore heaps actually *in situ*. The monograph we have referred to is illustrated by no less than eighty-three drawings of eccentric prothalli, which seem as if they had exhausted all possibilities in the way of variation; and it is worthy of remark that nearly all the ferns experimented upon are of British origin, the vagaries being noted in connection with two varieties of Scolopendrium vulgare, two of Polystichum angulare, one of P. aculeatum, one of Lastrea dilatata, three of Athyrium filix-fœmina, one of Polypodium vulgare, and several of Lastrea filix-mas. The theory, therefore, that the abnormal forms of plants as occupying a sort of debatable borderland between Nature's apparently hard and fast rules, and her actually infinite versatility, constitutes probably a rich field for research into Nature's secrets, has borne good fruit in this instance, as it has already in others, and we have no doubt that very much remains to be learnt in the same direction. The theory of alternation of generation in cryptogamic plants is shown by Dr. Lang's cultures to admit of many exceptions, and exceptions of all classes, but decidedly the most striking exception is embodied in the discovery that the first and last stages of fern life, viz., the prothalli, is a first product of the spore, and the spore itself may be actually conjoined. Apospory, to which frequent reference is also made in Dr. Lang's paper, cuts the life history of the fern down by eliminating the spore, then apogamy was found to occur in conjunction therewith, and cut it down still more by eliminating archegonia and antheridia, shortening it to fern, prothallus, fern; and now, to crown the edifice, the spore revenges itself by asserting itself again as a factor, and the poor fern proper is ousted altogether in its turn, the life history resulting being the insignificant one of prothallus, spore, prothallus, which degrades it to all intents and purposes to the level of the lichens.

Cold Storage of Fruit.—Under the auspices of the Technical Education Committee of the Kent County Council, Mr. W. P. Wright, the county superintendent of the horticultural branch, has been conducting experiments in the cold storage of fruit. In his report he shows that in the case of strawberries (1) the fruit cannot be kept long in a temperature of 36 degrees or upwards; (2) it can be kept for three weeks at least in a temperature of 30 degrees; (3) it is necessary to surround the fruit with cotton wool, or, in the case of fruit in sieves, to place a pad of that material over the top. If this precaution is not taken the fruit, though sound, becomes dull and loses the fresh, inviting appearance which is so important when it is offered for sale. The general results were: (1) The fruit must be placed in store in advance of dead ripeness, especially in the case of strawberries. Fruits that are fully ripe will keep for some time, but lose surface freshness, becoming seared and unsightly. (2) Cherries pecked by birds soon go off, and other fruits impaired in any way will not keep. To achieve success the fruit must be sound. (3) The fruit should be covered or surrounded with cotton wool. It was observable that that so treated retained its freshness much longer than that left exposed. (4) The chambers must be kept dry and close-fitting doors are necessary. (5) All decaying or impure matter must be rigidly excluded.

Value of Horticultural Certificates.—As there is at present a desire on the part of some small societies to give, and on the part of some growers to receive from them, certificates for plants and flowers, it is as well to remind such that these certificates have no real value, and sooner or later they serve to depreciate the plant for which they are awarded, owing to the ease with which they are obtained and the fact that (usually) such plants and flowers are not brought before, or else fail to obtain awards from, the properly constituted authorities. With our various national horticultural and floricultural societies in good going order, we do not, fortunately, suffer much from local certificates; but we agree entirely with an American contemporary, which, in discussing the matter, observes that there may be "a few individuals to whom all certificates look alike, the fact that they have received an award being sufficient; and undoubtedly such people will use a statement of this award in introducing their novelties Such tactics are not of a very high moral order. The awards made in many local societies are undoubtedly honest, so far as they go, but from the necessities of the case it frequently happens that the judges' opinions do not amount to very much, and certainly have no national weight. These certificates are not really worth the paper on which they are written, and therefore it would be sound practice for those whose novelties have been adjudged worthy by authoritative societies to advertise in their public announcements just what societies are referred to when it is claimed that a certificate has been awarded."

Royal Gardeners' Orphan Fund.—Mr. A. F. Barron informs us that the next election of children to the benefits of this fund, consisting of an allowance of 5s. per week until they attain the age of fourteen years, will take place early in February. All applications must be made on a proper printed form, copies of which may be obtained gratis of the secretary, or any of the local secretaries. Such forms must be correctly filled up, duly signed, and returned to him at Sutton Court Road, Chiswick, by Tuesday, December 20, 1898.

Experiments with Manures at Hatley.—Under the auspices of the Cambridge and Counties Agricultural Education Scheme Mr. T. B. Wood has been conducting rotation experiments on the Vice-Chancellor's farm at Hatley, and the results were given before the Cambs and Ely Chamber of Agriculture on the 26th ult. Mr. Wood stated that the soil at Hatley was a stiff, wet clay, and on the plots with no manure they had an extraordinarily poor crop of roots—only 4 cwt. per acre. Farm manure gave very poor results indeed; it only increased the produce of swedes by about one and a half tons, and the barley by something under five bushels. Ten tons of manure were placed on two plots, and there was a loss in each case. They could not definitely pronounce on those plots yet; they could only say at the present time such manure had not yielded a sufficient increase of produce to pay for itself. At Thriplow, on a gravel soil, farm manure had paid very well. There they had a profit of 30s. at the end of the second year; at Hatley they had an average loss of 21s. per acre. The moral of that was that on a gravel soil animal manure very soon acted, but on a heavy, wet clay it did not act quickly, and it did not produce much result in the first two years. There were three plots on which they used 7 cwt. of artificials. The average yield of swedes on those plots was 5 tons 19 cwt. per acre, and the average amount of barley was 29⅓ bushels, an increase of nine bushels over the no-manure plot. Artificials on heavy soil appeared to act more quickly and gave a greater increase than on the gravel soil. The adding of artificials to the manure had made a very great difference on two plots. The plots which received the smallest dressing in the first year and a dressing in the second year were those which had paid best at Hatley. A dressing of artificials increased the quantity of straw to the extent of half a ton per acre. One experiment was designed to inquire into the reason why farm manure did not do so well at Hatley as they might expect it to do. They thought the reason might have something to do with the subject of denitrification, and their experiments seemed to show that well-rotted manure did not, on clay soil, interfere with nitrate of soda, or nitrates generally, but hot fermenting manure did. Nitrate of soda added after hot fermenting manure did not produce any considerable increase—only 3 cwts.—in the straw per acre, as against three times that amount when nitrate of soda was applied to short dung. Mr. Wood intends to inquire into the subject of deep cultivation, and, if necessary, conduct experiments therein.

Gardening Charities.—We have on several occasions directed attention to the great value of flower stalls at horticultural exhibitions, and collecting boxes as a means for augmenting the income of the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund, and it would be gratifying to know that they were taken fuller advantage of. As showing what may be accomplished in this direction we would mention that the other day the secretary of the first-named charity informed us that he had received a cheque from Mr. Treseder, of Cardiff, for over £5, the proceeds of a flower stall at the chrysanthemum show at Cardiff, and at the meeting of the committee of the second of the charities that the following amounts had been received as the result of sales of flowers: Mr. W. Bryant, Rugby Chrysanthemum Show, £7 5s.; Mr. J. Hughes, Birmingham Chrysanthemum Show, £4 3s. 4d.; and the Sevenoaks Gardeners' Society, £4; while Mr. R. Scott, of Bradford, sent £1 10s., the amount collected in his box. In addition to the contribution from Mr. Treseder, the secretary of the Gardeners' Royal Benevolent Institution has received the sum of £21 from the Reigate Chrysanthemum Society, being a share of the profits of the recent exhibition.

The *Starling* as a Friend of Gardeners.—A correspondent from Wiltshire states that to describe the starling as a wholesale depredator in the matter of fruit, as some folks are doing, is ridiculously untrue, at least, he writes, "in this part of England. He will peck a ripe apple or pear occasionally in the autumn, but I have never known him to touch strawberries, gooseberries, raspberries, currants, or any of the earlier fruits. I may, I think, claim to have some knowledge both of birds and of gardening. I have lived for thirty years in this county, and have paid special attention to the habits of birds ever since I was old enough to see them. Moreover, I have been certainly for twenty years a keen gardener. Every year there are at least half a dozen nests of starlings on our premises."

National Rose *Society*.—The twenty-second annual meeting of this society will be held in the rooms of the Horticultural Club Hotel, Windsor, on Thursday next, December 8, when, in addition to the usual routine business, the following new regulations will be submitted for the consideration of the members: "In the three trophy classes at the metropolitan exhibition, and in the two trophy classes at the provincial exhibition, the blooms must be staged in boxes of the following dimensions, viz.: Twenty-four blooms in boxes 3 feet 6 inches long by 1 foot 6 inches wide, and eighteen blooms in boxes 2 feet 8 inches long by 1 foot 6 inches wide—all outside measurements." The house list of officers and members of committee that has been issued contains several new names, these comprising Sir Weetman D. Pearson, Bart., M.P., and the Mayor of Colchester, who are recommended for election as vice-presidents; and Mr. F. W. Campion, Mr. R. B. Cater, and Mr. R. Foley Hobbs, who are recommended as members of committee. The annual dinner will take place at half-past five p.m., or immediately after the annual meeting, at the Hotel Windsor, with Mr. R. B. Cater, president of the Bath Floral Fête Committee, in the chair. The dinner is not limited to members of the society, but those who intend being present must signify their intention before December 6 to the honorary secretaries, the Rev. H. H. d'Ombrain and Mr. E. Mawley. The musical arrangements will be under the direction of Mr. J. D. Pawle, one of the vice-presidents.

Wagner's *Solution* for Chrysanthemums.—Some few years ago Professor Wagner, of Darmstadt, prepared a formula for a liquid fertiliser; this has become known as Wagner's Solution, and in America it has become popular in some districts as a liquid fertiliser for chrysanthemums, to be used twice a week, commencing about six weeks before the flowering season, and continuing until the flowers begin to fade. The solution is made thus: 2 oz. phosphate of ammonia, 1¾ oz. nitrate of soda, 1¾ oz. nitrate of potash, 1⅓ oz. sulphate of ammonia, and 50 gallons of water. This is useful for other subjects than chrysanthemums.

The Extermination of Prickly Pears by Cochineal Insects is a matter that has at various times engaged the attention of the Madras Presidency. In a report of the Madras Government Museum Dr. Bourne discusses the practicability of destroying prickly pear (*Opuntia Dilleni*) by means of the cochineal insect, and shows that the historical evidence weighs entirely against such destruction. There seems to be no doubt that the cochineal insects and the cacti are introductions, and the net result has been that the yellow flowered cactus has thoroughly naturalised itself, while the cochineal insect has just manged to struggle on here and there. There is evidence that cochineal insects were introduced five times between 1795 and 1883, with a view to the establishment of the cochineal industry in the country. In 1807 Government offered a reward of £2,000 for its successful introduction, but it never became thoroughly established. It was, however, possible that, although a fine variety of the insect best for industrial purposes would not flourish, a wilder variety might become more or less naturalised. This has occurred to a small extent, and the idea of utilising this to destroy pirckly pear has been from time to time put forward. Dr. Bourne's investigations, however, show that it is impracticable to destroy prickly pear by the so-called "wild" variety of the cochineal insect; and, even if the scheme were practicable, he doubts the advisability of encouraging the development of an insect which might eventually become an infinitely greater pest than the prickly pear.

Craterostigma pumilum (Hochst) is a very rare plant collected in Somaliland by Mrs. Lort Phillips and brought home by her. It flowered and seeded at the Cambridge Botanic Gardens during the past summer, and its peculiarities formed the subject of a paper, jointly prepared by Professor Marshall Ward, F.R.S., and Miss Dale, read at a recent meeting of the Linnean Society.

The Golden-rayed Lily (*Lilium auratum*) is at once one of the most beautiful and disappointing of the plants grown in the flower garden, the disappointment being in a large measure due to the rapidity with which imported bulbs degenerate when committed to British soil. Trustworthy information with regard to the cause of the degeneration and its prevention is therefore welcome, and the observations made by Mr. Wallace in the course of a lecture given before the National Amateur Gardeners' Association are deserving of the fullest publicity. According to the report in the society's quarterly journal Mr. Wallace described this lily as the finest in existence, and one that, if it does well, is magnificent, and when it fails does so absolutely. There are various forms, such as pictum, rubro-pictum, rubro-vittatum, cruentum, and the best form of all, Wittei, which is unspotted. Mr. Wallace said he could speak of auratum the whole evening, but he would sum up its requirements in a few words. Growers cannot give it too much shade or coolness. It grows well in Scotland. With regard to auratums "going off," his idea was that when the species first came from Japan the bulbs were small, being then collected from their wild homes. When they arrived in this country they were planted in soil richer than they had been previously used to, and the result was all that could be desired. Now, in response to the large demand for the lily, the bulbs are grown on for European markets in land very highly manured. The result is enormous bulbs which, on arrival here, are put into our gardens consisting of soil not so rich in manure, and the change is seen in the disease from which this lily suffers, caused no doubt by the overfed bulbs. Mr. Wallace then gave particulars of what had been done with a small bulb, two inches in diameter, early in 1865. It was potted in a seven-inch pot and produced that year three flowers in one stem; in 1866 it was shifted into a nine-inch pot and produced two stems and seventeen flowers. The following year shifted into an eleven-inch pot, the bulb throwing three large and three smaller stems, produced in all fifty-three flowers. In 1868 the pot was increased to a sixteen-inch, and that year there were five stems and seven smaller ones, bearing altogether one hundred flowers. In 1869 the bulb was taken out of the pot and a small portion of the old soil taken away. It was then put into a seventeen-inch pot and treated as before. It responded to the treatment by throwing up thirty-nine flowering stems, ranging from two to nine feet in height, and produced a total of one hundred and ninety-three flowers. In 1870 it was undisturbed, and threw up forty-three stems with two hundred and eight flowers. In the autumn of 1870 the mass was broken up, and there were found to be seventy bulbs, ranging in size from seven inches in circumference to bulblets scarcely formed—the product of one bulb in five years. The last we hear of this bulb was in 1873, when it was showing seventy stems and still doing well. Mr. Wallace had photographs of this wonderful specimen taken in three different years, which were shown to the meeting, and attracted much attention.

National Amateur Gardeners' Association.—This admirably managed society continues, we are pleased to learn, to grow in strength and usefulness. In June last there were 676 members on the books, and since that month 43 have joined, making a total of 719, which is eminently satisfactory. The association will hold its annual dinner at the Holborn Restaurant on Thursday, December 15, the hour fixed for the function being half-past seven p.m., the reception taking place half an hour earlier.

Chrysanthemum Exhibitions, 1899.—The committees of the leading chrysanthemum societies are now busily engaged in arranging their fixtures for next year, and we have already received notification of the fact that the Hull Chrysanthemum Society will hold its exhibition on November 15 and 16, and the dates of the Birmingham Chrysanthemum Society are November 7, 8, and 9.

Fruit Nomenclature has for some time past been engaging the attention of American pomologists, and the Horticultural Club of the Cornell University has prepared a code for naming fruits, of which the following is a brief summary. (1) The name of a variety of fruit shall consist of one word, or at most of two words. In selecting names simplicity, distinctiveness, and convenience are of paramount importance. The use of such general terms as seedling, hybrid, pippin, beurre, damson, &c., is not admissible. Nouns must not be used in the possessive form. McIntosh's Red, Crawford's Early, Bubach's No. 5, must be written McIntosh Red, Crawford Early, and Bubach. Numbers are to be considered as temporary expedients to be used while a variety is under trial. The name of no living horticulturist should be applied to a variety without his full consent; and the name of no deceased horticulturist should be used without the general agreement of living horticulturists. An author publishing a new variety should use the name given by the originator, or by the introducer. (2) In the full and formal citation of a variety name the name of the author who first published it shall also be given. It is expected that such citations of names will be used only in elaborate works on pomology, in scientific publications, or in some cases where they are necessary for clear discrimination of synonyms. (3) No two varieties in the same group shall have the same name; and the name first published for a variety must always be used to designate it. All names subsequently published must stand as synonyms. The term "group" as here used shall be held to designate the large general groups specified by words in common language, such as raspberry, plum, apricot. (4) Publication consists in the public distribution of printed name and description, the latter giving distinguishing characters of fruit, tree, &c., or in the publication of a new name for a variety properly described elsewhere. Such a publication may be made in any book, bulletin, report, trade catalogue, or periodical, providing the issue bears the date of its publication, and is generally distributed among nurserymen, fruit growers, and horticulturists. (5) No one is authorised to change a name for any reason except when it conflicts with these rules.

Chrysanthemums for Her Majesty.—Messrs. W. and G. Drover, the well-known chrysanthemum growers of Trinity Street, Fareham, recently had the honour of submitting four dozen handsome cut blooms of chrysanthemums to Her Majesty the Queen, at Windsor Castle. Her Majesty greatly admired the Messrs. Drovers' productions.

Hydrocyanic Acid Gas as an Insecticide.—On more than one occasion this powerful gas has been suggested—almost advocated—as an insecticide, especially for collections of orchids. We, however, thoroughly endorse the remarks of Dr. Kitchen, in *American Gardening*, who, while admitting that the gas will destroy every form of life, animal as well as vegetable, if used of sufficient strength and for a long enough time, warns growers against its use, on two grounds. One is that there are some insect forms that will not succumb to it unless a sufficiently strong solution of gas is used to have a caustic effect on plants of various kinds, and one trouble of the long immersion of plants in even a dilute solution of the gas is that too much is absorbed by the plants and more or less injury to them is effected. Furthermore, the gas sometimes "banks" up in certain parts of the house. Quite apart from these considerations, however, is the one that the use of hydrocyanic acid gas prepared for insecticidal purposes is too frightfully dangerous to warrant it being handled by any but the most skilled hands. In the course of experimenting with the gas Dr. Kitchen has had several narrow escapes, and he says he has been made very dizzy even by a quick walk of twenty-five feet to the ventilating apparatus in a house at nine a.m., in which the gas had been generated at five o'clock the previous afternoon. One is liable to be burned by the handling of the sulphuric acid alone, as well as suffer danger to clothing, adjacent plants, and structures, during the generation of the gas, or the subsequent clearing up after the process. The whole method is dangerous, inconvenient, and entirely too costly for general use. Formalin gas is safer and as effective both as an insecticide and as a disinfectant. It, too, is caustic in its effects on plants; but is a splendid disinfectant for empty houses, and can be used without danger for that purpose.

The Condition of the New Forest.—In a Blue Book just issued Mr. E. Stafford Howard, Commissioner for the New Forest, gives much interesting information concerning this and other forest lands that are Crown property. During the year ending March 31 last the sales of forest produce from the New Forest realised £8,624 16s. 7d., as compared with £7,355 4s. 11d. in 1896-97, and certain surface rents realised £3,073 10s. 8d., as compared with £3,099 11s. 8d. in 1896-97. Of much more importance, however, is Mr. Howard's statement that his attention has been specially drawn to the condition of certain of the old woods in different parts of the forest which are rapidly decaying, and must inevitably perish and disappear in the course of time if no steps are taken to prevent it. The area of these woods is estimated to be about 5,000 acres. Under the New Forest Act of 1877 they cannot be reinclosed or in any way protected with a view to their regeneration. In a few of them, owing to favourable circumstances, natural regeneration is taking place to a large extent, and little fear need be entertained for their future. As regards others there is a partial regeneration, as to the sufficiency of which opinions may perhaps reasonably differ; but there are some whole woods and portions of others as to which there cannot be two opinions, and unless means be adopted to encourage and protect a young growth of trees these woods must in course of time disappear. He proposes dealing more fully with this matter in the next report, but thinks it well to call attention to it now, in order that those interested in the preservation of these ancient woods may realise that the question is serious and urgent.

The Retailer's Profit on Apples.—At the hearing of a case brought before his Honour Judge Addison, Q.C., at the Southwark County Court, a few days ago, it was shown that a widow, Mrs. Fitzgerald, who distributes apples by pennyworths from a basket in Change Alley, earned as a rule from 7s. 6d. to 10s. per day by the sale of the fruit.

Two New Eucalypti.—At a recent meeting of the New South Wales Linnean Society Mr. R. T. Baker described two new species of Eucalyptus from New South Wales. These are well-defined species, remarkable for the chemical constituents of their oils, belonging to the group Renantheræ, and known vernacularly as Silver Top Stringybark and Messmate respectively. For the first of the two the name E. lævopinea is suggested, because the oil obtained from the leaves consists largely of pinene, which is lævo-rotatory; and the name E. dextropinea is proposed for the second species, owing to the oil consisting largely of pinene, which in this case is dextro-rotatory. In both the specific rotation is greater than in the well-known pinenes obtained from the Coniferæ, although chemically identical.

American Potato Crop.—According to official reports, the potato crop in the United States has this year amounted to 203,264,000 bushels, 29,148,000 bushels more than in 1897, but 42,216,000 less than in 1896.

A MORNING MIXTURE.

Diluculo surgere saluberrimum est.

IT is natural to drift to fruit at this time of year, for planting, in favourable spells of weather, is in full swing. I daresay many of my readers have noticed the difference of attitude assumed towards this phase of work by private and market growers. A good many of both read this paper, more of the latter than there used to be, I think. Some short time ago the raspberry pruning question cropped up amongst a group, and one of the party referred to a discussion in the—well, we'll call it the *Gardeners' News*. The others corrected him on the spot. It wasn't in the *News*, it was in the MAGAZINE. Of course, the other individual knew he was right, and there might have been a long argument if the quietest member of the party had not promptly fished the paper out of his pocket, and clinched the matter by turning to the "Mixture." Happily, my blushes were unobserved. But this by the way. The difference of attitude referred to in the first part of this paragraph is very marked. In private gardens fruit planting is often a matter of terrific agitation; on the farms it is proceeded with in the most nonchalant way.

I often think that gardeners make a great deal too much of planting, and market men too little. The former do it to the accompaniment of a considerable amount of article writing and reading, and plenty of wrangling over minor details; the latter do it with no fuss at all. Both are wrong. Fruit articles are often very tiresome because they reiterate stale things, which are often not less misleading than old, but a certain interchange of opinion does good. Doubtless, on the whole, the gardener plants fruit better than the farmer. He has not to think about the labour bill. When the private gardener merges into the market grower he almost always finds that he has to drift into the field methods. It might not be so if his capital were very large, but generally it is very small.

There is one thing in which I think both sections make a mistake, and that is in putting a considerable quantity of manure beneath the trees. I do not object to the plan, for the reason (which I have seen stated) that the young fibres are injured by coming into contact with strong manure, nor even because of its causing excessive vigour, although there is undoubtedly something in this. What seems to me so dangerous is the rotting down of the manure, the reduction of its bulk, and the consequent gap right below the roots. A cavity of this sort serves as an admirable water trap, and, if no harm results in well-drained land, I am positive that it accrues in heavy ground that is not well drained. I have read many miles of articles on fruit planting in the course of my career, but I never remember to have seen this point raised. It is a very real one, depend upon it. A very little reflection suffices to show its theoretical strength, and a good deal of close personal observation has convinced me that it is practical, too. I believe it to be a fertile source of canker.

I have referred to advice on practical matters that is not only stale but bad. I suppose I shall catch it from some of my kind friends for dragging in raspberry pruning as an instance, but it is so glaring a case that the temptation is too strong. I once before timidly alluded to it, and I believe I was chastised then, but I am prepared to endure a lot of rough handling when I think I have good grounds for what I say. Surely the elaborated sap in mature canes must, in descending, nourish the crowns at the base, and, if it does, why cut them out in summer? Peter has been as much against me as anyone on this matter, but I really believe that for the first time in his life he is going to let me have my own way willingly. He has not said so in distinct terms, probably he never will, but there are signs and tokens not to be mistaken.

Of course this fact will add considerably to the attention which is being given to me. I can fancy readers experiencing a sudden quickening of interest, and muttering: "Oh! well, if Peter agrees, it's a different matter." The modification of his opposition has been brought about in a very simple way. When in town for the rust conference it appears that he availed himself of the opportunity to pay a long-deferred visit to a "neffy" in Kent. He went and returned per bicycle, and seems to have caused no more damage than could be reasonably expected. I have heard a good deal of this particular Kentish nephew. He has been quoted against me more than once. But now was the time for my revenge. He showed Peter the fading hops, and explained how careful the best growers were to leave the bine on the stools until it has thoroughly ripened and the sap all gone down. On no account do they remove it immediately the hops have been gathered. I do not know whether Peter would have put two and two together even then had it not been that in the return journey he came into violent collision with a tree. Over in the field where the latter fell were raspberries. Need I say more? LUX.

The Climate and Flora of Christmas Island.—Mr. C. W. Andrews, who has been making a complete examination of Christmas Island stated before the Royal Geographical Society that this little spot in the Indian Ocean had a delightful climate. During the greater part of the year it resembled a very hot English summer tempered with sea breezes. The island was perfectly healthy. there being no marshes or stagnant pools, while there was a fair supply of good water. The whole island was covered with forest except the spray-swept edges of the sea cliff and the vertical faces of the inland cliffs Many creepers and ferns added to the beauty and variety of the forest scenery. For some years Mr. Andrew Ross, brother of Mr. George Ross, the owner of Keeling-Cocos Island, had been settled in Flying Fish Cove with his family and a few men from Cocos. During his stay some substantial houses had been built, wells sunk, and fruit trees and cocoanut palms planted, and a small experimental plantation of coffee had also been made, the results showing that the island was well suited for coffee growing. In May last the total population of the island was about forty.

NOTES FROM IRELAND.

GROWERS who plant chrysanthemums outside every year in the hope of procuring a few blooms have this year been rewarded with an abundant crop. Large masses of early flowering varieties have been magnificent, while really creditable blooms of both Japanese and incurved varieties are to be seen growing against walls and fences; in fact, some plants in a garden near here, where the blooms were disbudded, are as good as any I have ever seen grown under glass for decorative purposes. Of course, none are up to exhibition standard, but nevertheless are very valuable for decorating. Some beds of single varieties are a superb sight, and pompons are in close competition. A charming new early flowering variety on Mr. W. Wells' (Earlswood) stand at the late Dublin Show was Mytchett Beauty, a rich golden yellow, and a pleasing contrast to it was Crimson Pride, a very dark crimson variety. These two caused a great sensation at the show quoted, and were greatly admired by all.

We had our first frost on the morning of November 18, but up to that date summer bedding plants were in full flower, but now there is not much left but snapdragons and monthly roses. Trees and hedges, too, dropped their foliage with astonishing rapidity. Hardy fruits should, other circumstances permitting, be a good crop next year, as the trees are bristling with fruit buds. When at Mullaboden recently I noticed the back wall of a stove there covered with Ficus repens, which had extended several yards through the house on the wall outside, and was thriving splendidly, the foliage being far larger and more luxuriant than inside the house. At the shady end of the conservatory, where nothing bright in colour could be induced to grow, Mr. Mitchison planted a few years ago two specimens of Begonia fuchsioides, which have covered the wall completely, and look charming there, where I saw them in full flower. The best berried plants of Cratægus pyracantha and C. p. Lelandi I have ever seen were noted on the pleasure ground walls at Mullaboden.

The finest specimens, in quantity, that I have yet seen in Ireland of Blenheim Pippin apples were those exhibited at the recent Chrysanthemum Show at Ball's Bridge, by Messrs. Dickson and Son, of Newtownards. They were simply superb in size, shape, and colour; it was not simply a dish of apples, but a huge basketful. Bramley's Seedling, too, in the same stand was splendid. This exhibit was probably the largest yet put up in Ireland; it was of two hundred varieties, the same as frequently put up, but instead of from three to six fruits of a variety, as is generally the case, there were in this exhibit but few dishes of six, most varieties being represented in quantities, ranging from that number to baskets containing about a bushel. That fruit growing has made enormous strides in Ireland is evidenced by this splendid exhibit from the go-ahead firm under notice. It would give exhibitors on your side of the Channel enough to do in a competition to beat Irish fruit growers now. The show of both apples and pears from private gardens made a brave show of magnificent fruit. Blenheim Pippin appears to do well everywhere in Ireland, judging from the splendid examples of this variety brought from districts widely separated. Wonderful, too, were the dishes of Beurré d'Amanlis pear, which for flavour appeared to find most favour with the judges. A promising apple was exhibited by the Messrs. Saunders, of Cork, under the name "Beauty of Friar's Walk," at the recent show, which has since been awarded a certificate of merit by the Council of the Royal Horticultural Society of Ireland. A similar award was also made to Mr. Wells, of Earlswood, for his collection of chrysanthemums, and we were all delighted to learn that he had also been awarded a gold medal in Paris, the information reaching Dublin forty minutes after the award was made in Paris.

Permit me to endorse Mr. Harrow's recommendation of winter-flowering begonias for decorative purposes. The best and most charming of them all is to my mind Begonia Gloire de Lorraine. It is a capital subject for use in groups of plants, also for house decoration. Although I cannot claim to be one invited to respond to "S. P." on "Is the Onion Surface Rooting?" perhaps I may be allowed to negative the query. Certainly, if one only surface cultivates the ground, and leaves the soil undisturbed save for a few inches on the top, so that the subsoil is hard and poor, then the onion becomes a surface rooter right enough, ripens prematurely, is undersized, and of little use for keeping. But, given deeply-cultivated and well-manured ground, save in exceptional cases, one can rely on large and sound onions. Their roots, too, will be found for more than a foot below the surface, as witnessed when digging old onion ground after the crop was cleared. Where quantities of onions are required for pickling purposes "tickling" the surface will answer fairly well, but that, "S. P.," is as far as I am prepared to agree with your lecturer. I shall be interested in reading the reply of Mr. Beckett and other celebrities to the query quoted. I fully thought that the age of surface cultivation was past and gone—at least, as far as vegetables are concerned—but reallv to hear of a County Council lecturer advocating surface "tickling" is a little too degenerate. I trust his audience will make it warm for him the next time he advocates that system.

Brownstown Farm. R. WELLER.

The Forest Lands of Northern Wisconsin have, according to Mr. Fillibert Roth, been treated destructively. The wooded area is steadily being reduced, and at present nothing is done to protect or re-stock the "cut-over" lands, which are now unproductive waste land. Mr. Roth estimates that this policy causes a loss of eight hundred million cubic feet of wood per year to the State, besides driving from the State the industries which have been most conspicuous in its development, depriving a cold country of a valuable factor in its climatic conditions, and affecting detrimentally the character of the main drainage channels of the State. It is hoped Mr. Roth's report will aid in the formulation of rational forestry legislation, and so help to develop and restore the great forest resources of the State of Wisconsin.

PANSIES PRIM.

The pansy is my second plant to represent the genus Viola. It is one of the oldest favourites in our English gardens, and its quaint beauty has gained for it many names. Canon Ellacombe and "Plant Lore" must again be my authority for these. The Anglo-Saxon name of banwort, or bonewort, cannot now be satisfactorily explained, nor can the common names of pansy or pawnce, though Shakespeare was quick to seize upon such "pansies for thoughts." Heartsease was once the name of the wallflower. Our poet's names for the pansy are Love in Idleness and Cupid's flower. The "Midsummer Night's Dream" has the pansy under both names. Says Oberon :—

> "Yet marked I where the bolt of Cupid fell ;
> It fell upon a little Western flower,
> Before milk white, now purple with love's wound,
> And maidens call it Love in Idleness.
> Fetch me that flower ! the herb I showed thee once,
> The juice of it on sleeping eyelids laid
> Will make it, man or woman, madly dote
> Upon the next live creature that it sees."

The name Love in Idleness is still used in Warwickshire. It signifies love in vain, as in Chaucer : "If God ne kepe not the citee in ydel waketh he that keptit it." Other names are Herb Trinity, Three Faces Under a Hood, Fancy Flamy, Kiss Me or Cuddle Me to You, Tickle my Fancy, Kiss Me ere I Rise, Jump up and Kiss Me, Kiss Me at the Garden Gate, Pink of my John, Tittle my Fancy. The two floral descriptions, "violets dim," "pansies prim," one by Shakespeare, the other by Spenser, may be taken, I think, as the shortest, yet sweetest and truest in the language.

"The pansy heartsease maidens call," writes Drayton. Milton uses it for Eve's couch and Sabrina's wreath, while "the white pink, the pansie freaked with jet, and the glowing violet" are mourning flowers for Lycidas. Rapin calls it "Jove's own flower, in which three colours meet, To rival violets, though without their sweet."

The pansy violet, or heartsease, is a most variable plant, but easily distinguished from other violets by the branching stem, large leaf-like stipules, and the purple, white, yellow, or tricoloured flowers with their characteristic upper petals overlapping and coloured and broad lower ones. Its habit of growth varies from that of a weak, almost annual plant, as V. tricolor, to dense perennial tufts in alpine forms. It is abundant, according to the "British Flora," throughout Europe and Britain, being, like tobacco, "a weed of cultivation." The chief British species are the field pansy, the garden pansy, and Viola lutea, with compact foliage and richly-coloured flowers. The insect fertilisation of the pansy is brought about in a most ingenious way. The visit is induced by the attractive store of nectar provided by the flower. To reach it, the insect, directed by the brilliant honey guide, or central eye, and supported by the fringe of hairs surrounding the opening of the spur, inserts its proboscis under the cone of anthers, and along the channel of the lower petal, meeting and moving the style as it dives deeper into the spur in search of nectar. Two results are generally brought about : The quick, brushing action of the pollen-laden proboscis, on entering, opens a little projecting lip upon the style, and deposits some grains within it, the same quick brushing action, on retreating, closes up this lip, so that the foreign pollen is now within the hollow style, and fresh pollen is placed upon the departing insect from the flower whose anthers it has dislocated. Bertram, the friend of Linnæus, is said to have been won to botany by the pulling of a pansy. He was a farmer, and while in the fields gathered a flower at his feet. He pulled off its petals, and was so struck by the grotesque likeness of the pistil and stamens to an animal with head and arms that he took the flower home and let its study decide the bent of his mind.

The origin of the pansy is very obscure. Charles Darwin in his "Variation of Animals and Plants under Domestication," says finally, "after having very carefully compared numerous varieties, I gave up the attempt as too difficult for anyone but a professed botanist." He noted, however, that it was grown in Evelyn's garden in 1687, and that it was cultivated in the gardens of the nobility from 1810, that Lord Gambier collected many wild ones, and with the aid of his gardener, Thompson, raised selected seedlings with the dark lines of the wild flowers converted into a central blotch, and he contrasts the small dull elongated flowers, found wild, with the large bright circular specimens seen at shows. Florists, he states, believe these latter are descended from V. tricolor, V. lutea grandiflora, and V. altaica intercrossed. His keen observation made him remark the difference in the spurs of the flowers. Those from one nursery, he states, were bent, while those obtained from another were straight, and he suggests this difference might give a clue to their parentage. In "Some Notes on the Genus Viola," by Professor Hillhouse, given in the Viola Conference Report of 1895, it is stated further that these "natural hybrids," cultivated pansies, probably arose in the crossing of these species in "les jardines des curieux," but that the historical evidence is so vague that it is valueless. "The original species from which the pansies are derived is only to be found by careful comparisons between the seedling and its supposed parents, by analysis, in which, by selecting the seedlings most unlike their parents, again and again in turn, the tendency to reversion is used to its utmost limits, and last by endeavouring to build up the pansy again, by crossing the supposed parent forms, with a view to produce plants similar to the cultivated variety. The results might never reveal the first of the many forms of pansies, but they would certainly establish more distinctly the relationship existing between what we now have to regard as separate species of wild ones."

Dr. Wittacck, director of the Botanic Gardens, Stockholm, has most kindly permitted me to use his viola studies : the careful notes, descriptions and many beautiful drawings from Nature make them a most valuable addition to the history of pansies. The earliest drawing is dated 1836, and the flower is styled Herba trinitatis. A year later Ruellius calls it Pensea. Gerarde terms it Viola tricolor, and so does Parkinson, who figures both the single and double forms. In 1583 Clusius states V. lutea to be cultivated ; in 1700 Miller describes the same flower as V. calcarata in error. Following Darwin's account, Dr. Wittacck states the native species to have been collected and careful selections made in the gardens of Lady Bennet, Lady Monke, and Lady Gambier. The hybrids were derived from V. tricolor, V. lutea and its var. grandiflora. Fortunately, these crosses proved also fertile, so that by 1835, as Darwin stated, four hundred varieties were on sale.

The species V. altaica was introduced in 1816, but is so rare and unlike the present-day pansies that it would seem to have played but little part in their production. In 1834 Paxton defined the perfect pansy of the present day as "having flowers well raised above the foliage ; smooth petalled, flat, unfringed, of lasting colour, and with small eye." Later, the florists said it must be circular. Ten pounds at this time was refused for a seedling of Metropolitan. Five shillings was the common price of a plant. The popularity increased so far that in 1841 the Hammersmith Heartsease Society was founded, and in 1845 the Scottish Pansy Society. Meanwhile, in France, a new race of pansies, the Trimardeau, fancy or continental variety, was produced as a sort of protest against the circular British show form. In 1861 the habit of the pansy received attention ; V. tricolor is but an annual, and its progeny naturally had a similar brief, if bright, career. This defect was remedied mainly by Messrs. Grieve and W. Dean, who crossed V. lutea with the show pansy of the day, to obtain a more perennial character in the progeny. The seedling Bluebell, kindly sent by Mr. R. Dean, splendidly shows this character. His notes on "Old Violas," in the Viola Conference papers for 1895, are very helpful in the history. Mr. James Grieve, of Edinburgh, who was the raiser of most of the first violas or bedding pansies, has now kindly sent me the following notes for this paper:—

The viola of to-day has more of the fancy pansy blood in it, which is to be regretted, as the fancy pansy, V. tricolor, is naturally an annual, whereas the first violas were more of the perennial. In answer to the question, What are the points of a perfect viola in contrast to those of a pansy? Messrs. Greeve replied, "As a bedding plant, the compact habit, medium blooms of distinct and telling colour, profusion of blooms, and a good constitution are the main points of the viola. Habit is not so much taken into account in the competition viola, but size of bloom and delicacy of colour. One of the main points of the pansy is size. To meet the demands of the present day it cannot be too large, if well balanced and not coarse. In shape a pansy should be as nearly circular as possible. The blotches well formed and distinct, the margin or belting to be as near as possible the same depth all round, a solid eye, without the tendency in many varieties to run into the blotches. The petals to be of good substance, with a rich velvety texture and bright colour. Pansies for massing are practically merged with violas. A better name for these latter, suggested by Mr. Robinson, is that of tufted pansies. They are all viola hybrids, and the distinction is one of origin and habit only.

During the year 1881 "Rayless" violas were introduced, but they did not become widely known until Dr. Stuart, of Chirnside, raised his beautiful Violetta. With the utmost kindness Dr. Stuart has sent me this summary of his work. I gather from it that in 1874 he sent six seedlings for exhibition before the Royal Horticultural Society, London, produced by crossing Pyrenean Viola cornuta with a blue bedding pansy, and the resulting cross with a pink pansy. Six first-class certificates were awarded for these plants on account of their fine habit, sweet perfume, and abundant flowers.

The suggestion of a florist friend that Dr. Stuart should attempt to raise a rayless flower induced a continued search amongst the seed beds for several years. In 1887 Violetta, a white rayless self, was discovered, and the next step was to cross-fertilise the bedding pansy Countess of Rosebery with pollen from Violetta, the beautiful Sylvia was the result. Dwarf tufted forms can be alone obtained from crosses with dwarf alpine species, which latter must be the seed bearer, or the produce will have the bedding pansy character only. Dr. Stuart concludes by remarking upon the grower's productions, who claims to have raised a true cross between the sweet-scented violet and the pansy, "That they are all seedlings from Violetta without any cross at all. The cross mentioned has yet to be accomplished, and there is no reason why it should not be effected." That Dr. Stuart has received the highest praise for his notable work will be realised by all who see the beautiful specimens he has raised.

The rest of Dr. Wittacck's summary gives the results of his investigations, which briefly are that pansies are an aggregate of hybrids of species of viola. The original stock was V. tricolor ; others have been grafted upon it, principally V. lutea. Pansies, by their weak constitution, show they have more of the V. tricolor strain. They cannot be called species, but rather violas × large-flowering garden pansies. He draws particular attention to the change in outline and the length in the spur, in addition to colour, blotch, and honey guide already mentioned.

The problems for the future raiser are to make it more perennial. V. calcarata, V. altaica, and V. latisepala should be tried. True-seeded varieties, selfs, and perfumed pansies are yet to be desired. Wild pansies grow both with and without spurs ; garden pansies might also be permitted more variety, and more plainly prove what human intelligence, coupled with skilful perseverance, can perform in a department where it is a question of giving pleasure to millions by caring for, improving, and multiplying plastic forms of those lovely plants which Nature, even in the North, so generously offers us.

The popularity and importance of the pansy is well seen in the statement of Messrs. Bath, of the Floral Farms, Wisbech, who write that "For the past four years the average acreage of pansies grown has been about forty. These consist chiefly of the giant Trimardeau and Empress pansies. The largest number of pansies sent out from the Floral Farms in any one year was in April, 1894, when not less than one hundred and twenty thousand were forwarded to all parts."

Mr. W. Sydenham, the pansy and viola specialist of Tamworth, from his collection of two million plants, has sent me beautiful specimens of Mary Stuart, Pembroke, Miss Hannah, Kitty Hay, and others, to show what the viola has of beauty even in a cold and backward spring.

An interesting communication from Messrs. W. A. Burpee, of Philadelphia, gives the position of the pansy from the American point of view. They state that, "while the leading house in America in the introduction of new and improved forms of pansy, it is practically impossible for us, owing to our hot, dry summer and high-priced labour, to grow our own supply of seed. Each year our Mr. Burpee visits, not only the leading pansy growers in France and Germany, but also the specialists who are engaged in the development of the flower. We are enabled in this way to supply seed of the finest strains, and to secure all the latest improvements in size and colouring in advance of other houses, and frequently, by purchasing the entire crop of a new sort, to put it out in advance of its introduction in Europe. A notable instance of this is our President McKinley Pansy, which we offer this season. While we cannot raise these fine strains in sufficient quantities for our trade, a few small growers in the cooler New England States have developed quite fine strains. By sowing the pansy seed early in the fall, and wintering the young plants in cold frames, we are enabled to have flowers of the largest size and finest colouring during the early spring months. Seed sown in the open ground in the spring produce plants that flower freely all the summer, and when the cool, moist fall weather sets in the flowers increase in size and beauty of colouring. These plants can be trimmed back on approach of severe weather, and well mulched with well rotted manure will produce grand large flowers during the very early spring. During our ordinary winter flowers can be picked from plants in the open ground nearly all winter, if we have clear, warm weather, while in cold frames they bloom freely all winter unless frozen up tight. The smaller flowered strains of pansies bloom most freely during the hot, dry summer, but are soon surpassed by the large flowered when the weather is cool and moist. The bright reputation of German pansies must be judged by these brilliant drawings sent out by the noted raiser, E. Benary, of Erfurt. These notes, however, might be almost indefinitely increased, and I do not wish to end with a weary thought. The paper began with a breath upon the Eildon Hills, with the chance finding of a pansy wildling; the making has found me many friends, without whom it hardly could have been written with any sense of final words. To Dr. Stuart, to Dr. Wittacck, Mr. Lynch, and Messrs. Barr, Dean, Grieve, Messrs. Bath, Backhouse, Benary, Burpee, and Sydenham, I owe my best thanks for the interest they have taken in my work, and these thanks I heartily give." EDWARD PEAKE.

CHRYSANTHEMUM NOTES.

Some Incurved Varieties.

THE following are some of the best incurved forms of recent introduction that have been seen during the present season, viz.:—*Miss Godsmah*, fine, deeply-built blooms, solid, compact, but rather coarse, inside of florets crimson, reverse golden-bronze. *Ada Owen*, a very pretty regular-looking incurved of good size, having stiff florets, which are close and compact and rather broad; colour pure white. *Major Matthew*, a pretty little flower with narrow florets, of good depth, globular in form, colour pink. *Yvonne Desblanc*, very large variety of French origin, pure white; and *Topaze Orientale*, one of Calvat's, very deep in build with numerous closely incurving florets, and the colour pure pale yellow. *Emile Nonin*, rather flatter in build than some, but of value on account of its colour, which is a deep golden chestnut.

In *T. Lockie* we have something in the form of Mrs. R. C. Kingston, very close in build, with very regular, narrow florets, white tinted yellow; outer florets shaded pink. *John Miles* is another whose build leaves little or nothing to be desired, colour golden orange-bronze, recently certificated.

The following are not yet in general cultivation:—*Thomas Singleton*, a closely-incurving and compact flower, pure white but the outer florets tinted. *C. S. Bates*, a deeply-built very regular flower, large in size, and of a pure golden chrome-yellow. There is also *Pearl Palace*, a rather promising variety, colour pinkish lilac; and another called *Mrs. W. C. Egan*, very deep and solid, colour pink.

Varieties for Cutting.

Even so late as the middle of November there was in many suburban gardens and nurseries a capital display of many of the early-flowering varieties in the open border. Most of them are, of course, small in size when compared with what we see at the parks and shows, and in trade displays, but they are none the less valuable, and I have been much interested in seeing the pleasure with which friends who are not *fin de siècle* chrysanthemum specialists have accepted an occasional bunch, and the long time they last when kept in vases and other vessels in rooms. Freely grown and flowered with this object in view the reward in such a season as the present is great, and amongst some of the most striking Harvest Home, Orange Child, and the old Roi des Précoces need no recommendation. Only a week ago I saw some plants flowering in profusion of Mdlle. Eulalie Morel, a pretty golden salmon coloured Japanese; G. Menier, rather tall, colour pale rosy amaranth; Ivy Stark, a pretty delicate little Japanese, with narrow florets of golden bronze; M. Dupuis, Japanese, flat florets, deep golden bronze; Mdlle. Marie Massé, rosy pink, very full; Albert Galy, bright reddish crimson; Ambroise Thomas, Japanese, with long florets, a fine deep crimson; O. J. Quintus, pink; Mytchett White, Samuel Barlow, and several others.

In the sick room there are few flowers more cheerful or more lasting, and just now more acceptable, than a bunch of chrysanthemums if the colours be well selected. The pinks, yellows, bronzes, purples, and crimsons are best, leaving the white varieties as much out of the number as possible, as that colour is likely to produce morbid thoughts in the mind of a person lying ill. Only a few days ago I received a box containing Crimson Pride, Madame Aug. Nonin, lilac mauve; Nellie Brown, golden bronze; Mdlle. Mélanie Fabre, pink; M. Dufosse, golden yellow; Triomphe de Lyon, bright rosy mauve; Madame de Sabatier, Mytchett Beauty, Martinmas, and Crimson Source d'Or, all very pretty and useful sorts for such a purpose. C. HARMAN PAYNE.

SOME INTERESTING PLANTS.

Crinum zeylanicum.

A RECENTLY imported plant of this species is now flowering here. It produces fully a dozen light glabrous green leaves, two and a-half feet long, three inches wide at the base, with scabrous margins, a purplish-coloured scape thirty inches high, bearing a dozen sessile, sub-erect flowers, closely packed together, so that the segments of adjacent flowers overlap each other. The segments are recurved, three and a-half inches in length by three-quarters of an inch in width, white in colour, with a deep crimson band extending from the tip to within one inch from the base on both surfaces. The tube is four inches in length, and is coloured crimson, as also are the style and filaments. The flowers, half of which are open at the same time, possess a sweet fragrance when they first open, but it is not so agreeable after a day or two; they only last for a week in stove house temperature, but if removed to a cooler and drier house they keep in condition for ten or twelve days.

C. zeylanicum requires plenty of water and a stove house temperature when growing, although, as may be inferred from its wide distribution over tropical Asia, Africa, and probably America (from whence this plant was imported), it is of considerable hardihood, and may be grown much cooler with success. The bulbs may be rested during winter in a temperature of 50 degrees, keeping the soil but moderately damp. There is but little difference between the flowers of this species and C. fimbriatulum (which has also just flowered here); the leaves, however, are very distinct, those of C. zeylanicum being recurved and radiating, whilst those of C. fimbriatulum are sub-erect, distichous, and spirally arranged.

Maurandya scandens.

This is an excellent climbing plant for the cool greenhouse, bearing simple palmate leaves, from the axils of which spring solitary, purplish-crimson, gloxinia-like flowers two inches long, the spreading limb of the corolla measuring an inch across. There are two rows of tufted yellowish hairs extending to the base of the tube. The green inflated calyx and the seed pods resemble those of the Cotton (Gossypium). It continues to flower and lasts in good condition for a considerable time if the seed pods are removed as soon as formed. It is a plant of easy culture, making growths from eight to ten feet in length, which are most effective if allowed to depend from the roof. The coloration of the flowers varies somewhat in seedling plants. The species appears to be quite uncommon in gardens.

Eranthemum Andersoni.

A small shrubby plant producing broadly lanceolate leaves six inches long, and terminal spikes of about forty white flowers, about an inch across, the lower petal of the whole being spotted with crimson in a manner suggestive of some orchids; the two stamens are curved upwards and much resemble the pollen sacs of some orchids. It requires a warm greenhouse temperature, and is worthy of a place in any collection of warm greenhouse flowering plants, the flowers possessing a peculiar charm, and lasting a month or two in good condition. It grows best in a compost of two-thirds loam and one-third peat, potting very firmly; cuttings of the young shoots taken off in spring make nice plants for early winter flowering; they root best in a mild hotbed under a bell-glass.

Hymenocallis eucharidifolia.

This is a very handsome stove house species of Hymenocallis; it bears a stout scape of flowers, resembling those of a small form of H. speciosa. There is so great a similarity in the flowers of some of the broad-leaved species that it is by no means easy to determine one from the other, which may account for the confusion now existing in the nomenclature of these plants in the gardens where they are grown. The leaves also are very variable, being largely influenced by the district from which they were imported. Those in the present case are alternately arranged around a short, stout stem, composed of the sheathing bases of the petioles, and measure a foot in length by eight inches in width, some leaves being nearly as broad as long. The petioles are very short and stout, in some instances almost wanting; it is a compact, sturdy-looking plant, and may be treated in the same manner as H. speciosa. The flowers are deliciously fragrant, of great value for cutting; the plant itself when in flower may be used for indoor decoration, as the flowers last a week or two in good condition.

Isleworth. GEO. B. MALLET.

Road Sweepings as Manure.—This material certainly does contain, from gravel or macadamised roads, full 50 per cent. of gritty matter, little of which may have manurial properties, but the other consists chiefly of horse-droppings, and is in that respect good manure. All the material is of great value to incorporate into stiff soils, and for such purposes seems to be too seldom utilised. Still, it makes good manure for light soils, as I have seen ample evidence of on the Richmond allotments, where large quantities of it are used by the allotment-holders yearly, and they, especially when they cultivate deeply, obtain capital crops. I am having such material, got at a trifling cost, carted on to plots at Richmond and Surbiton, feeling assured from what I see on every hand that an occasional good dressing of it, especially when it has lain for a few months and partially fermented, to be excellent manure.—A. D.

Blackened Potatos.—That potato tubers should sometimes not only boil black in flesh, but should also blacken very much when even but moderately bruised, is a matter with which growers have long been familiar. But they have never yet had explained why it is that on the same soil some varieties habitually blacken, whilst others very much like them never do so, but produce clear-fleshed tubers. There must be in these varieties some chemical difference to cause this diversity in the flesh. I used, when in Middlesex, to grow a remarkably fine kidney that became well known—Chancellor. It was a Magnum Bonum seedling, but the tubers from the Middlesex soil used to blacken when cooked, and rendered it useless to grow as a market variety, although so fine a cropper. Oddly enough, Prime Minister, from the same seed apple, and, of course, parents, very much like the other in growth, never blackened. I found that in Berkshire Chancellor tubers never blackened when cooked.—A. D.

CHRYSANTHEMUMS.

VAGARIES AND INFLUENCES OF THE PAST SEASON.

Now that the rush and bustle of the shows is past we may take breath, and with some degree of profit review what has resulted from our labours among chrysanthemums under the influence of the most abnormal season experienced for many years. Very few growers, I feel sure, will disagree with the statement that our disappointments have been above the average (we always look for some), and these have followed on the almost universal promise of exceptionally fine results.

Never before has the fact of peculiar seasons bringing out the best qualities of certain varieties, and at the same time showing an adverse effect upon others, been more strongly emphasised than during the past year, and those of mature (if this expression be allowable) experience know full well that we must not too freely discard those which have failed, nor place too much reliance on those which have behaved so well. It has been a season when calculations have been often upset in bud selection and timing, and consequently note-taking of various doings and results of 1898 will mostly be more interesting as a matter of history than useful as data upon which to base our treatment for another year.

The absence of sunshine and the low temperature of the late spring and early part of summer compelled us to protect plants with frames longer than usual, and this treatment seemed to induce an earlier formation of the "break" bud in several varieties. In the case of some which were stopped early in April the shoots made rather more rapid progress, owing to the continued protection, than we have noticed in other seasons, when at the corresponding period the plants have been fully exposed. Consequently buds formed a little earlier than we expect them to do in an ordinary season on a few kinds, but curiously the subsequent heat and long-continued dry weather seemed to exert a contrary influence, and some which we usually have too early came later, and were longer than usual in developing their flowers. This tardy development was a pretty general experience in the South, and proves that our pet theory of ripe wood may be nursed too much, though it may be that only one such opportunity will occur in a lifetime of testing how much sunshine and dry atmospheric conditions can be overdone. "If we could only have known," is a vain regret, but there is good reason to believe that had "Queens," for instance, been partially shaded after the third week in August, we should have had more good blooms, for very few indeed were the typical flowers of this family which came under my own notice at the various shows.

The later additions to the incurved section have doubtless been the mainstay of the exhibitor during the past month, and, as many of these are much in the way of Japanese in habit of growth, we may assume that the season has conclusively proved that the old type of incurves do not succeed so well in a hot season, that is, they do not produce their most perfect blossoms on hard, or, as it is generally termed, well-ripened wood.

Failures amongst Japanese varieties were common, though not so bad or complete as many growers anticipated early in October. Madame Carnot was a great offender; almost everyone lost buds of this, and men, too, who were not guilty of overfeeding. In various localities the same complaint arose that buds on plants in small pots, as well as large ones, buds taken in mid-August and at the end of the month, equally succumbed to the excessive heat. One grower wrote me that all his Carnot buds were gone, excepting on two plants, which were partly shaded by some runner beans. This was the first discordant note of the season; then followed others; Simplicity, Lady Byron, Duke of York, and a few more followed suit. Later on, when plants were housed, hard centres to the buds was the story told, and though foliage and buds both appeared to be in fine condition ultimate development was too slow and erratic; lots of growers began to fidget and almost wish for the time to come when they could be getting to work at their cuttings for another year. One large grower wrote: "from three dozen plants of Viviand Morel, Charles Davis, and Lady Hanham I shall hardly get three good blooms." An amateur friend told me that he had carried about 7,500 gallons of water to his plants, which were the most promising he had grown, and yet half of them were failures.

To the uninitiated these "sidelights," as it were, might appear very discouraging, but we very seldom find they are so—certainly not to the earnest cultivator. The lukewarm may despair (and these would never shine or succeed under any conditions), but not the enthusiast. The brighter side of 1898 has been seen in the fine productions of Oceana, Mrs. Weeks, and Mons. Chenon de Leche, probably the three varieties above all others which have been most consistent throughout the country. Fine flowers were shown in Edinburgh, as in London, and they represent grand types. Madame Ph. Rivoire, Mutual Friend, Edith Tabor, Phœbus, Mrs. W. H. Lees, and Lady Ridgeway have also done well, though in some cases better than others.

The Scotch growers have this year surpassed themselves, and I believe I am quite safe in saying that never before have such fine blooms been grown in the North as those represented in the principal exhibits at the Edinburgh Show. True, their season has been more genial, and is admitted on all hands to have been very favourable; but it must be equally true also that the finer details of cultivation are now better understood, and doubtless the determination was abroad amongst Scotsmen that the leading prizes should not go south of the border without a big effort on their part to retain them, and right well have they succeeded. Lady Ridgeway was shown better than I have ever seen it, and such a charming tone of colour. Pride of Madford, with petals naturally drooping, was very fine. Mrs. Weeks, Simplicity, and Chas. Davis were splendid amongst well-developed blooms of the best kinds, and the grand display of these noble flowers, shown in vases with their own foliage, has not been surpassed.

Many of last year's introductions have proved remarkably good, and will doubtless be largely grown another year. The novelties presented to the Floral Committee, too, have been of a very promising nature, and good ones have failed to obtain a certificate owing to the high standard of excellence displayed. Readers have been made familiar with these through the published reports of meetings, but the list may be repeated at an early date to ensure the good things obtaining the popularity they deserve. Many valuable additions have been made to the list of early-flowering decorative varieties suitable for flowering in the open border, and though the recent fine autumn may mislead us a little, no one can go far wrong in planting a good number of these beautiful autumn flowers. Long after the Michaelmas daisies were over these border chrysanthemums gave us a splendid show, and they fully deserve a border to themselves in every garden.

Trent Park Gardens. W. H. LEES.

AUSTRALIAN CHRYSANTHEMUMS.

THAT the chrysanthemum growers in the Antipodes have long been interested in the raising of new seedlings is common knowledge to most of us here in the old country, and on numerous occasions the fact has been alluded to in the pages of the GARDENERS' MAGAZINE. Some of these colonial varieties, like Oceana, Pride of Madford, and Australie, are well known for their massive build and substantial dimensions, and have evidently come to stay. During the present season many new additions have been met with at the trade exhibitions, and the older ones have merited the high opinion already formed of them. The following list gives the names and descriptions of the best of those seen this season, and the only cause for regret is that the dates and raisers' names cannot be furnished. Mr. Pockett, however, of Melbourne, is probably responsible for several. He is an enthusiastic cultivator and raiser, and is the author of a little treatise on the cultivation of the chrysanthemum, which was specially written for the Victorian Horticultural Society some few years since.

Australian Belle—Japanese, with very long tubular florets; colour deep rosy-pink. *Mrs. C. Bown*—A Japanese of good size; colour white. *Purple Emperor*—A very fully-formed, deep, compact flower of the Japanese type; florets medium sized and grooved; the colour is a beautiful velvety shade of plum-coloured purple, reverse silvery; not large, but most effective in appearance. *Chatsworth*—Japanese, with very long, narrow, drooping florets, forming a deeply-built flower; colour white, streaked pinkish-purple. *Mr. T. Carrington*—A worthy companion to Australie and Pride of Madford; very massive Japanese incurved, with long, medium-sized florets, grooved and pointed; colour deep bright purple, reverse silvery pink. *The Convention*—Japanese incurved, with long pointed florets; a globular flower; colour deep golden terra cotta, lined with bronze inside. *Mrs. G. A. Haines*—Japanese; striking, but rather small; rather broad incurving florets; colour golden bronze, reverse gold. *Mrs. J. T. Tibbs*—A white sport from Lilian B. Bird, raised in New Zealand. *Mrs. H. B. Higgins*—Very large Japanese; medium-sized florets; a fine flower; colour very delicate creamy white. *Miss Mary Underhay*—One of the best Japanese incurved; medium-sized florets, grooved and incurving; colour a rich shade of buttery yellow. *Euterpe*—A short-petalled Japanese; the florets are pointed, grooved, and rather broad; rosy mauve, with a reverse of silvery pink.

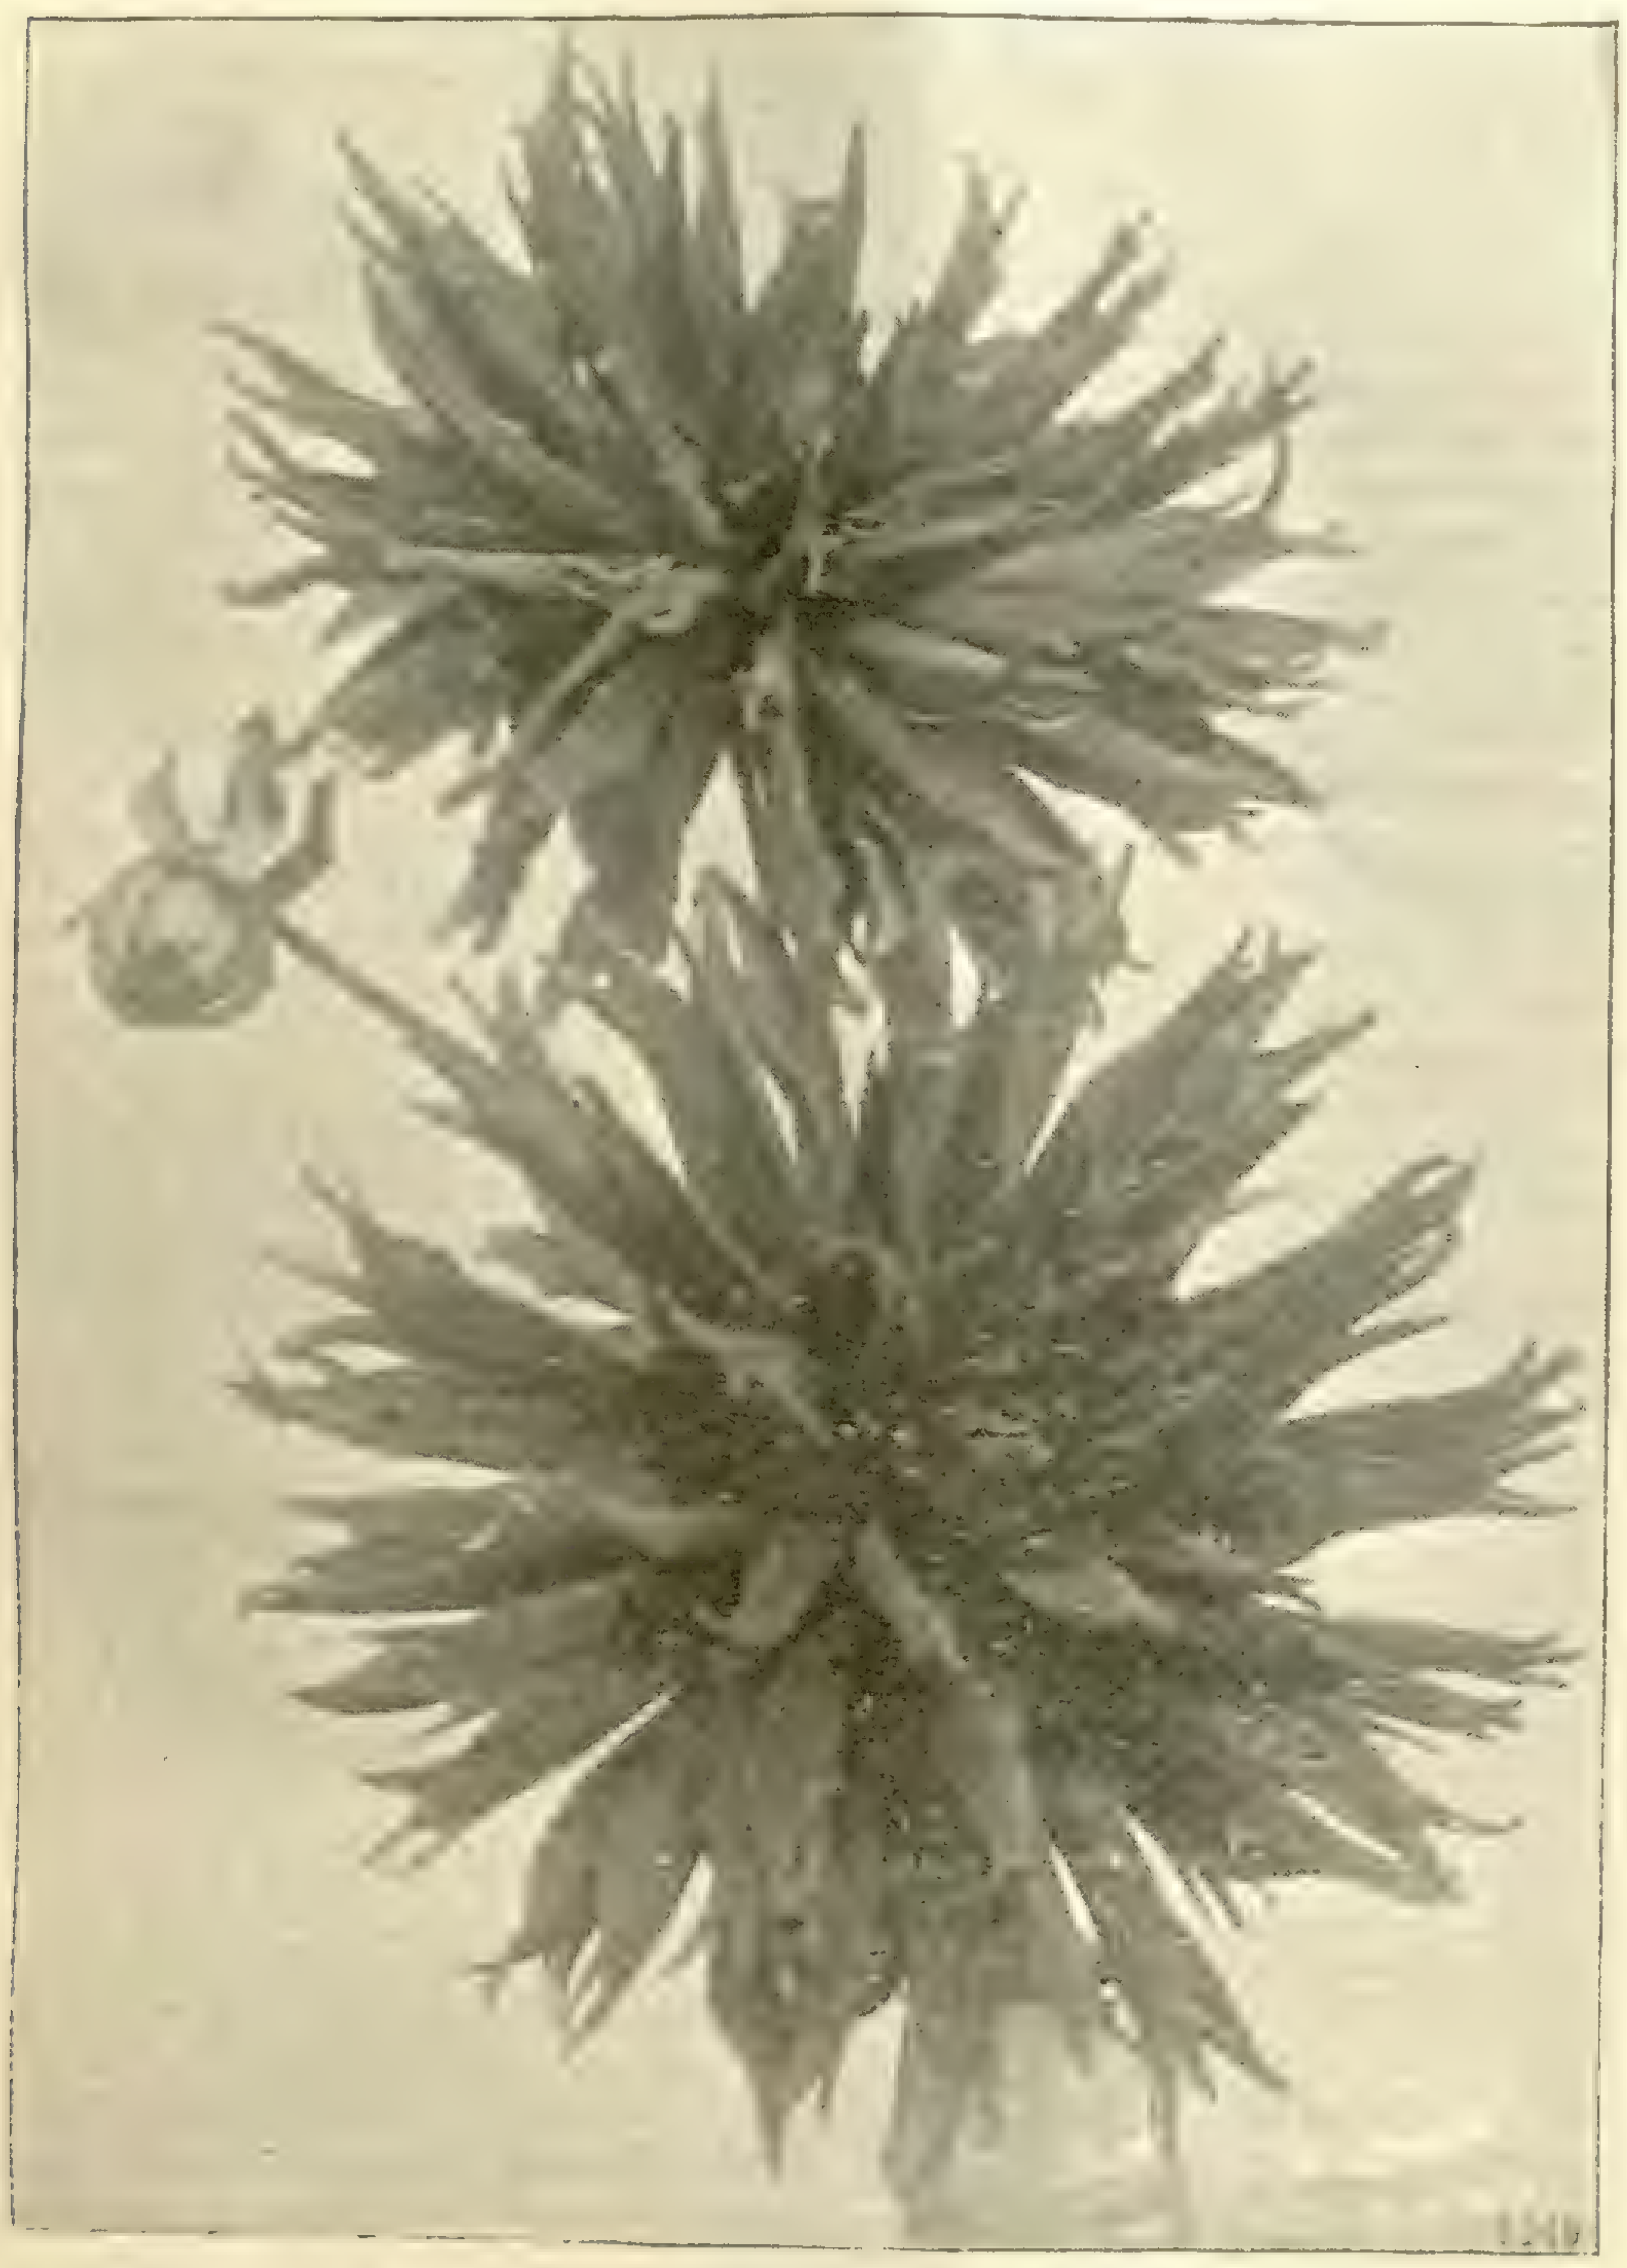
Miss Nellie Pockett—Very pretty, Japanese, with very narrow incurving florets, grooved and pointed at the tips, closely built; colour pure glistening white. *John Pockett*—A deeply-built Japanese incurved, with rather broad florets; a very rich shade of deep golden brown or chestnut, reverse gold. *Pride of Madford*—One of the biggest, too well known to need description. *Australie*—The same remarks apply to this one. *Pride of Stokell*—A sport from Pride of Madford; colour deep velvety crimson, with golden reverse. *Mabel Kerslake*—Probably a synonym of the preceding, being a crimson sport from Pride of Madford. *Wonderful*—A Japanese incurved, of the Wheeler type; broad florets; colour velvety purple-crimson, with straw reverse. *J. Bidencope*—If not actually of Australian origin, it is at any rate named after an Australian grower; a purple amaranth Japanese, with silvery reverse. *Mrs. Bissett*—Japanese florets, slightly incurving, good size and form; colour white, slightly tinted. *G. Kerslake, Junr.*—Very long florets, a Japanese; colour white. *Miss Vera May Fouser*—Japanese incurved, broad grooved florets; very fine shade of warm terra cotta, reverse golden. *Master H. Tucker*—Japanese; colour deep velvety bright crimson, reverse golden. *Oceana*—A fine, well-known yellow. *Mrs. H. Briscoe*—Japanese of large size, very long florets; colour bright rosy mauve, silvery reverse. *Beauty of Adelaide*—Japanese, with great length of floret; colour dull rosy pink. *Mrs. Ernest Carter*—Japanese of fine form; long, closely arranged, drooping florets; colour pretty pure shade of deep primrose.

C. HARMAN PAYNE.

Marguerite Leaf-Miner.—We have had some difficulty in cultivating marguerites for some years past, as leaf-miners (*Tephrites*) are very plentiful here on the holly and other plants, though strange to say the celery has escaped attack for many years. The marguerites in pots nave been so severely and repeatedly attacked that without a remedy we cannot grow them to be of any use. An effectual method of prevention, however, has been found in the use of a mixture of soft soap and petroleum—soft soap, two ounces; water, one gallon; and a wineglass of petroleum, is the recipe. The mixture is kept close to where the marguerites grow, as it is then more likely to be applied regularly. It should be used every day to get rid of the fly, and then the most persistent attack will ultimately yield, and the plants will become clean; it may take several weeks to accomplish this, but victory is certain to follow. The large white marguerite is a good winter bloomer, and spring struck cuttings grown on make fine winter flowering plants. The yellow varieties are not winter bloomers to the same extent, but are splendid for summer for cutting from when planted out in the open. —GEORGE HARRIS, *Alnwick*.

CACTUS DAHLIA PROGENITOR.

THERE are a number of dahlia growers and enthusiasts who consider that the dahlia has by no means yet given us all the diversities of form and gradations of beauty it is capable of producing. Such an opinion coming from those who make both a hobby and business of raising new varieties of dahlias is well worthy of consideration, especially when it is backed up by specimens which one instinctively feels are the progenitors of new and distinct classes. Mr. Wyatt, proprietor and manager of the firm of Messrs. Keynes, Williams, and Co., Salisbury, has been as energetic in the cultivation and production of dahlias as he has of roses, and the results of his efforts have been seen in very many excellent dahlias, both of cactus, pompon, and show forms. Each year has brought us new colours or shades, and some seasons new forms also, as in the case of Arachne and The Clown, and even more markedly in the case of Progenitor, the variety figured in the present issue. This form has the general characteristics of the cactus dahlia, and in addition the twisted florets are much divided at and near the apex in a most peculiar and yet pleasing manner; the colour is rich and bright scarlet. The name, Progenitor, could scarcely have been improved upon, for, unless we are very much mistaken, it is the commencement of a class that will run the Japanese chrysanthemum very close for elegance, grace, and beauty. Wherever exhibited, at Shrewsbury, Crystal Palace, Royal Aquarium, and the Drill Hall, Progenitor has been greatly admired for its own beauty, and for the promise it contains of further developments. It has gained an award of merit from the Royal Horticultural Society.



NEW CACTUS DAHLIA PROGENITOR.

A Few Good Apples.—At the York Chrysanthemum Show I carefully examined a collection of about one hundred dishes of apples, mostly of very fine samples, from Messrs. Backhouse and Son, and a few points gleaned by questioning the grower may be worth recording. First of all Annie Elizabeth was one of the brightest and most showy cooking apples on the table, and very large fruit. Our experience of it on the standard is that it is a very shy bearer, but I was assured that on the Paradise stock, either as bush or pyramid, it crops freely, and is a fine late keeping apple. Blenheim Pippin is generally considered a shy bearer for the first ten years at least, but on the Paradise stock it crops freely on young trees. I noted the following six dessert apples that are not grown so much as they deserve to be: Claygate Pearmain, Golden Reinette, Lord Burleigh, Brownlee's Russet, Mannington Pearmain, and Barnack Beauty, the last-named a heavy cropper; all these are worth a trial. Two years ago we planted Colonel Vaughan, a small, red-striped apple, and one commended in the south as a good market fruit. This summer the tree was very heavily cropped, and produced nice fruit, but not of the highest flavour, though it is still a desirable kind, and promises to be a heavy cropper in the northern counties. Lord Derby promises to be a fine kitchen apple here.—GEORGE HARRIS.

CORDON GOOSEBERRIES.

AMONG small fruits the gooseberry ranks as one of the most useful, luscious, and accommodating; it is very hardy, and will thrive equally as well in the northern parts of Britain as in the south, and probably in hot, dry seasons, notably in 1898, the fruit will be better flavoured and last longer in perfection in the counties north of London than in those south of the metropolis. The season of the year has arrived for the formation of new plantations, and I propose in these notes to record the methods adopted in these gardens in the cultivation of gooseberries as cordons. Some of the advantages that will accrue from this system are neatness, ease in pruning, gathering, and protecting the fruit from birds and wasps, the prolongation of the season in which ripe fruit may be gathered, and last, but not least, the ease with which the various insect pests may be held in check. I am convinced also that finer and better flavoured fruit can be produced on cordon trees than on those grown in the orthodox way, *i.e.*, as bushes.

The gooseberry will thrive in any good garden soil, provided the subsoil be of an open, dry nature; if the cultivator has to deal with a cold, wet, retentive soil, it will be advisable to drain it. In old gardens that have been under cultivation for a great number of years I find the cordons are somewhat liable to die off suddenly, which gives the trellis a patchy appearance, this being most noticeable in trees that have become aged. I advise in such instances replanting every ten or twelve years, and, if possible, in a new situation; if this is not practicable remove the exhausted soil, replacing it with good loam, as in this medium it is very seldom a gooseberry dies if proper attention is afforded. The situation must be an open one and well exposed to the sun's rays. The position our trellises occupy is an open one in the kitchen garden, where they form a background to the herbaceous borders; no better position can be given them than this.

Planting may be performed at any time from the fall of the leaf until the month of February, but the earlier it is done the better, for several reasons. The trellises here are one hundred and fifty feet in length and five feet in height, with wires placed six inches apart. If two strong posts be placed at either end for straining the wires to, lighter posts of iron will answer well for the remainder, and these should be inserted at distances of ten feet apart; indeed, the required number of posts may be of iron if desired. The whole should be well painted and dried before planting. A suitable distance at which to plant is one foot apart, making the soil firm and afterwards tying the rods neatly to the wires. If any difficulty is experienced in procuring young cordon trees, those usually advertised will answer the purpose if the side branches are pruned back to within two inches of the main stem, leaving the strongest shoot as a leader, also taking out any growths at the bottom of the main stem, so as to ensure a clean stem free from suckers.

Careful attention to watering during the season of growth will be necessary, for if allowed to become dry at the roots red spider will soon be very much in evidence, and, should this pest once obtain the upper hand, it will be difficult to eradicate. An occasional watering with farmyard liquid will be very beneficial, and a heavy mulch of manure or spent mushroom bed refuse should be applied early in the summer, this tending to conserve the moisture and keep the numerous surface roots cool. The side growths should be shortened twice during the growing season.

The winter pruning of the gooseberry may be performed soon after the fall of the leaf, for it is seldom that birds attack the buds of our trees, for a good syringing with quassia compound or spidacide, followed by a dusting with lime, will make the buds distasteful to them. The spur system of pruning is practised, cutting back each shoot to within three or four buds of the previous year's wood. The whole of the prunings should be collected and burnt. A good mulch of manure should then be forked in, but on no account should a spade be used for this operation.

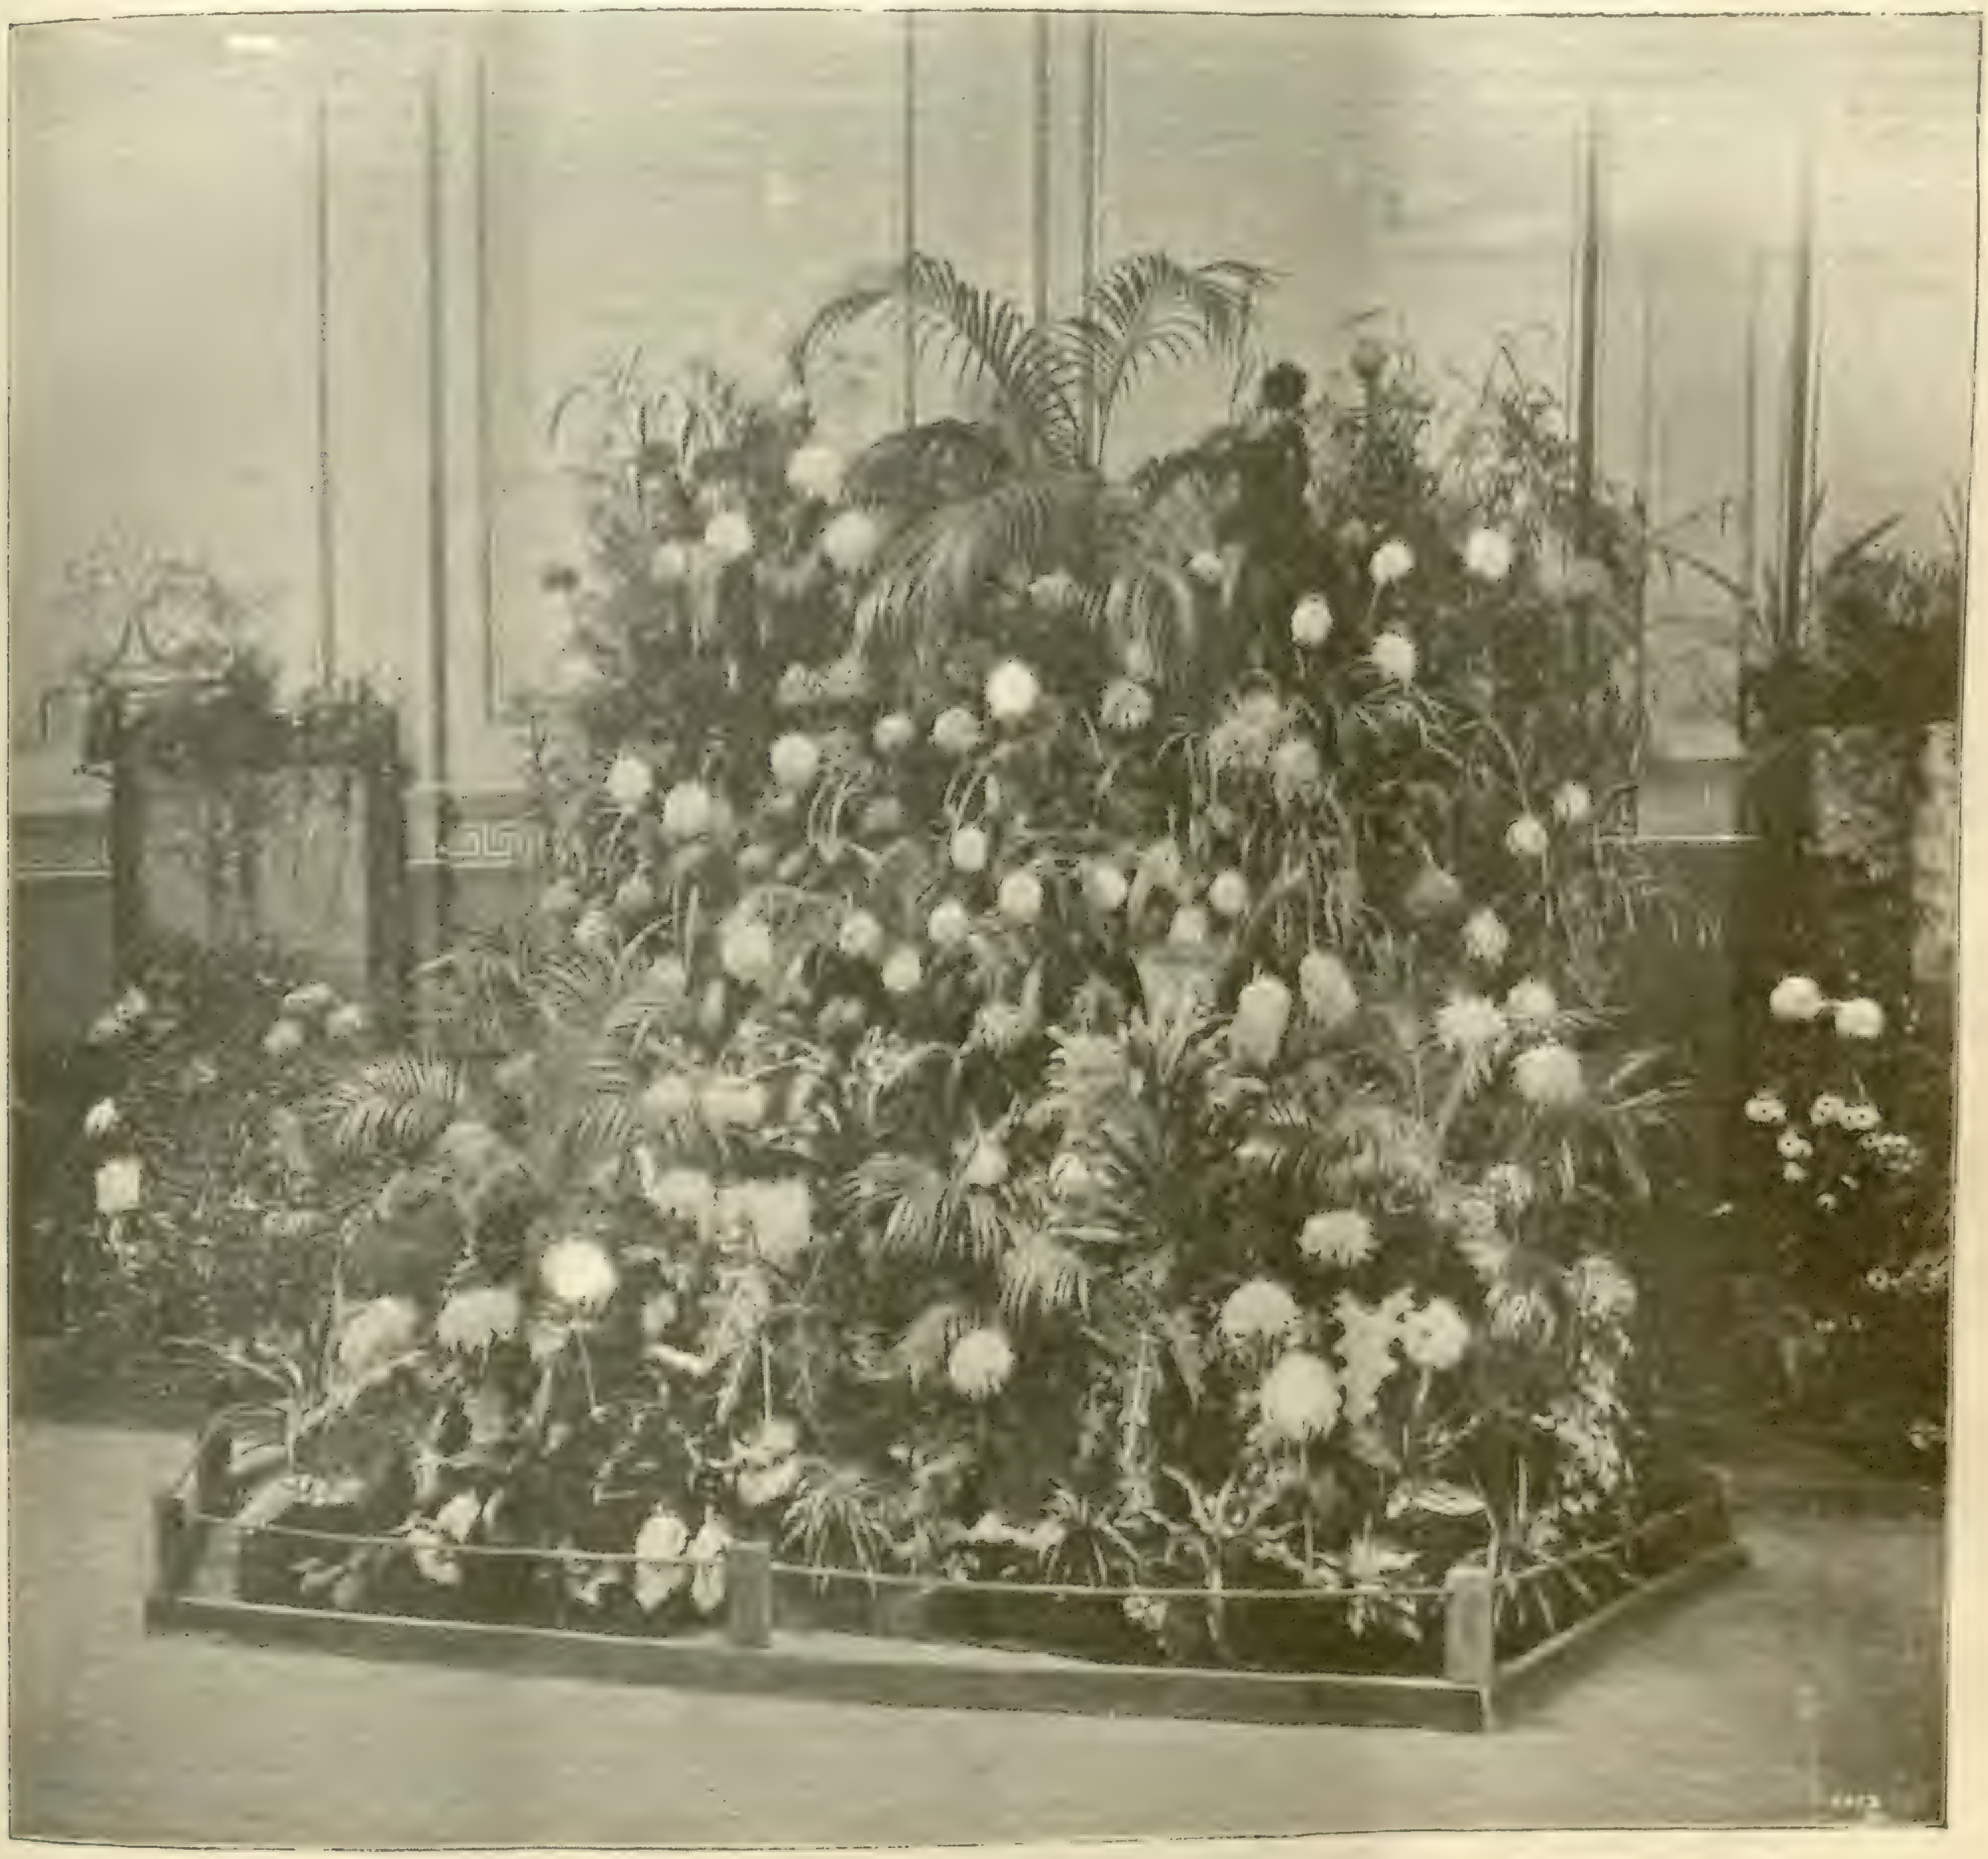
It is somewhat difficult to say which of the two most formidable enemies to the gooseberry is the worst, viz., red spider or gooseberry sawfly. In dry seasons the former will be sure to put in an appearance, and strong measures will have to be adopted to keep it in check. We find that if the hosings or syringings be frequent, and done with determination early in the season—*i.e.*, as soon as the trees break into growth—few insecticides will be needed, but an occasional syringing with an approved insecticide will act as a preventive early in the season, but if given later the fruit may be flavoured with it. Prompt measures must be taken with regard to the sawfly grubs, as they will devour the leaves, with the exception of the petiole, often defoliating the trees. When full grown these pests descend to the ground and change into pupæ, from which another brood of sawfly emerges. Hand-picking is the most effective remedy, going carefully over the trees every morning. Sprinkling the trees when the dew is on them early in the morning with soot and lime alternately will be beneficial. Also removing the surface soil entirely in winter to about two inches deep, burning it, and replacing with fresh maiden soil is a preventive measure.

The supply of ripe gooseberries may be prolonged considerably by planting some trees against a wall having a north aspect, and covering them with a double thickness of fish netting, as in ordinary seasons fruit fit for dessert may be gathered as late as the end of October. Suitable varieties for this position are Pitmaston Greengage, Warrington, Coe's Late Red, and Viper; whilst for early use on trellises such varieties as Champagne, Whitesmith, Whinham's Industry, Golden Drop, and Crown Bob cannot be surpassed for general excellence.

Stoneleigh Abbey Gardens. H. T. MARTIN.

A TASTEFUL CHRYSANTHEMUM GROUP.

NOTWITHSTANDING all that has been written with reference to the arrangement of exhibition groups of chrysanthemums and other plants, there is much room for improvement, as collections arranged for effect continue to form a somewhat weak feature at a considerable proportion of the exhibitions, and thereby to fail to contribute their full share to the attractions and usefulness of the respective gatherings. The causes of the groups being less satisfactory than they should be are not difficult to determine. In many instances they fail to satisfy those imbued with some degree of artistic perception, because of their being limited wholly to chrysanthemums, and for this the societies must be held responsible. On the other hand many exhibitors fail to produce a tasteful arrangement in consequence of their assuming that a great mass of colour is essential to artistic effect, and crowding the largest possible number of plants in the prescribed space. In not a few cases at least one-third more plants are used than are required, and it would be an immense advantage if exhibitors generally would reduce the number of plants used by the exclusion of those having blooms of indifferent quality. Not less desirable is the general use of plants with ornamental leaves, and it would be an important advance were societies to require the association of fine foliage plants with chrysanthemums in groups "arranged for effect." This may on the first impulse be regarded as imposing an additional tax upon competitors; but there are few exhibitors of chrysanthemums who would not be able to provide two or three palms, dracænas, and crotons for their groups without any great difficulty.



MR. G. WILSON'S FIRST PRIZE GROUP OF CHRYSANTHEMUMS AND FINE FOLIAGE PLANTS, HULL.

From a very early period in the history of the Hull Chrysanthemum Society chrysanthemums and plants with ornamental leafage have been shown together, and with such highly successful results that the groups at Hull have for some years past been considered, and properly so, the most beautiful arrangements that are presented to public notice in the United Kingdom. It has been not less a pleasure than a duty to refer in highly appreciative terms to them on several occasions, and I have illustrated some of the best for the purpose of showing the style of arrangement of those attaining the highest honours in the competitions, and thus assisting readers who are desirous of breaking away from the stereotyped style so common at exhibitions. With the hope of affording still further assistance in this direction I give herewith an illustration of the group for which Mr. G. Wilson, gardener to Sir James Reckett, Bart., Swanland Manor, Brough, worthily received the premier award in the class at the recent exhibition. As will be seen from a glance at the illustration, the chrysanthemums are lightly arranged amongst the palms, crotons, dracænas, and alocasias, and the whole of the blooms are of exhibition quality, the effect being surprisingly rich and extremely tasteful. At Hull the groups have to be arranged the day previous, and the practice is one that should be generally adopted, for it is extremely difficult to arrange a large group satisfactorily when, in accordance with the usual practice, it has to be done on the morning of the opening day.

To the right and left of the group are two of the drawing room mirrors which constitute such a pleasing feature of the exhibition at Hull, that on the right being the arrangement which obtained premier honours. The society provides mirrors with plain frames, and the exhibitors are allowed full scope for the display of their taste, the only condition being that the plants in front of the mirrors must be arranged in a semicircle, with a depth of about two feet. The height of the mirrors is about six feet, a fact of interest as indicating the height of the group.

G. G.

WORK FOR THE WEEK.

WARM ORCHIDS.

There has been a change in the weather since I last wrote, and now frost is beginning to trouble us. But cold nights on various occasions have been followed by warm ones, and such variations in temperature outside are bound to cause a certain amount of fluctuation under glass. Many amateurs are in the habit of driving the fires hard when there is a likelihood of frost, and causing the heat to rise to a degree that is bad for the plants. This mistake can easily be avoided by careful management and regulation of the fires according to the power of the boiler. The kind of fuel used is generally coke, some few using house coal; both of these are apt to cause fluctuations of temperature if not well managed. Coke, if kept well clinkered, will produce a tremendous heat, and house coal will produce the same if the poker is kept continually in use. Of the two fuels coke is preferable, but I would strongly advise the use of anthracite coal for orchid growing. It may prove a little more expensive, but that is compensated for by the saving in labour and a good steady fire.

During foggy weather such subjects as calanthes, Dendrobium Phalænopsis, and Lælia anceps must be carefully watched, and the houses containing them must be kept dry, while a little more heat should be afforded, especially towards evening. Dendrobiums of the nobile and Ainsworthi section that finished up early will most likely be in flower, and it is as well to bring on a few plants in warmer quarters, as such prove useful at Christmas time; the rest of the collection will now be in their resting quarters. The evergreen species, such as D. fimbriatum, must be placed at the warm end of the house and given very little water, just keeping the bulbs in a plump condition. The temperature should not fall below 55 degrees at night, rising in the day a few degrees higher. Suspended plants must not be kept nearer the glass than nine inches, thus allowing them to escape cold and draughts. Cattleya Percivaliana will have buds in the sheaths in many gardens, and must be placed at the warm end of the cattleya house and given a little more water than allowed the general collection. C. Mossiæ and C. Mendeli must be placed at the coolest end and near the glass; C. labiata must be well watched against the damping of bulbs that have recently flowered; place them at the warm end for a time, and allow only sufficient water to keep the bulbs plump, in fact a slight shrivelling will be a preventive of damping. C. superba must be given a few degrees more heat to keep it in a healthy condition. —T. Stafford, *Tyntesfield Gardens.*

STOVE PLANTS.

Dipladenias should now be resting in a temperature of 58 to 63 degrees, and very little water will be required, just sufficient to keep the roots from perishing and the wood from shrivelling. The earliest batch will not require to be started until January, and then will bloom in May. A minimum temperature of 60 degrees will be suitable for wintering ixoras, and very little water will be required at the roots; yet care must be exercised that the dryness is not carried too far so that the roots are destroyed. The resting of plants is a very different thing to the drying off of bulbous roots; the roots of the latter perish annually, so that when the growth is ripened the pots containing the bulbs or tubers may be stored away and receive no further attention until the season for starting them into growth comes round again. The resting of fibrous-rooted stove plants is quite another matter; when growth is completed they are placed in a lower temperature and water reduced at the root (not withheld), the object being to keep the plant in a dormant state, while the roots are preserved in a healthy condition; therefore, though the plants are resting, they must receive careful and intelligent attention, that when the season for active growth comes round again they may be in the best possible condition for making a strong and healthy start. These remarks apply to all stove flowering plants at rest. such as clerodendron, stephanotis, ixora, dipladenia, allamanda, bougainvillea, adhatoda, ipomæa, &c.

As the different batches of gesnera pass out of flower still afford them a light position not far from the glass, and continue to feed them until the foliage shows signs of ripening. when clear water may be applied at further intervals until it is eventually withheld altogether. Poinsettias, as the bracts become fully developed, should be removed to a drier house with a temperature about 55 degrees; continue to feed later batches until the bracts are almost fully expanded, but when watering these later plants see that the moisture permeates the whole ball, and that the water used is warmed: in fact, for all plants in warm house the water used for watering and syringing should be at about the temperature of the house. I was asked by an amateur the other day to account for some of his plants looking unhappy. I placed my hand in his water-tank and asked if he usually watered his plants from thence. Then I learned he sometimes had the tap running at the time he was using water from the tank; and as the latter was not placed near the hot-water pipes there was a difference of 15 degrees between the temperature of the water and that of the house. Success in plant growing is attained by attention to a multitude of small matters, and it is only those who attend to them who succeed. Do not syringe plants of Euphorbia jacquinæflora that are in flower, and afford them rather smaller supplies of water; E. splendens, though not frequently grown, is very useful during the winter months, especially to those who have to provide many buttonholes. Another recommendation in its favour is that it is very little trouble. Gardenias that have been moved to the stove to bring them on will require regular feeding and constant attention to keep them free from mealy bug. Plumeria alba may now be kept quite dry at the root, and alocasias and marantas will require very little water until fresh growth starts, but should not stand near the door where the cold air will strike them. Aeschynanthus should now be induced to rest by reducing the water supply; these make lovely basket plants, continue in flower during a long season, and always command attention by the brightness of their flowers, which, in different species, are crimson, scarlet, or orange. They may be raised in spring from cuttings of the half-ripened wood, about three inches long, removing all the leaves but the two uppermost; when rooted pot on as necessary until large enough to place in baskets.

Keep the atmosphere of the stove moist, syringing the plants once a day on dull days; on bright days twice. Where blinds are available let them down on cold nights, this will reduce the necessity for very great heat in the pipes, thus making the atmosphere healthier for the plants.—J. Tunnington, *Ripley Castle Gardens.*

THE FLOWER GARDEN.

Although the pruning of roses should, generally speaking, be performed in March and April, any very strong growths, especially of H.P. varieties, may with advantage be now somewhat shortened, which will prevent their being broken off by wind or snow, or the loosening of the plants in the soil. Where long shoots are to be retained for pegging down or on climbing or pillar roses, they should be tied or fixed in position temporarily before the advent of rough weather. Rose beds and borders, where lifting or renewal of plants is not necessary, should now have any rubbish or weeds there may be removed from the surface, and a good dressing of half-rotten manure applied as a top-dressing, which may also act as some protection against severe frosts should such occur. In the spring the remains of the manure may be lightly forked in, or a little fresh soil scattered over it. Brier stocks for next season's budding should be collected or obtained as soon as possible and planted in the reserve quarters for working. All rough portions of the roots should be trimmed away, retaining the smaller roots; the stems will also require some trimming and shortening. It will be advisable to make two lengths, one for standards and another for half-standards, some of the finest exhibition roses, especially teas, being produced on the latter; two feet in height is a suitable length for these and four feet for the former.

Where planting of deciduous trees and shrubs is contemplated the work should be pushed forward while the mild state of the weather continues. Although the rains have been slight to the present time, most trees and shrubs of moderate dimensions may be safely lifted as far as moisture at the root is concerned, but any that may be dry at the base should be thoroughly watered after planting. In making a selection for shrubbery borders and pleasure grounds it is well to bear in mind the autumn effects, which are so pleasing in some shrubs that are most effective flowering ones also in the spring and summer months. The brightest autumn tints this year have been found in the rich crimson, red, and yellow foliage of the hardy Ghent azaleas, and where the soil is moderately light and lime is not present these should be freely planted. The common yellow and orange-flowered varieties grow very quickly, and they usually attain the highest colour in autumn leafage. Many other shades of crimson, pink, and red are desirable in the flowers, and double-flowering varieties are now plentiful. The mollis section is equally hardy, although perhaps of rather slower growth. Other flowering and foliage shrubs should include the almonds, which are among the earliest to flower in the spring, and varieties of the double-flowering peach in crimson and rose shades. Lilacs in many varieties are now obtainable, as the dark purple Souvenir de Leon Spath, Marie Legraye, white; Leon Simon and Virginite, double whites; Jules Finger, double pink, and several others. Laburnums are handsome flowering shrubs, while several of the shrubby spiræas are also desirable, and mention may be made of S. Anthony Waterer, S. ariæfolia, S. Douglasi, S. confusa, S. Lindleyana, and S. prunifolia fl.-pl. A few other subjects will include the white and yellow brooms, including Cytisus Andreanus; several of the single and double-flowering hawthorns in scarlet, red, and pink shades; Philadelphus grandiflorus and P. coronarius; Prunus myrobalana fl. pl., and P. Pissardi, with its handsome purple foliage; Liquidamber styraciflora, the foliage of which attains very bright autumn colours, and many of the acers for summer effect, as A. palmatum, A. p. sanguineum, A. p. septemlobum elegans, the latter with foliage of a greyish green in early summer, changing later to a deep red. These are a few only out of the many subjects that may be selected. In planting make the soil about the roots thoroughly firm by well treading or ramming, and standards or other tall specimens requiring stakes should be made secure without delay.—C. Herrin, *Dropmore Gardens.*

HARDY FRUITS.

In my last notes I dwelt upon the importance of having all planting done as soon as possible, and that advice still holds good, for we have not had any severe weather to interfere with the work. To my previous advice I would add the importance of giving newly-planted trees a mulch to keep frost from the roots, as it will be found newly broken ground is quickly influenced by severe weather. For mulching I do not advise heavy, wet manures, but a light, porous material that excludes frost. There will be plenty of work now among the older fruit trees, and wall trees may now receive attention. With peaches and nectarines the work will not be great, if the advice concerning the removal of old fruiting wood was carried out, but even now arrears may be made good rather than leave the work to the spring. Much will depend upon how the trees are trained; if to wires, the small growths which are needed for next season's fruit should be untied, as by free exposure the flowering period is retarded, and the crop will be saved. In my opinion much more may be done to save crops by hardening the wood and retarding the buds than by covering them when in bloom. Trees trained to wires are frequently affected in severe weather; the bark is discoloured, and the next season canker will set in at the part which touched the wires. I am not in favour of wired walls, having suffered badly in the colder parts of the country from the cause noted above. Nailed trees should also have the young wood detached, and only the main supports left to hold the trees in position; the wood is then cleansed by heavy rains, and pests lodged in the wall do not obtain much shelter. It is also an excellent plan when the trees are at rest to syringe the walls with an insecticide; we use Bentley's Soluble Petroleum, and then are not much troubled. There should be no further delay in having these trees lifted where at all gross, and if any need new surface soil now is a good time to do the work, as by the removal of old surface soil now a certain amount of insect life will be destroyed.

As apricots flower early they may now be pruned, but, like the peach, with attention paid to stopping there will be little pruning at this season; on the other hand, much may be done by reducing the old spur growths, as these are often much too crowded and do not give any return, for the wood may be too weak to bear fruit, and this crowds the better growth. We find it a good plan to remove a portion of weak spur growth yearly, as this encourages a much stronger, cleaner growth. Apricot trees that have lost branches may be retrained, and this will often much benefit the trees, as by rearranging the branches to fill up the wall-space the wood receives more light and sun. Our best apricots, I mean the most reliable in our light soil, are the Hemskerk and Large Early; the latter will grow when others fail. The same remarks are applicable to apricots, concerning top dressings at this season, as advised for peaches, but here a richer material may be given. We use bone meal freely, with burnt refuse or old mortar rubble, and it will be found the nearer the roots are to the surface the better in every way. We prune and nail our trees at the same time, as these trees are the earliest to bloom, and there need be no delay in starting all kinds of pruning as soon as the leaves fall.

Fig trees on open walls repay protection in many parts of the country, as in severe winters they may be killed to the soil, and it takes years to build up new fruiting wood. Of course it will not be wise to do much pruning now, but I do not think there is any gain in leaving wood that may be in the way next spring. The fruit next year will be secured from the points of the new growths made this season, consequently these are the parts needing protection. To economise covering material we find it advantageous to untie the branches, draw them up into bundles of half a dozen or more together, and secure them to the wall. Many use hay bands or straw, I have never found a better protection than dry bracken, especially if it is cut in a green state and dried, as it is then very elastic and does not confine the wood too much. Many grow figs in pots and remove them indoors during the winter; this is a good mode of culture in localities where the fig does not fruit well on open walls. Such may now have the thin wood in the centre removed and the trees cleansed whilst in a dormant state; trees infested with scale will benefit by a good cleansing previous to covering.—G. Wythes, *Syon Gardens.*

EXHIBITIONS AND MEETINGS.

BANBURY CHRYSANTHEMUM SHOW, November 16 and 17.

ON the above date the Town Hall, Council Chamber, and the Court Rooms were each filled with an exhibition of very high quality, embracing groups and collections of stove and greenhouse plants, primulas, &c., &c., the show being opened by the Hon. Mrs. Brassey, Heythrop Park, in the presence of the Mayor and the chief officials of the town.

The prize for the best arrangement of decorative winter plants and flowers went to Mr. Bush, gardener to F. J. Myers, Esq., Charlton; Mr. Turner, gardener to the Rev. F. W. Cartwright, Aynho Rectory, leading in the classes for three specimens each of pompons, Japanese, and mixed forms; Mr. A. E. Kirtland, gardener to the Rev. R. F. Dale, Bletchington Rectory, taking the first card for three incurved. The groups arranged for effect displayed any number of good flowers on dwarf plants, but they were a trifle formally set up. Mrs. A. Coleman was awarded the premier prize, as also the certificate of the National Chrysanthemum Society; Miss Gillett second. Great interest centred in the cut blooms, which filled the centre of the hall. For twenty-four Japanese Mr. Daniells, gardener to Colonel Norris, secured the card for a grand lot, the varieties being Madame Carnot, Viviand Morel, Mons. C. de Leche, Mrs. G. W. Palmer, Modesto, Lady Hanham, Sunstone, N.C.S. Jubilee, Phœbus, Australie, E. Molyneux, Duchess of Wellington, C. Davis, Simplicity, Western King, Beauty of Teignmouth, Madame E. Rogers, Duke of York, Thomas Wilkins, Mrs. H. Weeks, Oceana, Graphic, Yellow Carnot, and Madame T. Rey; Mr. R. Jones, gardener to C. A. Smith-Ryland, Esq., Barford Hill, Warwick, second. For eighteen varieties Mr. Bush led; for twelve, Mr. Jones; and for six, one variety, the cards went to Mr. R. Hope, gardener to Captain Orr-Ewing, of Bletchington Park; Mr. S. Brown, gardener to W. C. Cartwright, Esq., Aynho Park; and Mr. Daniells, for Madame Carnot; while for half-a-dozen of one variety other than white Mr. Hope stood first with Phœbus, Mr. Brown second for Australian Gold, and Mr. Daniells third for Duke of York. The incurved winners were the same as at Oxford the day before, although the order of the cards was reversed; anyhow, the stands were very evenly matched, the first prize for eighteen varieties going to Mr. W. J. Johnson, North Bar, Banbury whose selection comprised Ma Perfection, C. H. Curtis, W. Tunnington, Major Bonaffon, Mrs. R. C. Kingston, J. Agate, Miss V. Foster, Mrs. N. Molyneux, Lucy Kendall, Princess of Wales, Mrs. S. Coleman, Robert Petfield, and Madame Ferlat. Reflexed and large anemones were well represented. Mr. G. Price, gardener to F. P. Bulley, Esq., Marston Hill, Fairford, was first for reflexed, Mr. Johnson leading with anemones. Mr. Price was wonderfully strong with pompon and pompon anemones in triplets (shown with nine inches of stalk and foliage), the flowers forming lovely spherical heads of rich colouring.

The show of fruit was large and of grand quality. A large number of the dishes had been to the Oxford Show. For eight dishes of apples the card went to Mr. C. Green, gardener to Miss Thomson, Stanton House, Oxford, while for four dishes Mr. R. Hope led, the finest exhibit of Blenheim Pippin coming from Mr. C. C. Butcher, Tysoe. Mr. Brown had the finest six dishes of pears, the heaviest single dish being staged by Mr. Hope. The Alicante grapes awarded the first prize were exhibited by Mr. Brown, and were regarded as superior to any exhibit in that class in the county this season; he also secured the card for some well-finished Muscats. Mr. T. Cummings, gardener to J. P Gillett, Esq., was second for black.

Vegetables in collections were most meritorious, the potatos specially good, but we have seen onions better. For potatos the best six dishes came from Mr. D. H. Wells, Tysoe, who also led for dishes of white kidney, white round, coloured round, and a collection of vegetables; the card for onions going to Mr. H. Wingrove, gardener to Captain Cottrell-Dormer, Rousham Park. Messrs. P. J. Perry, Oxford Road Nurseries, staged a number of plants, &c., not for competition, also lent neat plants to decorate the tables, and made a fine display with buttonholes, bouquets, wreaths in various designs, &c. Messrs. Deverill, Cornhill Seed Stores, and Townsend, Bloxham Nursery, sent plants; and Mr. H. Boxold exhibited three sticks of his selected pink celery weighing 15 lbs.

NORFOLK AND NORWICH HORTICULTURAL SOCIETY,
November 17.

THE society is always fortunate in securing a very fine exhibition, and in addition to filling St. Andrew's and the smaller Blackfriars hall a large canvas annexe was placed on the side of the large hall in what is known as St. Andrew's Plain. The number of entries was more than maintained, and of all departments it may be said that they maintained the high quality seen at Norwich.

Plants of chrysanthemums were represented by good bush specimens, and they bore good blooms for the number they carried. Mr. J. G. Snelling had the best six Japanese; Mr. A. J. Bunting was second, but in the following class for six incurved their positions were reversed, Mr. Bunting taking the first prize. Mr. Randell was the only exhibitor of pompons also, taking the first prize. Cut flowers were a leading feature, the Japanese in some instances being exceptionally fine, and the incurved generally very good. The best forty-eight came from Mr. F. Hanson, gardener to Sir Saville Crossley, Bart., they were even and generally well-finished, chief among them being Phœbus, Modesto, G. J. Warren, General Roberts, Mrs. G. W. Palmer, John Pockett, Madame Carnot, and Madame G. Henry. Mr. R. C. Notcutt, nurseryman, Ipswich, was a good second; this collection of excellent average quality contained a fine Mrs. Mease, which was selected as the best bloom in the show. Mr. W. R. Seago was third. The best thirty-six blooms, eighteen incurved and eighteen Japanese, came from Mr. Sheddick, gardener to A. E Fellowes, Esq., his incurved blooms being especially good. Mr. E. S. Trafford was second. His Japanese were probably rather the best, but his incurved varieties lacked the finish of Mr. Sheddick's. Mr. W. Allan, gardener to Lord Suffield, Gunton Park, Norwich, won the first prize with twenty-four excellent Japanese; they may be described as a grand lot, so good, indeed, that in addition to the first prize the certificate of the National Chrysanthemum Society was awarded for conspicuous merit. Mr. W. H. Apthorpe, Cambridge, was second. Phœbus, Modesto, Mutual Friend, and Madame Carnot were especially good. There was a good competition in the class for twelve Japanese, and Mr. C. E. Gooch was first with a dozen blooms of fine development; Mr. E. F. Buxton was second with blooms only just inferior in the aggregate. G. J. Warren and E. Molyneux—the best example of this variety we have seen this season—were particularly good.

With twelve Japanese, three of each variety, Mr. W. Allan came in first; Lord de Ramsay was second. There seemed to be some confusion in the reading of this class, as one exhibitor brought twelve blooms only in four varieties, and he could fairly put this interpretation upon the wording. The best six Japanese of any one variety were those of Mrs. G. W. Palmer, from Mr. J. A. Kendrew, with Australie. Mr. E. B. Fletcher had the best six of any white Japanese, staging very fine Madame Carnot; Mr. F. Randell was second with the same with six blooms other than white. Mr. Gooch came in first with capital Edith Tabor, really in excellent character; Mr. W. Allan coming second with very fine Mons. Chenon de Leche; Mr. F. Randell being third with Eva Knowles. Mr. Hanson took the first prize with twenty-four blooms, and such varieties as J. Agate, Lady Isabel, C. H. Curtis, Madame Ferlat, Bonnie Dundee, &c., all of a very good quality; Mr. E. S. Trafford was second with Ma Perfection, C. H. Curtis, and others in fine character. Mr. E. F. Buston was first with twelve, and Mr. B. E. Fletcher second, both having good flowers. Mr. Trafford's twelve incurved were awarded the certificate of the National Chrysanthemum Society as the best stand of blooms of that type in the show.

Fruit was scarcely up to the average of the Norwich Show either in quantity or quality, probably owing to the incidence of the season. Mr. B. E. Fletcher had the best collection of six varieties; Colonel Rous was second. Mr. C. H. Watts had the best three bunches of Black Hamburgh grapes, they might be described as extra good; and Mr. J. A. Kendrew was second. Mr. Allan had the best three bunches of any other variety, staging well-finished Alicante; Mr. Petre was second with the same.

Vegetables were largely represented, and they were generally of good quality, and so attractive did they appear to the Norwich people that it was difficult to get near them. Messrs. Sutton and Sons', Messrs. J. Carter and Co.'s, Messrs. Daniels Bros.' and other special prizes brought numerous exhibitors. Baskets of salading were full of interesting subjects. A collection of vegetables from Mr. G. Davidson, gardener to Mr. Petre, deserved special mention. Seakale was to be found in every collection.

AYLESBURY, November 17.

THIS society held its twentieth show in the Corn Exchange and the spacious Butchers' Market adjoining; the entries were four hundred and twenty-three, as against four hundred and fifty in the previous year.

In the open class but three groups were staged; that arranged by Mr. W. Tipler, gardener to Miss Smith-Dorrien, again secured the three guinea cash prize and massive silver bowl for a display of grand heads of bloom: all the leading forms were represented. Specimen plants are always good here; for nine the honours went to Mr. W. Turnham, gardener to Mrs. Bartlett, Peverel Court, who staged grand examples, five feet through, of Edith Tabor, Pride of Exmouth, M. M. Ricoud, Thos. Wilkins, W. H. Lincoln, M. Panckoucke, Madame C. Capitante, and John Lightfoot, each carrying from one hundred to one hundred and twenty blooms; Mr. Tipler second, and Mr. W. Robins, gardener to Colonel D. Lee, Hartwell Park, third. For one specimen Japanese Mr. C. Pursell, gardener to A. L. Gunn, Esq., secured the first prize with a massive plant of W. H. Lincoln; Mr. H. Brandon, gardener to Mrs. H. Gurney, second for a showy Charles Davis. Mr. Turnham was first for Cloth of Gold (reflexed). Classes were provided for sixes and threes, both in Japanese, large-flowered, and pompons, the latter section being generally of the flat type of flowers, such as the Cedo Nullis.

Cut blooms are an extensive feature here, although the repetition of the classes produces to a certain extent a repetition of varieties; the chief class is for forty-eight varieties equally divided between Japanese and incurved. Two stands were in competition, Mr. Turnham's being far and away the brightest and most massive blossoms, the following forms being represented: Japanese, back row—Silver King, Madame E Brossilon, Mrs. G. Gover, Reine d'Angleterre, G. J. Warren, Madame C. H. Payne, Eva Knowles, and Mdme. G. Henry; middle row—M. E. Andre, Madame Thérèse Rey, Australie, Lady Hanham, Madame Carnot, Baron Tate, and Mrs. G. W. Palmer; front row—Golden Gate, Madame D. Tallandier, Princess of Denmark, G. C. Schwabe, President Nonin, Robert Powell, Lord Boston, and General Roberts. Incurved, back row—Mrs. N. Molyneux, C. H. Curtis, Madame Lucy Faure, Madame Darrier, Mrs. R. C. Kingston, Miss D. Foster, Mrs. W. C. Egan, and Ernest Cannell; middle row—Globe d'Or, J. Agate, Harold Wells, William Tunnington, Jeanne d'Arc, John Fulford, Lady Isabel, and Lord Wolseley; front row—Empress of India, Bonnie Dundee, Baron Hirsch, Miss M. A. Haggas, Princess of Wales, Camille Flammarion, and Major Bonaffon; Mr. W. Tipler second, with not quite so many newer introductions as the premier set. Sixes of one variety are generally attractive, the prizes for incurved going first to Mr. Turnham, second to Mr. Tipler, and third to Mr. Buckle, gardener to C. Pigott, Esq., each for the popular yellow variety C. H. Curtis; while in the corresponding class for Japanese Mr. Tipler led with Australie, Mr. Buckle second with Charles Davis, the third place being occupied by Mr. Turnham with Madame D. Tallandier. The remaining classes were for thirty six, twenty-four, twelve, and six blooms, besides similar classes for amateur growers. Cottagers, too, were provided with classes for plants and blooms which they well filled with produce of high quality.

The fruit show was represented by about seventy dishes of apples and pears; there were nearly two hundred dozens of potatos, carrots, onions, sprouts, &c., quite dispelling the idea that we had passed through an exceptional summer, the produce of the Vale of Aylesbury being generally noted for its excellence; one exhibit of "Up to-Date" potatos from Mr. R. Hopkins was remarkably fine.

ABINGDON, November 17.

AFTER a lapse of two or three seasons the Horticultural Society revived their winter exhibition on the above date, and were successful in getting together a most creditable array of plants, blooms, and fruit, which entirely filled the staging space available in the Corn Exchange, the competition being greatly aided by a collection of plants arranged by Mr. T. Milner, gardener to Major-General Bailee; a collection of cacti from Mr. J. Stevens, Bridge House; and collections of apples sent by Mr. Joseph Brewer, Drayton, and Mr. M. W. Baker, Steventon. A very tastefully arranged group of chrysanthemums and foliage plants secured the card to Mr T. Horsley, gardener to E. J. Trendell, Esq, The Abbey, many of the blooms being very fine. Among the cut flowers Mr. A. J. Morris, gardener to F. C. Swindell, Esq., Kingston House, was a prominent winner, securing in the open class the first cards for a dozen each of incurved and Japanese, and in the local class firsts for a dozen each incurved and Japanese, six one variety in both sections, and premier incurved, the last-named being a very fine specimen of Mrs. R. C. Kingston. Miss Simpson, Ock Street, presented the best bouquet, and Miss Ballard, Park Row, the most tastefully arranged table decoration. Mr. J. Brewer led in the open competition for a dozen dishes of apples, the best dish of Blenheim Pippins, and the heaviest dish of Blenheim Pippins.

ABERDEEN CHRYSANTHEMUM SOCIETY.

THE third annual show promoted by this society was held in the Music Hall Buildings, Aberdeen. Year by year the entries have increased, and on this occasion they numbered no fewer than four hundred and sixty. These included chrysanthemums, orchids, and other pot plants, besides fruit and vegetables. In 1896, the first show of the society, the total numbers were two hundred and fifty-one, in 1897 it rose to three hundred and ninety-seven, while this year it has mounted up to the splendid total of four hundred and sixty. In point of quality, too, the show was an excellent one, the display surpassing anything previously seen in Aberdeen, and evidencing very great skill on the part of the cultivators. Lord Provost Fleming opened the show, and in doing so said the man who first found the chrysanthemum on the hillsides in Japan and brought it to these shores was almost a benefactor to our country. What had been done for the flower in developing it in colour, shape, and size was beyond calculation. It was once his fortune to be in Virginia, and to spend several days wandering through the Alleghany Mountains. There he saw the rhododendron in its native wilds. The hillsides were covered with them, just the same as ours with heather or juniper, but there the rhododendron was all of one colour—a dirty red. A Philadelphian told him that at the first flower show held at Philadelphia the Americans were amazed that British gardeners had brought back from England so many hundreds of varieties of rhododendrons; that a common plant met with every day in their own country should be so cultivated and developed by the British gardener as to become a thing of beauty. So with the chrysanthemum. On its native hillsides he understood it was only of a very few shades of colour; but now, thanks to the cultivation of the British gardener, they found the chrysanthemum such a mass of beauty as no Japanese could possibly fancy. Here in Aberdeen, where there were gardeners who had made roses famous all over the country, they would be making chrysanthemums famous also.

In the open section for pot plants Mr. George Stephen, Cuparstone Lodge, took the first prize for the best group with a splendid array of blooms, tastefully arranged. His chief varieties were Beauty of Teignmouth, Viviand Morel, and Phœbus. Mr. William Proctor, gardener to Sir William Henderson, Devanha House, took second honours with a scarcely inferior display; and Mr. Robert Mason, Claremont Street, was third. For three chrysanthemums in pots Mr. Proctor, with three splendid specimens of Souvenir d'un Ami, Commandant Blussett, and Charles Davis, was first. Mr. John Robertson, Ferryhill House, was second with very good plants, but somewhat overgrown. Coming to the cut flowers, the feature of the section, and, indeed, of the show, was the entry of Mr. J. Grant, Crimonmogate, in the class of twenty-four Japanese chrysanthemums, of at least twelve different varieties. A better exhibit has never been seen in the North of Scotland. The finest varieties in Mr. Grant's collection were Simplicity, Australie, Edith Tabor, Mrs. C. H. Payne, Mutual Friend, Phœbus, Oceana, Pride of Madford, Edwin Molyneux, Australian Gold, and Modesto, the last named being a magnificent orange. Mr. William Ogg, Morkeu, was second in this contest with some lovely blooms, but lacking the grace and texture of the first-prize collection. Other principal prize-winners in the sections for all-comers were Mr. John Pirie, Strichen; Mr. Fraser, Crathes Castle; Mr. Alexander Robb, Glenburnie Park; Mr. Reid, Durris; Mr. Grigor, Fairfield; and Mr. Kennedy, Brucklay.

The following are the principal special prizes and the winners: Open—Three chrysanthemums, pots not to exceed eleven inches in diameter, first prize, a gold medal, Mr. William Proctor, Devanha House; six chrysanthemums, at least four varieties, pots not to exceed six inches, one bloom to each plant, Mr. W. Ogg, Morkeu; a dozen Japanese chrysanthemums, at least six varieties, all named, Mr. J. Pirie, Strichen; twelve incurved chrysanthemums, at least six varieties, all named, first prize a gold medal, Mr. Grant, Crimonmogate; six bunches single chrysanthemums, at least four varieties, first prize a silver medal, Mr. Grigor, Fairfield; one hand bouquet, chrysanthemums, any kind of foliage, gold medal, Mr. Robb, Glenburnie Park; lady's spray, chrysanthemums, any kind of foliage, silver medal, J. H. Fyfe, Thistle Place, Aberdeen.

In the amateur classes gold medals were won by Mr. Coutts, Hardgate, Aberdeen, and Mr. Tough, Bon Accord Street. Mr. Coutts also carried off a silver medal for the best six blooms.

There were one or two additions to the show in the shape of non-competitive displays. Messrs. Dobbie and Co., Rothesay, had a very fine display of chrysanthemums, including four dozen varieties, mostly new. Prominent amongst these was a beautiful green French variety, Madame E. Roger, and the collection was backed by two dozen bunches of decorative kinds. Messrs. William Smith and Sons, Burnside Nurseries, Aberdeen, had also a very pretty and attractive collection, which was much admired.

WOKINGHAM CHRYSANTHEMUM SOCIETY.

NOVEMBER 22 appears late for a show so far south, and yet the Drill Hall of this town was full of plants and flowers, with some fruits and vegetables thrown in, and all was bright and effective. Groups and specimen plants were round the sides and the tables of cut flowers and fruit along the centre of the hall. The best circular group came from Mr. J. Cowie, gardener to Sir T. Lucas, Bart., and it was tastefully arranged, though chrysanthemums were somewhat sparingly used, Mr. W. P. Bound, gardener to Mrs. Leveson-Gower, with more chrysanthemums, but not nearly so tastefully arranged. The first-prize group of chrysanthemum plants not disbudded was a very attractive one; it came from Mr. C Moles, gardener to W. H. Palmer, Esq., the president of the society. Mr. R. Chamberlain, gardener to F. N. Lonergan, Esq., was second. There was a class for a smaller group; also for a specimen stove and greenhouse plant, the best being a well-coloured piece of Dracæna Lindeni.

The best twelve blooms of incurved chrysanthemums came from Mr. G. Lane, gardener to Miss Ridges, Englefield, who had good-sized, well-finished, solid blooms of Mdlle. L. Faure, Dorothy Foster, Ma Perfection, Egyptian—much more refined than is generally seen—C. H. Curtis, Violet Foster, Bonnie Dundee, Empress of India, &c. Mr. R. Bassil, gardener to D. H. Evans, Esq., Pangbourne, was a good second, his leading blooms being C. H. Curtis, Madame Darrier, Mrs. J. Gardener, and J. Agate. With six incurved of one variety Mr. Lane was the only exhibitor, taking the first prize.

Mr. R. Bassil had a decided first with twelve Japanese, having in capital character Charles Davis, Lady Hanham, Edith Tabor, Australie, Ella Curtis, Mrs. Maline Grant, International, Baroness Rothschild, Miss Nellie Pockett, &c. Mr. G. Lane came second with fine blooms of Madame Carnot, Jaline, as a very striking incurved Japanese, Mdlle. L. Zede, Graphic, Joseph Brooks, Madame Ricoud, &c. Mr. Bassil was first with six blooms of one variety, staging Australie; Mr. Lane was second with Desdemona.

One feature was a small group of cut chrysanthemums with several foliage plants, ranged on a raised table, and it brought several exhibits, the best coming from Mr. E. Paine, gardener to the Rev. A. G. Campbell, Bracknell. Mr. R. Chamberlain was second. There was too much formality about most of them. Some fruit was staged; the best two bunches of white Muscats came from Mr. H. Howell, gardener to G E. Kingers, Esq., Mr. R. Chamberlain being first in the black class with well-finished Alicante. Mr. Chamberlain was first with four dishes of excellent dessert apples, the varieties Blenheim Pippin, Cox's Orange Pippin, King Pippin, and Fearn's Pippin. Mr. W. P. Bound was second with Blenheim Pippin, King of Tompkin's County, Ribston Pippin, and under the name of Jellyflower a pretty apple of excellent flavour, of the style of Worcester Pearmain, but so much later. Mr. Bound was first with four dishes of culinary apples, having in fine character Stone's, Alfriston, Mère de Ménage, and Peasgood's Nonsuch. Mr. G. Langridge was second, with some good fruit also. Mr. Chamberlain had the best four dishes of pears, the varieties Pitmaston Duchess, Beurré Clairgeau, Doyenne du Comice, and Beurré Sterkman's.

There was a division for amateurs in which were classes for groups, specimen plants, dishes of apples, collections of vegetables, all of which were interesting to visitors. Messrs. Sutton and Sons offered prizes for a collection of six varieties of vegetables, and there were prizes for honey in addition. Mr. Bound had a quantity of All-the-year-round Tomato, of which he speaks very highly, both as a cropper and as a market sort. Mr. C. F. Pontin, florist, Wokingham, gaily decorated the front of the orchestra with plants and flowers, and Messrs. Gale and Son, seedsmen, Wokingham, had a collection of potatos and horticultural requisites.

THAME CHRYSANTHEMUM SHOW, November 15.

THE first exhibition of this society was held in the Jubilee Town Hall, and, associated with a musical entertainment, proved a financial success. There were one or two nice groups, but the specimen plants were scarcely equal to exhibition standard, the best plant in the room being a naturally-grown W. H. Lincoln.

Cut blooms were the redeeming feature. In the class for twenty-four incurved the prize went to a very even, fresh lot of flowers staged by Mr. C. Marcham, gardener to G. W. Bennett, Esq., Tiddington House, the varieties being Mrs. R. C. Kingston, C. H. Curtis, Queen of England, Globe d'Or, Empress of India, Miss M. A. Haggas, Bonnie Dundee, Princess of Wales, Baron Hirsch, Brookleigh Gem, Mrs. Heale, Jeanne d'Arc, Harold Wells, Camille Flammarion, Violet Tomlin, Mrs. Coleman, and Golden Empress. Two stands of twenty-four varieties of Japanese were in competition, Mr. Marcham again leading with massive well-finished flowers of Australie, Phœbus, Mutual Friend, Eva Knowles, Mrs. G. W. Palmer, Good Gracious, Duke of York, Australian Gold, Madame C. H. Payne, M. Panckoucke, N.C.S. Jubilee, Graphic, Charles Davis, Van den Heed, Madame Carnot, Robert Powell, Madame Thérèse Rey, Mrs. E. G. Hill, Mrs. Orchard, Oceana, M. Gruyer, Etoile de Lyon, and Rose Wynne; Mr. Tranter, Henley-on-Thames, second, with a lot of big blooms, his best back row comprising Pride of Madford, Madame Carnot, General Roberts, Viviand Morel, Mrs. H. Weeks, Charles Davis, and Australie. For a dozen blooms in two varieties the first prize went to Mr. Marcham for Madame Carnot and Phœbus; Mr. Tranter, second, for Phœbus, and Mrs. J. R. Tranter, a large spreading Japanese with long florets, blush white, with a pink shade caused by the petals occasionally bearing pink stripes.

LOUGHBOROUGH GARDENERS' ASSOCIATION.

AT the meeting of the Loughborough Gardeners' Mutual Improvement Association held on Tuesday, November 15, and presided over by Mr. W. English, of Kingston Gardens, Mr. A. Hamshire, jun., of The Gardens, Beau Manor, read his prize essay upon Cyclamen Cultivation, which was well received by the members present. The essayist referred to the seed-sowing and subsequent potting and manipulation of the plants, arriving at the flowering period in about eighteen months from the time of sowing. The discussion following chiefly dwelt on the temperature, the opinion of members being that the recommendation of the essayist was too high during the growing period.

The Co-operative Room was made gay with exhibits of chrysanthemums by Messrs. Smith and Son, Derby Road Nurseries, whose exhibits of Japanese chrysanthemums have carried all honours at the county shows, viz., Loughborough, Leicester, and Melton Mowbray. Upon this occasion they staged ten dozen Japanese in forty varieties and three dozen incurved in twenty-four varieties, the whole making a fine display. The best eighteen varieties of Japanese were Mrs. J. Lewis, Mutual Friend, Ella Curtis, Australie, Simplicity, Lady E. Clarke, Mrs. Palmer, Viviand Morel, Eva Knowles, Mons. G. Bruant, President Nonin, Lady Ridgeway, Mrs. M. Grant, N.C.S. Jubilee, Lady Hanham, and Elthorne Beauty. The best twelve incurved: Madame L. Faure, Ma Perfection, Topaze Orientale, Dorothy Foster, Violet Foster, C. H. Curtis, Austen Cannell, Ernest Cannell, Lady Isabel, Madame Darrier, Duchess of Fife, and Robert Petfield.

Mr. H. Weeks, of Thrumpton Hall Gardens, who as a raiser of new varieties of Japanese chrysanthemums has achieved so marked a success as the receiver of four F.C. certificates by the N.C.S. for some of his seedlings this year (and probably before this is in print other honours will be added to his list), afforded the members of the association a treat in the way of an exhibit of twelve seedlings not yet in commerce, some yet unnamed, the following varieties being staged: Henry Weeks, Mrs. Coombe, Mrs. Cursham, William Cursham, Mrs. Barkley, Edith Dashwood, Emily Towers, Annie Prevost, and other seedlings not yet named. The flowers in this exhibit were remarkable for the breadth of florets and substance of bloom, being after the type of Mrs. Weeks, which is so well known. Mr. F. Reynolds, gardener to W. B. Paget, Esq., was the only exhibitor in the competitive class, staging four plants of chrysanthemums, Mons. C. de Leche and one of C. H. Curtis.

SHIRLEY GARDENERS' ASSOCIATION.

THE monthly meeting of the above society was held at the Parish Room, Shirley, Southampton, on Monday, the 21st inst., the President, W. F. G. Spranger, Esq., presiding over a good attendance. The lecture was the first of two to be given on "The Soil," under the auspices of the Technical Education Committee of the Hants County Council. Mr. E. T. Mellor, B.Sc. London, Lecturer in Biology at the Hartley College, Southampton, dealt with his subject in a most interesting and at the same time instructive manner, profusely illustrating his remarks by means of lantern slides, chemical experiments, and diagrams. At the close of the lecture a number of interesting questions were put to the lecturer, and replied to in a satisfactory manner. The chief points of the lecture were: (1) The origin and formation of soils; (2) the composition of soils; (3) nutritive and other constituents of soils. The next monthly lecturer will deal with the chemical aspect of the subject. Cordial votes of thanks were accorded to Mr. Mellor, to the President, and the exhibitors at the close of the meeting. There was a very good display of chrysanthemums contributed by the members, to some of whom first-class certificates were awarded.

CHESTER PAXTON SOCIETY.

THE ninth annual exhibition of fruit and chrysanthemums was held by this society in the Town Hall, Chester, and it proved to be the largest ever held under the auspices of this body. Close upon 1,800 dishes of fruit were staged, as against 1,100 last year. The entries for chrysanthemums were also above those of any previous year. Taking the exhibition as a whole, the fruit was much above the average, the colour being especially good for this immediate neighbourhood.

In past years the majority of the prizes have been carried off by North Wales exhibitors, but this year they had to take second place to local growers, the principal prize-winners for fruit being the Rev. L. Garnett, Christleton; H. Lyle Smyth, Esq., Barrowmore Hall, gardener Mr. E. Morris; Mrs. Townsend Ince, Christleton Hall, gardener Mr. Thomas Weaver; Lord Combermere, Combermere Abbey, gardener Mr. E. Severn; and Mrs. Pochin, Bodnant Hall, gardener Mr. J. Saunderson. Mrs. Hudson, Bache Hall, gardener Mr. E. Stubbs, carried off first prize for the group of chrysanthemums, Mr. J. Wynne Ffoulkes, Old Northgate House, who had gained this prize for the two previous years, having to take second place this time. F. A. Potts, Esq., Horsley Hall, gardener Mr. W. H. Shaw, carried off in a strong competition the first prize for twelve cut blooms of distinct Japanese varieties. For the premier Japanese bloom Lord Trevor, gardener Mr. Dawes, was awarded a silver medal, and for the best incurved bloom James Tomkinson, Esq., gardener Mr. O. Roberts, was also awarded a silver medal.

A magnificent exhibit, sent by Mr. N. F. Barnes, gardener to his Grace the Duke of Westminster, Eaton Hall, and comprising apples, pears, melons, grapes, and other fruits, was much admired, and was unanimously awarded a silver medal. Messrs. Dicksons also sent a beautiful selection of choice greenhouse plants and hardy fruits from their nurseries. The committee, of which Mr. N. F. Barnes is chairman, and Mr. G. P. Milne hon. secretary, are to be congratulated upon the success which has attended the exhibition this year.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY.

THE Floral Committee awarded at a recent meeting first-class certificates to Mr. T. E. Houtvester, of Utrecht, for chrysanthemums President Nonin and Soleil d'Octobre; to Messrs. E. H. Krelage and Son, of Haarlem, for cactus dahlias Hohenzollern, Mary Service, Mrs. Dickson, and True Friend; to Mr. Egbert Kloosterhuis, of Veendam, for Populus trichocarpa, Pyrus erythrocarpa, Stephanandra Tanakae, and Ulmus argentea albo-marginata; and to Mr. C. Meynen, of Groningen, for Vriesea hybr. retroflexa × brachystachys.

Certificates of merit were awarded to Messrs. E. H. Krelage and Son, of Haarlem, for cactus dahlias Aegir, Falka, Island Queen, Maid of Honour, and Mrs. John Goddard; and to Mr. H. D. Willink van Collen, of Breukelen, for Iochroma Warscewiczi.

A silver-gilt medal was awarded to Mr. J. Th. van den Berg, Jr., of Jutfaas, for a collection of cut flowers from Begonia tuberosa erecta gigantiflora duplex.

A silver medal was awarded to Mr. Joh. Wolfswinkel, of Enschede, for a collection of cut flowers from chrysanthemum.

NATIONAL CHRYSANTHEMUM SOCIETY.

COMMITTEE MEETING.

THE Executive Committee of this society held a meeting on Monday evening last at Carr's Restaurant, Strand, the chair being taken by Mr. T. W. Sanders. The meeting was well attended; and, after the usual preliminary business had been disposed of, Mr. Harman Payne read a letter which he had recently received from Mr. Briscoe Ironside, giving some interesting details concerning the progress of chrysanthemum culture in Italy. There was also a communication from the Secretary of the French N.C.S., thanking the committee for the cordial reception accorded to their representative to the recent exhibition, and expressing a hope that a deputation of the English society might visit the conference at Lyons next year.

A report was read from the Sites Sub-committee, setting forth the proposed arrangements with the Aquarium Company for holding next year's series of exhibitions there, and the same was agreed to. Mr. R. Dean announced that the prize money awarded at the November show amounted to £330 19s. 6d., and that one gold, seven silver-gilt, ten silver, and ten bronze medals had been awarded. For miscellaneous groups the Arbitration Committee had awarded the following: Large gold medal to Messrs. Cannell and H. J. Jones; small gold to Messrs. Williams and Son and Cutbush and Son; silver-gilt to Messrs. J. Laing, Godfrey, and Owen; large silver to Messrs. Reid and Russell; small silver to Messrs. T. S. Ware. A rough statement of assets and liabilities was then submitted and considered satisfactory. It was resolved that the Floral Committee should fix the dates of its meetings for 1899, and that that committee be invited to dine together at the conclusion of the meeting, as in former years. Several offers of special prizes were considered, and the meeting closed with the election of sixteen new members.

ANNUAL DINNER.

THE annual dinner of this flourishing society was held this year in the splendidly-appointed Crown Room of the Holborn Restaurant. The chair was taken by Sir Albert K. Rollit, LL.D, D.C.L., M.P., who was supported by Messrs. T. W. Sanders, R. Ballantine, P. Waterer, R. Dean, C. H. Payne, G. Gordon, A. Outram, E. Harland, F. A. Bevan, J. W. Wilkinson, Simpson, &c., &c.; in fact, almost all who are interested specially in this society were present, and many brought their ladies to grace the function, and this new departure was greatly appreciated.

The "Donors of Special Prizes" was the toast ably proposed by Mr. P. Waterer, who suitably referred to the fine competition brought out by the Aquarium Company's prize, also to the satisfaction that all the donors of special prizes must have felt at the competition these created, and the manner in which they helped to enlarge the show. Mr. Waterer also noted Mr. Simpson's prize for the premier bloom of the show in November last, a fine painting of whieh was shown at the dinner. Mr. Waterer advocated the display of big cut blooms in vases, and thought no one would regret offering a silver cup for such a display. The speaker offered five guineas as a first prize—provided the executive accepted it—for the best essay on the Chrysanthemum Rust. Mr. J. W. Wilkinson and Mr. H. J. Jones responded to this toast, the former alluding at length to the progressive condition of the society, and to the vast interest that special prizes create, concluding by suggesting that many others should follow the lead of the many special-prize donors already on the list. Mr. Jones tendered his thanks, and was thoroughly well received; he also offered to give a first prize of £25 in such a class as Mr. Waterer suggested—for twelve sets of five blooms arranged in vases.

The special prizes were then presented by Sir Albert Rollit, Mr. Berry receiving the Challenge Trophy on behalf of the Portsmouth Society, the Chairman congratulating him on the fight this society had shown. Mr. Berry responded, stating that Portsmouth was always in a fighting mood and he hoped to come again to receive the shield a third time. Mr. Higgs and Mr. Lees received the Holmes Memorial Cups, the Chairman remarking that "Fetcham" Park was a likely sort of place for securing prizes. Mr. Lees had won cups in four previous years, and was congratulated by the chairman on his continued success. Unfortunately Mr. N. Davis was not present to receive the Turner Cup, which now becomes his property. Several other winners were not present from various reasons, and the Sydenham Cup had been forwarded to its recipient. Mr. H. J. Jones, Mr. R. Kenyon, B. S. Williams and Sons, W. Aldridge, C. E. Wilkins, Messrs. Peed and Sons, and Mr. Barrass were presented with the medals, or a painting in the latter case, by Sir Albert, who had a congratulatory word for every one, and delighted the audience by his witty remarks.

The toast of the evening, "Continued Success to the National Chrysanthemum Society," was proposed by the Chairman, who made an exceedingly able and humorous speech. His credentials to horticulture were that he had opened the first Hull Chrysanthemum Show in 1884. He felt it a public duty to be present to help forward the interests of horticulture, as he considered the cultivation of flowers and vegetables the best of enjoyments, and he had advised the members of his own constituency to visit the public parks as often as possible. The cultivation of flowers raises character and improves homes. Sir Albert mightily amused the audience when he stated that when in Ireland a short time since he asked an Irishman whether he was a Home Ruler. He replied, "Good heavens! no, sir, I am a gardener." Sir Albert advocated a deeper knowledge among gardeners of the physiology of plants, of the way plants grow, live and feed, referring also to the close affinity there was between many plants and some animals. Combine theory with practice was the advice he gave, and which the audience received with applause. No chrysanthemum, he considered, was fully worthy of all the trouble taken with it. The Chinese did little to improve it, but when it came West it was greatly improved up to its present condition, when it had become one of the most valuable of the whole series generally cultivated. Sir Albert proudly referred to the fact that the Chrysanthemum Society originated in North London. Sir Albert at length referred to the work of the society, its conferences, nomenclature, its exhibition, and its social functions, and its balance at the bank, thus justifying the title of "Golden Flower," which the chrysanthemum possesses. He characterised the society as a truly national society, and trusted it would flourish for ever root and branch. The toast was enthusiastically received and with cheers.

Mr. E. Harland, of Hull, suitably proposed "The President, Vice-Presidents, Officers, Auditors, and Committees of the Society," eulogising their efforts and work, as he knew somewhat of the amount of work such had to get through. He thought the enthusiasm of the chrysanthemum grower was most marvellous, and he advocated the affiliation of societies with the National body, as to the latter all growers looked for the lead in chrysanthemum matters. Mr. Harland also advocated more decorative competitive exhibits, and hoped the National Society would do more to develop the grouping of chrysanthemums. This toast was responded to by Mr. Harman C. Payne and Mr. Stubbs.

The Chairman proposed "The Ladies" in a most charming speech, wherein he said he was glad not to have been present when ladies were absent from the festive board, but he was delighted to have been invited on the first occasion on which they had been invited. His remarks anent variously coloured chrysanthemums for the use of love-sick swains were received with delight. Mr. Leonard Brown suitably responded.

"The Health of the Chairman" was proposed by Mr. T. W. Sanders, and all agreed with him that no better chairman had ever graced their annual gatherings. Sir Albert Rollit briefly responded, and expressed the great pleasure he felt at being present. "The General and Horticultural Press" was put forward by Mr. R. Fife, and responded to by Mr. George Gordon, V.M.H., editor of the GARDENERS' MAGAZINE.

Auld Lang Syne concluded a most successful gathering. The musica arrangements were in the hands of Mr. A. Taylor.

IS THE ONION SURFACE-ROOTING?

"S.P.'s" QUERY, "Is the onion surface rooting?" may lead some to make conclusions from results without weighing the circumstances tending to lead to the same. We can, by placing a layer of rich plant food materials at a certain depth, induce a surface-rooting plant to send down its feeders to a much lower level than it would under ordinary circumstances, and this downward course of the roots will be fostered by a scarcity of food in the surface soil. Again, a deep rooting plant can be converted into a surface rooting one by furnishing the upper layer of soil with manure and keeping the lower stratum poor. For onions I have cultivated the land nearly two feet deep, mixing large quantities of farmyard manure with the soil in the bottom, and to within nine inches of the surface, ridging the latter. This was done in autumn. In February, or as soon as the ground was in working order, the ridges were levelled down, bone meal, ashes from the refuse heap, and sulphate of ammonia were scattered over and forked in to the depth of from four to six inches. A fortnight was allowed to elapse before the seeds were sown. The plants had to depend entirely upon the food constituents contained in the soil during the whole period of their growth, and so well did they generally do that I have been able to secure bulbs sixteen and seventeen inches in circumference on several occasions. By placing such a rich layer of soil and manure from nine to twenty-four inches below the surface the roots of the onions were found in many instances to have penetrated to an even greater depth. They were forced, no doubt, by necessity to go there for food. When I have only enriched the surface soil for onions no deep roots have been found. These facts lead us to believe that the scarcity of food in the surface layer and its abundance in the lower one induced the onion roots to meet the rising plant food supply and extend their extremities in its direction. It is simply a question of necessity finding a means whereby a difficulty may be overcome.

On the other hand, by reversing the conditions mentioned, and introducing carrots and beetroot in place of onions, we can produce bulbs instead of long, tapering roots. If anyone doubts this he has only to make his surface soil rich in plant food and the lower layer poor and grow his beetroots and carrots upon it. He will then have practical proof that with manures the natural habits of a plant's roots can be so changed that they will in no way agree with the generally recognised characters. Take the original plant as a specimen, and learn its habits and the natural conditions under which it grows (not a specimen produced under artificial circumstances) and then its true habits and characters will be known. In my opinion the onion is a surface-rooting plant, but although it be so its roots can be induced to go fairly deep by a rich layer of food placed below nine inches of the surface.

J. RIDDELL.

THE DAFFODIL IN CORNWALL.

ON a March evening, after my journey of over two hundred miles to judge at the first Cornwall spring flower show, I was asked, "Is it too late to go round the garden?" It is never too late to go round a garden. The new beauty of plants by lantern-light may have struck other stalkers of the midnight slug than myself. That first vision of a Cornish spring garden is unforgettable; the fair reaches of Falmouth Harbour and the pale gleam of the lighthouse in the distance, the mild air loaded with the scent of violets—those same wonderful violets which came in first by several lengths, or rather breadths, at the show next day—Marie Louise and Neapolitan the size of half-crowns—and, everywhere luminous in the half light, the daffodils, massive in bloom, tall in stem, and broad in leaf, having the air of opulent contentment peculiar to plants that have found all their heart's desire in both soil and air. Here, then, was the promised land of daffodils; here was the Mecca to reward a nearly twenty years' pilgrimage through long tracts of less perfect flowers. To predict of the treasury of spring blossom unlocked at Truro next day that this must forthwith rank as the premier English spring show was no breach of the sound rule not to prophesy until you know. It is outside the limits of this article to descant upon the glory of the great rhododendron trusses, ruby, pink, and white, or dappled with a score of lovely tints, except to note that they seldom or never reach London shows in perfection, and are literally a revelation to the March visitor from the bleaker shires, and a sight well worth a journey across the breadth of England, whether massed on the show tables, or, still better, shining against their superb foliage in the Cornish valleys. Nor must I dwell upon the Anemone fulgens, larger and of more dazzling scarlet than any before seen by me, except to here tender my regrets, *apropos* of this flower, for a misconception of the Cornish character. When the competitors for the anemone prize, and, indeed, in other departments of that first show, insisted on putting into their bunches more than the twelve blooms prescribed by the schedule, it is recorded in the book of the hon. secretaries that the judge betrayed impatience. From his after experience of invariably receiving thirteen to the dozen in all Cornish courtesies and hospitalities he is now well aware that the occurrence was owing, not to perversity or arithmetical incompetence, but purely to the fine lavishness of the Western temperament.

But to return to the daffodils. The Truro shows of 1897 and 1898 have convinced me that the daffodils of Cornwall are, or certainly ought to be, unsurpassed. The qualification of the "ought" will be explained presently. This judgment may be arrived at by the several criteria of excellence. Earliness is a point of great value, to the market-grower especially, and it is needless to demonstrate this quality of Cornish spring produce. Size is usually ranked next, and being fully familiar with the growth of all parts of England, of Ireland, the Channel Islands, and Holland, I can confidently give the palm for size, compatible with quality, to the flowers of Cornwall. The wonderful trumpet maximus of Captain Pinwell, Mr. Charles Dawson's giant Sir Watkin, and Mr. Andrew Lawry's Grand Monarque may serve as examples. In actual measurement of flower some Dutch blooms may possibly exceed these, but the latter are coarse in texture and literally dropsical, being grown in land half sand and half manure, their roots almost in the water. Colour counts next, though in my judgment it should reckon before mere size, and here the Cornish flowers hold the field. Mr. T. A. Dorrien-Smith has written of the Scilly narcissi, "I have never seen such colour as we get in C. J. Backhouse, Barri conspicuus, and other of the crimson-rimmed varieties. . . . The great feature in all the flowers is the purity and intensity of colour; whether this is caused by the salt in the air or by a porous soil . . . I cannot say." This holds good also of the mainland of Cornwall. I cannot answer the question whether this enhancement of the colouring is due to the air or the soil, but it is certain that some kinds put on a vividness which makes them almost unrecognisable by, say, the London grower. An instance is Cynosure, a tall-growing incomparabilis, with flowers of flimsy substance, worthless in my Hampshire garden, but having the characters of earliness and freedom of bloom, and in Cornwall developing so bright an orange in the rim of its cup as to be a very valuable market sort. The magnificent collection of cut narcissi from Scilly, contributed to the Truro Show this year by Mr. Dorrien-Smith, included specimens of the shapely Princess Mary, with a depth quite unknown to me of orange red in their broad saucer eyes. The red and yellow of the bunch-flowered Soleil d'Or from Scilly and the mainland are extremely pure and rich.

Of the first impression made by the Cornish daffodils as seen growing a word has already been written, but for magnificence of these plants grown to perfection on a large scale I have seen nothing to equal Mr. Andrew Lawry's flower farm in Mount's Bay. The view of acre upon acre of the silver Poeticus ornatus and the great waxen clusters of Grand Monarque stretching, under the brilliant spring sky of Cornwall, far away towards the blue bay and the ancient mount of St. Michael upstanding in the sunlight, would need the idyllic gift of a Theocritus to describe worthily. There can be no finer narcissi in flower, leaf, or bulb than those grown in this warm, alluvial soil. On the higher grounds, too, of the county, especially on the slopes of the southern valleys, and where there is much detritus of moist sandstone and granitic rock in the staple, they flourish exceedingly; indeed, no spot has come under my notice where they do not appear at home and happy. One garden has proved a perfect sanatorium for consumptive bulbs of certain beautiful but, in my less kindly soil and harsher climate, delicate varieties. The daffodil, to use the name in its modern application to all plants of the genus Narcissus, can but do well in a land to which it is in a manner indigenous. The cream white Tazzetta, nearly, if not absolutely, identical with the Scilly White of the winter market, is an immemorial dweller on the rocky slopes of St. Michael's Mount. Not to assign it to the inevitable Phœnician, that *deus ex machinâ* to cut all Cornish antiquarian knots, who is unlikely to have traded in "Dutch bulbs," its age is respectable enough if we suppose it to have been introduced by the monks half a dozen or more centuries ago. They probably had not our æsthetic enjoyment of its great tufts of pale bloom against the lichened stone, but employed it for medicinal or "still-room" concoctions. One ingredient of the celebrated liqueur of the Grande Chartreuse is said to be the expressed juice of a yellow daffodil. But possibly it is a true native, a western outlier of the widely distributed race of Narcissus polyanthus, which extends from Portugal to China, and from Switzerland to North Africa. The point, however, is that the "Mount lilies" are glad in their Cornish environment, untended, except by Lord St. Levan's anxiety, which it is hoped all will respect, that they shall be held sacred and inviolable by the tourist.

By the side of the long approach to one of the most beautiful homes in South Cornwall, in the clear spaces between rhododendrons, hydrangeas, and what not of choicest flowering shrubs, may be seen in February great colonies of the prettiest and best, to my mind, of all quite early-flowering trumpet daffodils, broad petalled, and of the softest pale yellow. This is a local kind, collected from meadows of the same estate, where it has been "always." (No; neither the writer nor the editor will give the address or forward begging letters for a bulb or two.) It was the existence in the isles of similarly wild or long-established sorts which suggested to Mr. Augustus Smith the enterprise, since so splendidly successful, of the Scilly narcissus industry. It is owing to no lack of appreciation of this work that it is scarcely mentioned here, but only because it has been written of again and again, from both the picturesque and the statistical points of view, and my subject is rather its extension to the mainland, which, it must be confessed, has but taken a leaf out of Scilly's book—

"Most can raise the flower now,
For all have got the seed,"

from the foresight and the labours of the Scilly dynasty, to whom all gratitude is due from the Cornish flower farmers.

There is little doubt that the surface soil of Cornwall must, in the long run, yield vastly greater wealth than its mines, for the former, if treated with fair consideration and elementary knowledge of scientific farming, is inexhaustible. The increase in population of our great towns is expressed in bewildering figures; and, though these millions may still be mostly fools, yet they buy flowers and have an insatiable appetite for the first flowers of spring. Climate is not to be made artificially, nor can flowers, like fruit, be brought thousands of miles over sea to undersell home produce. Moreover, the growing demand is not for cut flowers only, but also for plants, or, in the case of daffodils, for bulbs. This is an age of gardening; dwellers in the country make more of their gardens than in any past time, and never before was his daily or week end escape to this garden so prized by the man whose business or profession holds him in town. Put briefly, all respectable people nowadays have gardens, and all respectable gardens must have their complement of daffodils. The competition for new and fine varieties is sharp, and long prices are cheerfully paid. However lugubrious the talk of badness of times and reduction of establishments, rarities do not remain unsold. "Give us the luxuries of life, and we will dispense with the necessaries." Ten or twelve years ago half a guinea each was about the top value, until, with the advent of the white trumpet, Madame de Graaff, it rose to £5 5s. Messrs. Barr's large yellow trumpet, Monarch, now fetches £15 15s., and it is known that desirable seedlings, not yet in the general market, have sold at something like £35 per bulb. The shapely, clear-skinned bulb, weighty for size, small at base, can be harvested nowhere more surely than in Cornwall, and nowhere can valuable stocks be increased to better advantage. The excellence of the flowers shown at Truro has already induced at least one London firm to make overtures for a Cornish nursery. The bulk of the more ordinary commercial sorts has hitherto been supplied by Holland, but it is yearly more evident that the Dutch soil, a sand loaded for many generations past with cow manure, is not permanently suited to the cultivation of the daffodil. The Dutch bulbs are large, but rough, and, unless difficult precautions are observed of fallowing and alternate cropping, unwholesome of complexion and beset with the deadly "basal rot."

Great and increasing multitudes of bulbs are now grown on the alluvium round the Wash, mostly in the neighbourhood of Spalding and Wisbech—good bulbs, but in my judgment inferior to the best Cornish samples. The Cornish soils will probably prove more enduring, *i.e.*, possessed of a larger reserve of daffodil-food in their phosphatic and potassic constituents, and climate is all in favour of the western county. The daffodil is rightly called a hardy plant; few of its varieties are killed by cold, but it is a mistake to credit it with enjoyment of frost and cutting winds. The winter temperature of the high mountain pastures, whence the ancestors of most of our garden daffodils came, is very low, but it must be remembered that they are protected throughout the inclement months by a thick coverlet of snow. The habitat of those found on lower ground, as N. maximus from near Biarritz, is outside the zone of severe frost. A mild moist winter, with a sunny March and April, are the most favourable English conditions, and the earlier the plant matures the earlier the bulb can be lifted and placed on the market, a very important consideration. It has suited the convenience of the retail dealers to catalogue and distribute daffodil bulbs in autumn, together with their hyacinths and tulips, and unknowing customers still plant largely in October and November. But the daffodil by nature starts quickly into growth, and much of the preparation for its spring effort is made before winter. In proof let any reader lift a few bulbs at the end of July and note the length of fresh white roots. For the finest bloom and fullest increase planting should be completed by the end of August; my own more valuable seedlings are planted, when possible, in July. The time is not distant when this will be generally understood, and the district which can lift early in June and sell in July will forestall the market. The quite brief period of quiescence is indicated by the partial withering of the leaf, not by its total disappearance, and this may happen in Cornwall as early as the end of May. For the first bloom under glass bulbs should be potted or boxed proportionately early, and for the earliest supply of good bulbs there is and will be an unlimited demand. Mr. Dorrien-Smith alone forces a million Poeticus ornatus annually! In short, then, looking to the opportunities of the daffodil trade alone, every foot of suitable soil in Cornwall must steadily rise in value.

(To be continued.)

Tomatos against Walls.—The past exceptionally dry, hot summer has been specially favourable to the development of tomatos against walls out of doors. We sow tomato seed about the middle of February, grow on the young plants in good heat, and harden off in greenhouse temperature in May, planting them out the first week in June, sometimes before, weather permitting. Some of the fruit are set at this time, and if fine weather prevails these early set fruit will ripen by the end of July or early August. But this last season we had it exceptionally cold early in June, and the plants were much injured, some of them nearly destroyed, and this caused them to be exceptionally late. The new growths set fruit by the end of July and through August, and we have had the largest sample of fine formed fruit this autumn we have ever had, but late in maturing, because of the check the plants received early. The heaviest fruit was twenty-one ounces, but there were bushels from nine to twelve ounces each; most of these have been ripened under glass, and in October they were splendid. Many people who saw them were surprised to see such fine samples from out of doors. On November 21 we sent in several stone weight of the latest fruit for preserving. We have had the best main crop varieties, such as are usually grown under glass, outside, and all of them have done well; they were grown from four to five feet high, all side shoots removed, and carried four to six bunches of fruit.—GEORGE HARRIS, *Alnwick Castle Gardens.*

THE STRAIGHT TIP FOR THE WINNER is anxiously sought for prior to any of our great races, and the joy or sorrow of the recipients is largely measured by the [illegible] as they afterwards win or lose. There is no uncertainty, however, or anguished [illegible] The result of using Holloway's Pills and Ointment. After a fair trial the gain is sure and [illegible]. The Pills, taken occasionally in prescribed doses, keep the digestion in order, excite a free flow of healthy bile, and regenerate the impoverished blood with richer materials. The Ointment is a grand remedy for the removal of rheumatic pains, wounds, sores, ulcers, cuts, or bruises.—[ADVT.]

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, &c., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning change of dates.

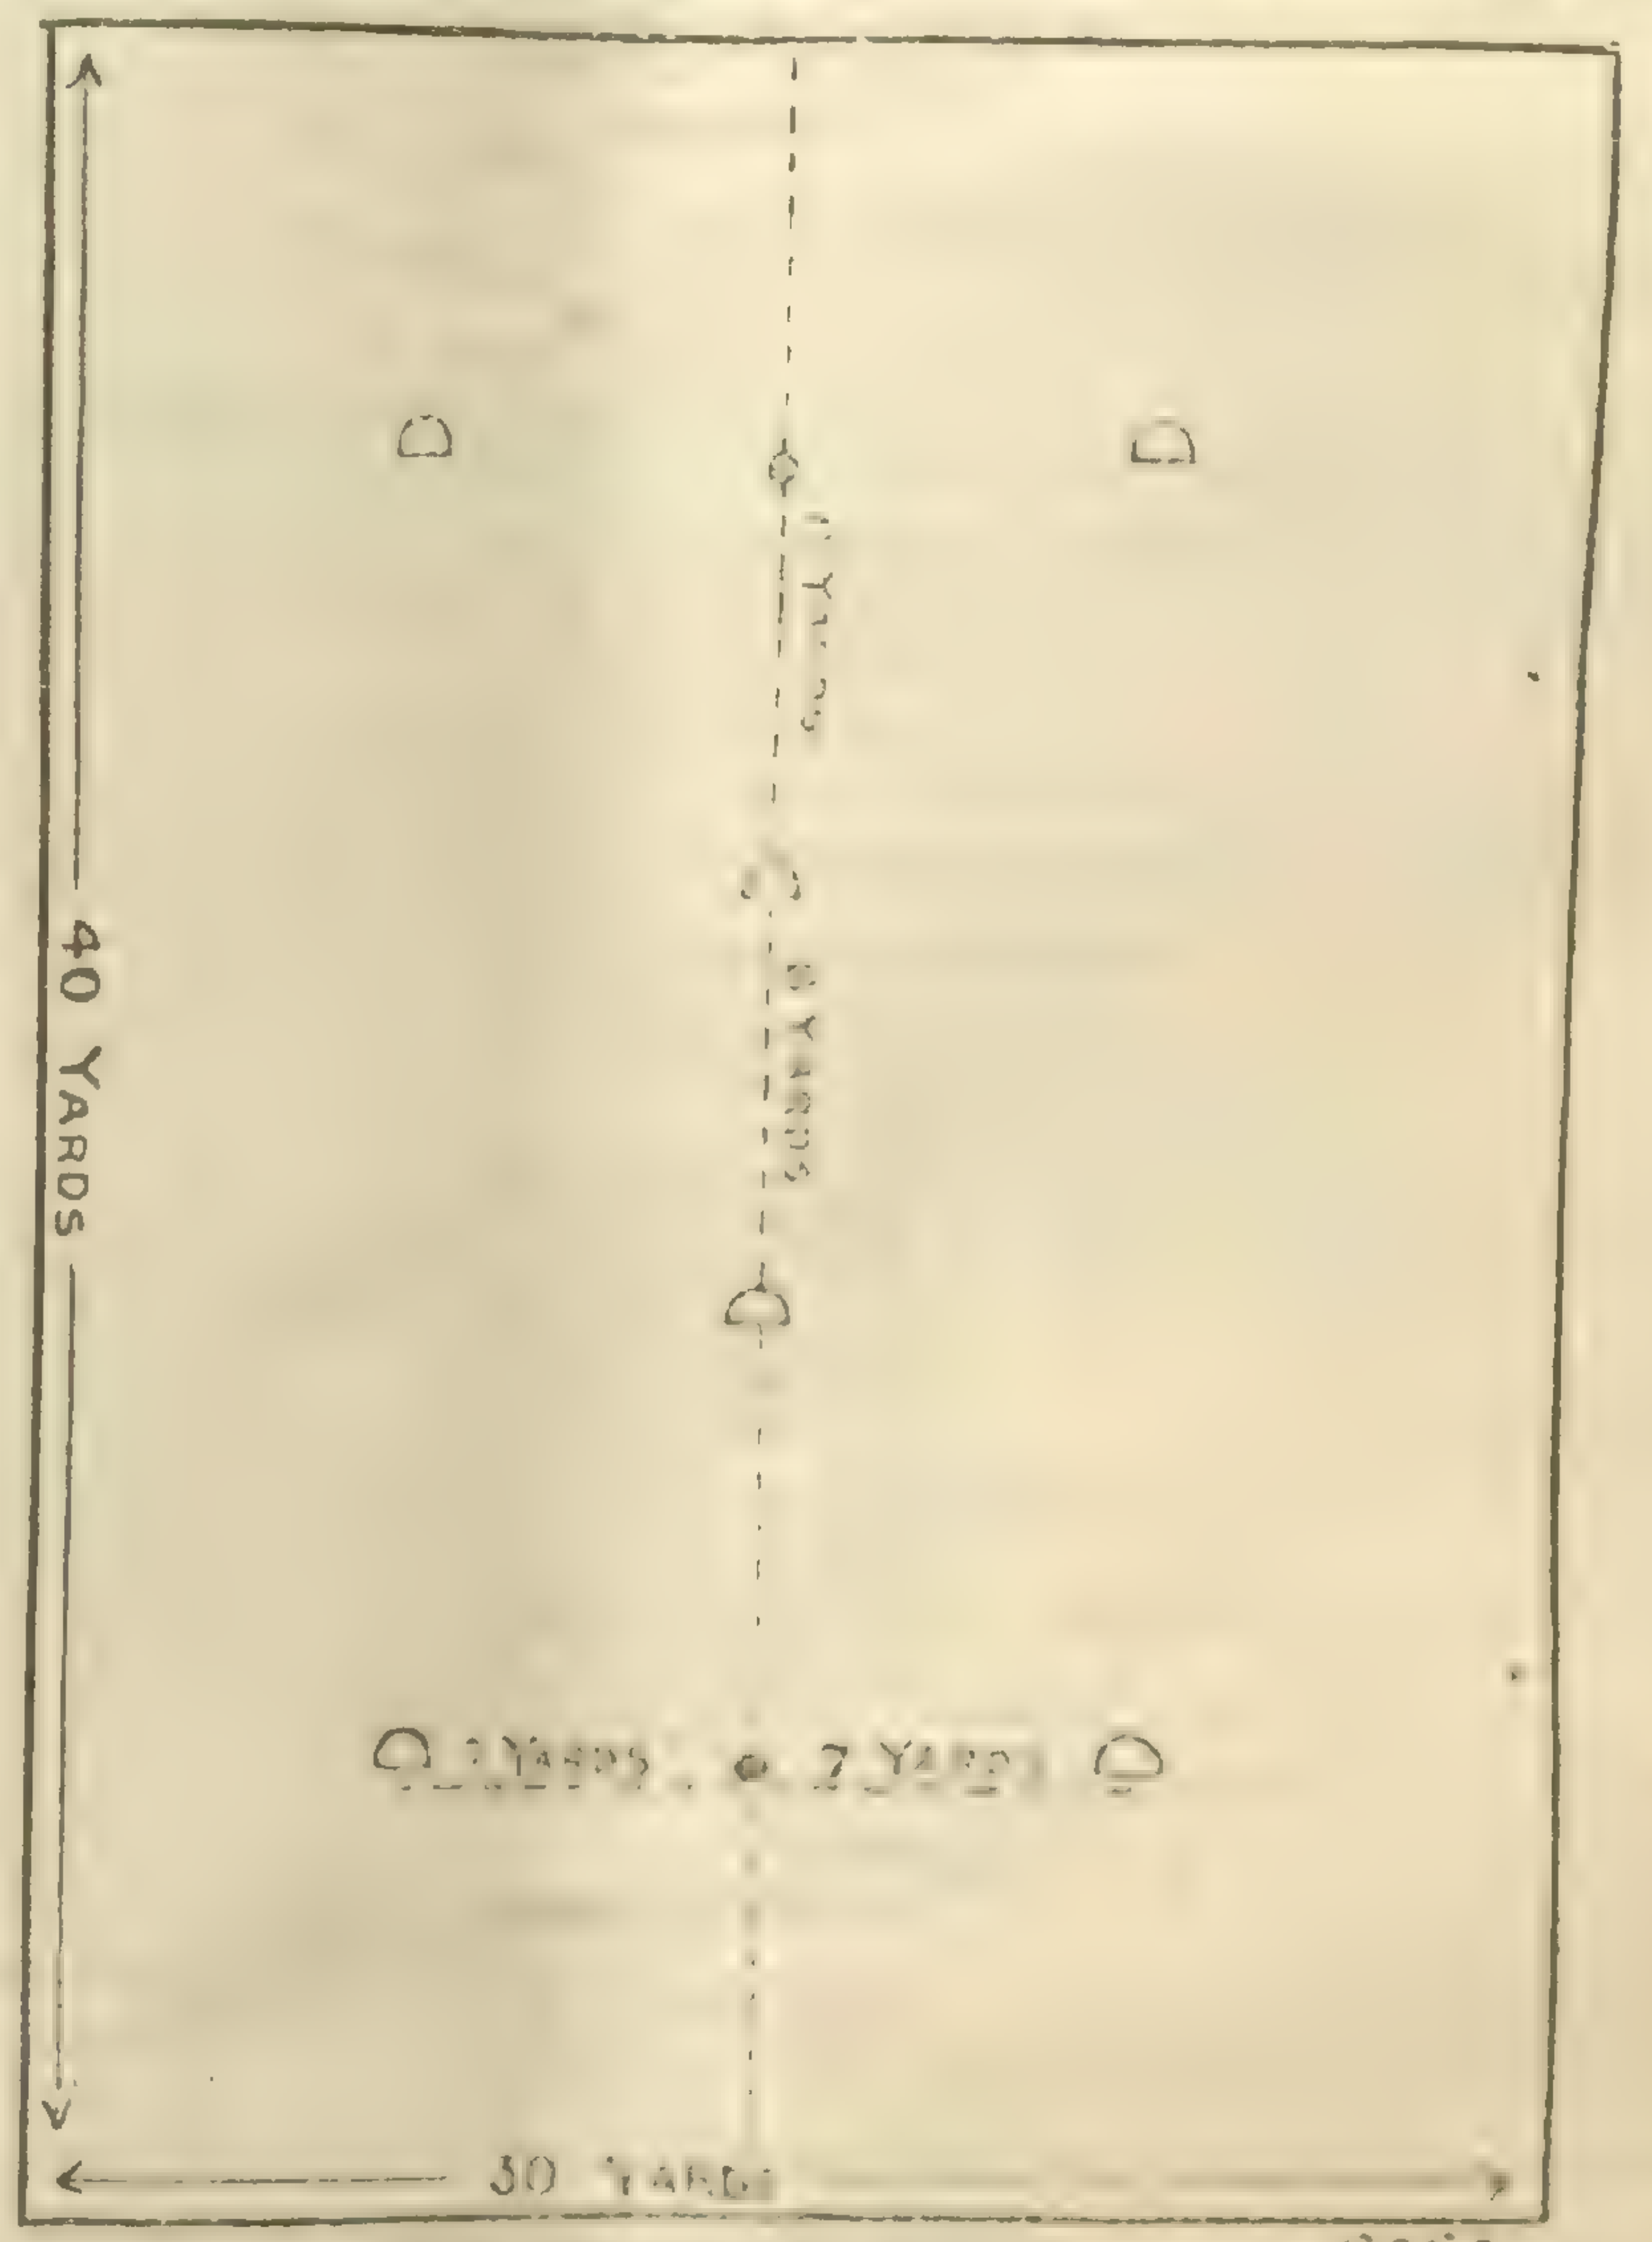
Good Dark and Yellow Roses.—A. C., Hackney: Six good dark roses are A. K. Williams, Xavier Olibo, Horace Vernet, Duke of Edinburgh, Louis Van Houtte, and Capt. Hayward. Six good yellows are Mdme. Hoste, Francisca Kruger, Caroline Kuster, Mdme. Lambard, Marie Van Houtte, and Jean Ducher.

Eligibility of Exhibitors.—A. J., Reading: The lady is quite at liberty to exhibit in other classes than those "for ladies only," provided of course there are none "for gentlemen only," as from such she would be excluded by the schedule regulations; we presume, however, she would be debarred from competing in certain classes—provided there are sections in the schedule—as she would not be eligible to exhibit both as gardener, single-handed gardener, nurseryman, and amateur, any more than a mere man would. With regard to the eligibility of a gardener who serves on a committee, such a one has every right to compete, so long as he conforms to the society's rules and regulations.

Tomatos and Cucumbers for Profit.—R. S., Nottingham: Our advice may not, perhaps, be the kind you desire or expect, but certainly we cannot advise you to start a business for yourself in the cultivation of tomatos and cucumbers for market when you have had no experience with either of these crops. You should have at least a year's experience in cultivating them ere you give up a permanent position. It would require more glass than you mention to ensure the income you wish, even provided good crops and good prices were obtained. The income could be supplemented by small cultures of various kinds that would not interfere with either tomatos or cucumbers. Obtain knowledge by experience and observation, then commence in a quiet way and build up a business according as your success, capital, and the demand shall dictate. We shall be pleased to answer any further questions.

Various Coloured Chrysanthemums.—In reply to the query from "B. W.," London, as to the cause of his flowers being deficient in colour, Mr. W. H. Lees writes:—One can only surmise that the treatment which the plants have been subjected to has in one or more details been unsatisfactory. The only cause (to which want of colour can be attributable) over which we have no control would be the impure atmosphere of large towns, as plants grown under this influence seldom develop good colours in their flowers, at least not in November. This want of colour, however, is a failure which many growers experience in good districts, and from observations I have made in several cases the weakness has been traced to one of three causes, and probably "B." will find one of these applies to his own plants. In the first place, the soil used has been of too close and adhesive a character, and by the end of the season, after the constant waterings of summer, it has become almost impervious to air, and as a consequence the roots are unable to obtain the supplies they need. It is very important to the proper development of all good qualities that the plant should be full of energy to the end, but frequently it happens, as in the case described, that the roots are unable to carry out their proper functions or are prevented extending their feeders when the final demand is made on them. A free use of old lime rubble, coarse sand, and wood ashes is the obvious remedy when the soil is mixed for potting. In the second place, a close confinement when first housed, or even later on, contributes to weak colour. The cooler the plants can reasonably be kept the better will be their colours. Any unnatural forcing by fire heat and want of ventilation cramps the energies of the plant, and as a consequence the flowers suffer in proportion. Avoid crowding the plants as much as possible, and give as much ventilation as the weather will permit. The other cause of mischief is a very common one, and is over-manuring the plants. Very frequently growers, in their anxiety to improve on previous efforts as much as possible, give extra quantities and more frequent doses of concentrated manures. Nothing so quickly defeats the object in view. An overdose of sulphate of ammonia destroys perhaps half the delicate root hairs which are busy preparing for the final effort of the plant, or a too liberal sprinkling of some compound manure on the soil kills all the roots near the surface, and so the mischief is done in mistaken kindness, and results in a proportionate failure in colour, in size, or in substance of the blooms. It is like trying to cram chickens after having half killed them and then wondering why they do not fatten. One can never overdo the caution against over-manuring, it is the stumbling-block which almost everyone falls over at some time or other, and if I were to advise that no more manures are given after the buds are taken, other than weak liquid cow manure, results in many cases would, perhaps, be much more satisfactory. At any rate, I may say do not experiment on more plants than you can afford to lose, and never employ quickly soluble manures except in the smallest quantities and in solution. One or two points in the treatment of your plants which we do not approve of are—(1) Their being left outside until the end of October; they should have been housed a month earlier, the long, damp nights which we usually experience through October are not favourable to the advancing flowers of disbudded plants at least, and those which are grown as bushes, not disbudded, are safer under cover. (2) The feeding with superphosphate, sulphate of potash, and sulphate of ammonia. If you used these in very weak solution, so that no harm to the roots took place, they could not cause failure in colour, but both the superphosphate and potash were of questionable advantage. If your soil contained a fair proportion of lime it is possible that the repeated weekly applications of these manures were too much. Taken separately, one ounce of ammonia sulphate is enough for three gallons of water, and if a variety of animal manures are used alternately, as has been advised in the GARDENERS' MAGAZINE at various times, the sulphate of ammonia need not be given more than two or three times, and this between September 25 and the end of October. (3) The blooms should be shaded from bright sun soon after they commence to expand, for, though heavy shading is not good for colour development, strong sunshine, on the other hand, is equally injurious to the flowers. Another well-known cause of deficiency of colour is too early bud selection, and though you say the want of colour was noticeable in the bush-grown plants where the buds would be late terminals it is possible your Viviand Morel and Chas. Davis were on buds taken too early, as you say these were crown buds. The best time to secure buds of the two varieties named is from August 25 to 30. Considerable care in watering after the plants are housed is very essential to the full development of colour; too much moisture is easily given. The soil should, of course, not be allowed to become dry, but must approach this condition before water is given, and each plant must have its requirements duly attended to.

Croquet Ground.—W. A., Bexhill: According to the laws of the All England Croquet Club a full-sized croquet ground should measure forty yards by thirty yards. In a line through the centre of the length of the ground two hoops and two pegs are placed; each peg is put eight yards from the end boundary of a thirty by forty ground, with the central hoops eight yards apart and eight yards from the nearest peg. The corner hoops should be in line with the pegs and seven yards from them. The accompanying diagram will assist you, but we may remark that croquet is often played on smaller grounds, and it is not necessary, except for matches played according to the A.E.C.C. rules, to allow so much space around the actual lines of play. No marking is needed, as in lawn tennis, so that once the measurements are made and the points indicated by a sunk peg it is easy to set up the six hoops and two croquet pegs.



Should Exhibitors have Extra Assistance? A correspondent writes as follows: "At our recent chrysanthemum show prizes were offered for a group of chrysanthemums arranged for effect, and the class was open only to single-handed gardeners and amateurs. There were three exhibitors, myself among them, and we all had a little assistance to bring our plants to the exhibition hall the evening before the show, such assistance being, I believe, quite allowable by all societies. The point about which I desire an opinion is whether either of the exhibitors should have been allowed to use outside aid in arranging the group, and such as would severely handicap the less fortunate ones. On entering the place of exhibition on the morning of the show I found a professional gardener and member of the society, but not an exhibitor, altering one of the groups to make it more symmetrical. I objected to his interference, on the ground that it was as much the duty of the exhibitor to arrange his plants as to have grown them; the excuse was that the real exhibitor had not the time to be present. My objection was laid before a meeting of the committee after the show, but it was decided that an exhibitor might obtain what assistance he required. The altered group was awarded first prize, and would, I think, have won in any case. I was placed second and the other competitor third, but had the latter evinced a little more taste in arrangement (or obtained outside assistance) he might have beaten me. This does not alter my contention, however, that where so much depends on tasteful arrangement it is unfair to have to compete against the combined efforts and tastes of the exhibitor and anyone he may secure to assist him."

We entirely agree with the contention of our correspondent, for if the society arranges a class in which only a single-handed gardener or an amateur may compete we hold that it is the duty of the society to make such regulations as shall ensure a fair field and no favour for the competitors. If such regulations do not exist, then the Schedule Committee is greatly to blame. It is useless to confine a class to single-handed gardeners and then allow a competitor to have the advantage of extra and professional assistance; the thing is contradictory, and such a class is a farce. In single-handed classes each exhibitor should fight for "his ain hand"; he should scorn to take advantage of an antagonist, and the committee of the society should also see that he has no opportunity of doing anything but the right.

Peas and Potatos in Pots.—O. S., Northants: It will be difficult to make a better selection of peas for pots than May Queen, Springtide, and Daisy; while for potatos a good form of Ashleaf and Snowdrop should provide all you need. As you only have a cold house at your disposal, and cannot afford any heat, it will be useless to start early, for a period of mild weather would encourage growth that a succeeding spell of cold weather would either kill or severely check. If you had an abundance of leaves so as to form a slight hotbed in the house, an early start could be made, and there would be a good chance of success in producing small early crops. As it is, we do not think anything will be gained by planting either peas or potatos before the middle of February, as then growth would not be advanced enough to suffer during the cold weather of March. One or two successional batches should be provided, if you have room, as some of the peas could be placed out of doors late in April, in a sheltered place, to finish, while the latest pot potatos could be relegated to cold frames, and covered at night if need be.

Names of Plants.—P., Warwick: Eleagnus pungens.

N. R., Halifax: 1, Cedrus atlantica; 2, Cedrus Deodara.

C. O. F., Eastbourne: 1, Libonia Penhrosiana; 2, Justicia carnea; 3, Lomaria gibba; 4, Ficus repens.

Names of Fruits.—J. F. B., Worcester: 1, Egremont Russet; 2, Beauty of Kent; 3, Baumann's Red Winter Reinette.

B. A., Bishop's Stortford: 1, Marie Louise d'Uccle; 2, Easter Beurre; 3, Doyenne du Comice; 4, Alfriston; 5, Lord Derby.

ENGAGEMENTS FOR THE ENSUING WEEK.

MEETINGS.

MARKETS.

Covent Garden.

FRUITS and vegetables are supplied in fairly large quantities, and the quality is good all round. There is a brisk demand, and a clearance is readily effected at present prices. The cut flower trade is improving, and the demand for oranges, apples, and potatos increases.

FRUIT.—English apples, 2s. 6d. to 10s. per bushel; Nova Scotian and Canadian, 10s. to 25s. per barrel; French pears, 10s. to 12s. 6d. per crate; Californian, 4s. 6d. to 7s. 6d. per case; bananas, 4s. to 8s. per bunch; pineapples, 1s. 6d. to 4s. each; Jaffa oranges, 8s. to 10s. 6d. per box; Murcia, 6s. to 7s. 6d. per case; pomegranates, 4s. 6d. to 6s. 6d. per case; English tomatos, 4s. 6d. to 6s. 6d. per 12 lb.; Bordeaux, 1s. 3d. to 2s. per box; medlars, 4s. to 5s. per box; English grapes, 9d. to 2s.; Channel Islands, 5d. to 1s. per lb.; Almeria, 10s. to 20s. per barrel.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; chrysanthemums, white and yellow, 1s. to 3s.; eucharis, 2s. to 4s.; gardenias, 1s. to 2s. 6d.; Lilium Harrisi, 5s. to 8s.; tea roses, 6d. to 1s.; pink roses, 3s. to 4s.; red roses, 1s. to 2s.; cattleyas, 5s. to 9s.; Odontoglossum crispum, 2s. to 4s.; and tuberoses, 3d. to 9d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; chrysanthemums, 6s. to 9s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 4s. to 6s. per dozen bunches; stephanotis, 1s. to 1s. 6d.; lily of the valley, 1s. to 2s.; and pelargoniums, 4d. to 6d. per dozen sprays.

VEGETABLES.—Celery, 6s. to 12s. per dozen rolls; cabbages, 4s. to 6s.; collards, 2s. to 3s.; parsnips, 2s. to 2s. 6d. per tally; endive, 1s. to 1s. 6d.; lettuce, 9d. to 1s. 3d.; cos ditto, 2s. to 2s. 6d.; cucumbers, 2s. to 4s. per dozen; eschallots, 8s. to 10s. per cwt.; English onions, 5s. to 6s. per cwt.; Albanian, 4s. to 5s.; Dutch, 3s. 6d. to 4s. per bag; Valencia, 6s. to 7s. per cwt.; turnips, 2s. to 2s. 6d.; carrots, 2s. to 2s. 6d.; parsley, 1s. 6d. to 2s.; leeks, 1s. 3d. to 2s. 6d. per dozen bunches; potatos, 60s. to 90s. per ton.

Borough Potato Market.

A steady trade exists at recent rates; supplies are fairly large and good. A spell of cold weather is needed to make prices firm. Beauty of Hebron, Snowdrop, and Up to Date, 75s. to 80s.; White Hebron, Early Puritan, Bruce Magnum, Sutton's Early Regent, Reading Giants, and Imperators, 70s.; Scottish Abundance, Bruce, and Main Crop, 70s. to 75s.; Blacklands, 60s. to 65s. per ton; Germans, 2s. 10½d. to 3s. per cwt.

THE WEATHER DURING THE WEEK ENDING NOVEMBER 26, 1898.

SANKEYS' famous GARDEN POTS
Bulwell Potteries, Nottingham.

Messrs. Dicksons, Limited, Chester, write: "The Flower Pots you have so largely supplied us with are light, strong, and well made, and in every respect highly satisfactory."

Messrs. Richard Smith and Co., Worcester, write: "We beg to say that we are highly satisfied with your Garden Pots. They are well made, light, yet strong, and we like them better than any other we have ever used."

Messrs. Fisher, Son, and Sibray, Limited, Handsworth Nurseries, Sheffield, write: "We have pleasure in testifying that after having used your pots for the past twenty-five years we have found them all that could be desired.

AN AGE OF SPECIALISTS.

20,000 Trained Trees to Select from!

50,000 Apples on Paradise!

For considerably over a century our firm has been noted for the careful cultivation of Fruit Trees, and has built up a reputation by sending out Trees **TRUE TO NAME.** During the past Sixteen Years we have greatly **extended our culture of Fruit Trees,** and, having given up the cultivation of all General Nursery Stock in favour of these, and Roses, we may fairly claim to be **Fruit Tree Specialists.** To-day we are pushing the matter still closer, and make a Speciality (without neglecting other branches of Fruit Tree Culture) of

ESPALIER TRAINED TREES.

Last Season we had a **Stock of over 20,000,** a stock which for excellence or number we believe to be without parallel. We have **Apples, Pears,** and **Plums** trained in this form. **Peaches, Nectarines, Apricots, Cherries,** &c., as fan-trained Trees. We were the first to grow **Plums** as horizontally trained Trees, a method which suits them infinitely better than any other.

DESCRIPTIVE CATALOGUE, with article on Planting, Pruning &c., 6d.; Gratis to Customers.

IMPORTANT FEATURES.

Our invention, by increasing the width of Centre Casting and continued through to the under row of Top Pipes, assures a free circulation of Hot Water from Fire Box to upper rows of pipes. This is important as it prevents concussion of the water in boiler when being sharply driven.

To prevent the possibility of leakage, each pipe is machine faced on flanges, and all turned to gauge.

Tested to a pressure of 60 lbs. in our works before despatch. Full information and prices on application,

THREE GOLD MEDALS FOR ROSES IN 1898.

WM. PAUL AND SON,

Rose Growers by Appointment to Her Majesty The Queen, Tree, Plant, Bulb, and Seed Merchants,

WALTHAM CROSS, HERTS.

Respectfully solicit orders for their unrivalled stock of

ROSES IN ALL FORMS.

STANDARDS	from **18s.** dozen.	**DWARFS or BUSHES**	from **6s.** dozen.
HALF STANDARDS	from **15s.** "	**CLIMBERS**	from **6s.** "
DWARF STANDARDS	from **10s.** "	**ROSES IN POTS**	from **10/6** "

They also beg to call attention to their extensive collections of

Fruit Trees, Hardy Trees and Shrubs, Rhododendrons, Herbaceous Plants, Climbing Plants, Camellias and Azaleas, and Bulbs, all in the best possible condition for autumn delivery.

PRICED LISTS POST FREE ON APPLICATION.

NOTE.—All Nursery Stock offered by WM. PAUL and SON is particularly fine this season, the warm, dry summer having produced exceptionally fine growths on the cool, moist, loamy soil of which their nurseries consist.

IMPORTANT!—OBSERVE CHRISTIAN NAME AND ADDRESS:

FACTS are Stubborn Things.

H. J. JONES' SUCCESSES

Sept. 6, '98.	N.C.S. Exhibition,	SMALL GOLD MEDAL.
Oct. 11.	N.C.S. Exhibition,	LARGE GOLD MEDAL.
Nov. 8.	N.C.S. Exhibition,	LARGE GOLD MEDAL.
Nov. 17.	(Edinburgh) Scottish Horticultural Association,	GOLD MEDAL.
Nov. 24.	Dundee Chrysanthemum Exhibition,	GOLD MEDAL.
Dec. 6.	N.C.S. Exhibition,	GOLD MEDAL.

The above facts

SPEAK FOR THEMSELVES,

and are better than volumes of brag and bombast, and prove the superiority of the

RYECROFT RESTED STOCK,

which, though grown so near London, is healthier than country grown stock, and up to the present time has NOT been attacked with the Rust. Thousands who have visited my Nursery and Growers of my Stock can testify to the truth of this.

WORTH POUNDS.

My CHRYSANTHEMUM CATALOGUE is not a catalogue in the ordinary sense, as it contains much valuable information, including a Special Article on Stopping and Timing nearly 600 varieties; this will be invaluable

TO EVERY EXHIBITOR,

and will be sent post free for one stamp.

A New Edition of my CHRYSANTHEMUM GUIDE is in course of preparation, which will reach one hundred thousand with this issue; it will contain, as before, articles from the pens of the most successful Cultivators of the Chrysanthemum. This will be ready early in the New Year, and will be sent post free for seven stamps, or 1s. 2d. bound in cloth.

I have much pleasure in announcing that I have arranged with Mr. W. Seward (the well-known raiser of many of our best Chrysanthemums) to introduce his magnificent varieties for '99. These are the best he has ever raised, and include what has long been wanted—some Grand Novelties in several shades of red, from terra cotta to the richest crimson. Mrs. W. Seward (a crimson scarlet), Chenon de Leche, H. J. Jones (the grandest and richest real crimson), and Mrs. Henry J. Jones (the giant incurved) are part of the set.

In addition my own Novelties include R. Hooper Pearson (the grandest yellow Jap), Lili Boutroy (large petalled white), Lord Aldenham (yellow sport from Edwin Molyneux), H. Rivers Langton (yellow sport from Mrs. W. H. Lees), Madame Leon Feyerick (yellow sport from Eva Knowles), Mr. J. T. Simpson (sport from Julia Scaramanza), Eastman Bell (crimson sport from President Borel), Mr. A. Barrett (sport from Mrs. C. H. Payne), Mr. A. H. Hall (a giant bronze seedling from Edith Tabor), Mr. A. G. Miller (a giant silvery pink), and May Manser (the new large early flowering white Jap), and several others. The full list will be ready shortly, and will be sent post free on application.

NEW CHRYSANTHEMUMS.

EXTRAORDINARY SUCCESS.

NEVER in the annals of Chrysanthemum History has such phenomenal success been achieved by any raiser of New Seedlings as by Mr. H. WEEKS, in the sensational productions exhibited by him from time to time this season before the Floral Committee.

When it is remembered that in the small collection of a private garden only a very limited number of plants can be grown of each variety, and the difficulty therefore of securing the required number of blooms stipulated for by the N.C. Society on a given day, it is indeed remarkable that no less than Eight First-class Certificates should be awarded. Other varieties equally as good had to forego their candidature from the simple fact that only two flowers could be ready at the same time, or else the total number of Certificates would have been larger. This is indeed success. I have the honour to announce that I have secured the entire stock of all these magnificent Novelties, and shall distribute same together with a few of my own, and some of the finest Australian Seedlings ever introduced.

NOTES OF THE WEEK.

NITROGEN IN SOILS.

IN their annual report of the world's wheat supply Sir J. B. Lawes and Sir J. H. Gilbert discuss at some length the questions raised by Sir William Crookes in his presidential address at the meeting of the British Association held at Bristol in September, and thereby render the report of exceptional interest to horticulturists. After dealing with the manufacture of nitrate of soda, as proposed by Sir W. Crookes, by oxidating the free nitrogen of the air by means of electricity, these eminent scientists proceed to compare the composition of some typical soils as far as their richness in certain important elements of fertility are concerned. For the purposes of this comparison they select their own soil at Rothamsted, rich prairie lands, and some rich Russian soils, and the figures that are given with regard to the stores of nitrogen within twelve inches of the surface are especially deserving of careful attention. At Rothamsted the unmanured wheat plot is described as containing 3,139 pounds of nitrogen per acre, equivalent to 20,058 pounds nitrate of soda; the average of four Manitoba soils, 10,458 pounds nitrogen, equivalent to 66,824 pounds nitrate of soda; and the average of five Russian soils, 11,207 pounds nitrogen, equivalent to 71,609 pounds nitrate of soda. Thus even in the poor Rothamsted soil the amount of combined nitrogen is large; but to the same depth the quantity is on the average three times as much in the four Manitoba soils, while the Russian soils are even more richly stored with this important plant food. These large stores exist in the soil in the form of organic nitrogen, and as such are very insoluble; but the nitrogen, it is pointed out, is gradually, though very slowly, oxidated into nitric acid, which forms with lime, soda, or other bases in the soil, very soluble salts in which state the nitrogen becomes available as plant food. As indicating the slow rate at which nitrogen is converted into a form available for vegetation, it will be of interest to mention that according to the estimate of the authors of the report the unmanured arable soil at Rothamsted yields up an average of 22½ pounds of nitrogen per acre annually, a mere fraction of the quantity locked up in the soil. The store in the Rothamsted soil, as stated above, in the first twelve inches is 3,139 pounds per acre, whilst to a depth of ninety inches it is about 15,000 pounds, and to a depth of one hundred and eight inches from 15,000 to 20,000 pounds. It is of some practical utility to know that recent experiments in the Rothamsted laboratory have brought to light the fact that a larger proportion of nitrogen is more readily soluble in rich garden soil than in arable land—a fact of importance, as confirming the views of those who consider thorough tillage as an important factor in converting plant food stored in the soil into a form in which it can be readily assimilated and utilised in the building up of the plant tissues. Sir John Lawes and Sir J. H. Gilbert are of the opinion that under more thorough cultivation the rich American, Canadian, and Russian soils would yield up much more nitrogen in an available form than they do at present, and that as the result the yield of wheat per acre would be largely increased. What is true of the wheat crop is true of other crops, and those who fully recognise the importance of deep and thorough tillage will not fail to obtain an abundant reward.

CHRYSANTHEMUMS IN VASES.

WE have so persistently advocated the staging of chrysanthemum blooms in vases, with a sufficient length of stem to admit of their being accompanied by some portion of their foliage, that we are of necessity much pleased by the rapidly accumulating proofs of the success that has attended our efforts in bringing about an admittedly much-needed change. We have from the first fully recognised the increased difficulties of presenting fully developed blooms to public notice in vases as compared with staging them in accordance with orthodox methods, but we have not had the slightest doubt of the ability of exhibitors to readily surmount them. In some quarters an exaggerated view of the labour involved in the use of vases has been taken, and in consequence of this many committees of societies have been afraid to break away from traditions and take a course that would result in the interest and attractiveness of their exhibitions being greatly enhanced. During the past two or three years it has been proved to demonstration at several of the important exhibitions that there is no justification for any apprehension as to the result of requiring some portion of the blooms to be exhibited otherwise than on the stands in general use. Nowhere has the proof been stronger than at Edinburgh, where during the past three years the competition in the vase classes has added immensely both to the interest and the attractions of the exhibitions. We specially refer to the Edinburgh shows because they have given us the most striking examples of staging chrysanthemum blooms in vases, and the strongest possible proof of the importance of a vigorous policy in reforming long-established methods of procedure. Instead of allocating the principal prizes to the blooms staged on the ordinary flat stands, they made the vase classes the most important of those provided, and at once ensured their success. We had hoped that the National Chrysanthemum Society would have been able to include a class similar to that which creates so much interest at Edinburgh in the schedule of the November exhibition, but financial considerations rendered it necessary to abandon it. There is, however, a good prospect of such a class having a place in next year's programme, for the sum of £25 has been already promised as a first prize. If the remaining prizes are proportionate, there can be no doubt that the display of blooms will be of great magnitude and immensely attractive. Much will, of course, depend upon the conditions, and fear is being expressed by some authorities, whose opinions are entitled to the highest respect, that five blooms, the number suggested, will be too many. Mr. Molyneux is afraid some difficulty will be experienced in judging the collections with five blooms in each class; but it will probably be found that the exhibitor will have a greater difficulty in cutting five blooms in exhibition form of the several varieties than that experienced by the judges in determining their relative merits. But these are matters of detail that will in due course have full consideration. We should like this form of exhibiting chrysanthemums developed on lines adapted to the requirements of the exhibitors with limited means who compete at provincial gatherings, as, for example, by instituting classes for vases in pairs, triplets, or sixes, each containing three blooms of one variety. Even single vases will assist in rendering exhibitions more diversified, and we would suggest that the whole of the contributions to the classes for six blooms of one variety should be shown in vases, the prizes being increased to compensate exhibitors for the additional trouble. We should also welcome vases of sprays that have not been disbudded, for they afford a pleasing contrast to the massive blooms, and prove highly attractive to visitors, as so strikingly exemplified at York of late years.

POINT-VALUE AWARDS.

THE issue of a second edition of the Royal Horticultural Society's excellent code of judging is an event of some importance, inasmuch as it indicates a full appreciation by judges and exhibitors of the endeavour of the Council to reduce the methods of making awards at horticultural exhibitions to a well-defined system. The publication of the code has already had the effect of improving matters at a considerable number of exhibitions, and there can be no doubt that as the value of an exact system becomes generally recognised many of the difficulties that arise at the smaller shows will disappear, and the utility of the displays be greatly increased. The code, as originally published, was so carefully prepared as not to admit of any great changes being made in the second edition, but the minor points that required emendation have undergone thorough revision, and an appendix has been added, in which point-judging and point-values are exhaustively treated. As stated in the appendix, point-judging is the most exact of all the systems of making awards, and in very close competitions it is difficult to demonstrate the correctness of a decision without giving a numerical value to every point of merit discovered in the several items of a collection. Sometimes it is stipulated that certain classes shall be judged by the point system, while in others the judges are allowed full discretion as to the method they shall adopt. Except for classes of a special character the latter course is decidedly the best, as the judges can then resort to pointing or not as they may consider desirable. When the competition is very close the collections should be pointed; but it would obviously be a waste of time to determine by pointing the merits of exhibits so far removed from each other that the untrained eye can readily distinguish them. As a corollary of the point system it seems at first sight as if the prize money should be divided in proportion to the number of marks obtained by each competitor, as is done in a special class at Carshalton. But with reference to this question it is suggested in the code that "whilst the system of point-judging cannot be too strongly recommended in all close contests, the system of point-values requires consideration, and should not be adopted too hastily," and with this suggestion we fully agree. Briefly stated, point-value is the system whereby, instead of a definite sum being offered in the schedule for the first prize, a lesser sum for the second prize, and so on, a lump sum is allotted to the class, and divided into one, two, three, or more prizes, as stated in the schedule, in proportion to the number of points obtained by the respective competitors. As sometimes only one point, or even half a point, divides the collections, it appears from a superficial view of the case that there should be a considerable difference in the value of the awards. The adoption of point-value awards would remove this inequality, but it is doubtful whether the change would promote competition. We are not of the opinion that it would, for by reducing the value of the first prizes, as it inevitably does, there would be less encouragement for the most successful cultivators to take part, and of necessity it is the finest produce that is required at public exhibitions. An example of the manner in which the sum of £5 would with four prizes be distributed under the system is given. By the system now in vogue the sum would be divided as follows: £2 first, £1 10s. second, £1 third, and 10s. fourth; whilst under the point system the same amount, presuming the prizetakers have obtained 86, 78, 65, and 62 marks, would be distributed in the following sums of £1 9s. 8d., £1 6s. 8d., £1 2s. 8d., and £1 1s. 2d. Under the latter system there is less difference between the first and fourth prizes than between the first and second under the ordinary system, but as each point above a certain average is of much greater value than one below it, the exhibitors of collections relatively low in the scale obtain too large a proportion of the prize money. This is a serious objection to point value; but it is much less than the objection on the ground of the immense amount of additional labour imposed upon the judges. Were it to be adopted in making all the awards in an exhibition, the staff of judges would have to be enormously increased to admit of the prizes being awarded within a reasonable time.

The National Chrysanthemum Society of France is evidently more progressive than the English national society, and probably more than the friends of the latter would wish it to be. At a recent meeting of the Executive Committee of the French society the question was discussed of charging a fee for each new variety submitted to the Floral Committee. M. Rozain, who introduced the proposal to charge one franc for each new variety entered for a certificate, pointed out that the meetings of this committee were a rather heavy tax upon the finances of the society, and that as the certificates were of considerable commercial value to the raisers it was only reasonable that they should bear a share of the cost of the meetings. Moreover, he thought that the imposition of a small fee would have the effect of reducing the large number of varieties now submitted for the consideration of the committee. In the result it was unanimously decided that a charge of one franc should be made. It was also resolved at the same meeting that one-half of the sum realized from entry fees should be distributed amongst the members of the committee at the close of the season proportionate to the distances travelled in attending the meetings, for the purpose of recouping some portion of the expenditure in railway travelling. The resolutions passed by the French National Chrysanthemum Society may not commend themselves to the horticulturists of the United Kingdom; but possibly some of those who take an active part in the work of the various metropolitan societies and reside some distance from London will be of the opinion that something might be said in their favour.

Golders' Hill.—Those who have taken an interest in the purchase of the Golders' Hill estate and its transference to the care of the London County Council as an enlargement of Hampstead Heath will remember that the old house and flower garden remains enclosed as yet and is not open to the public. The L.C.C. was asked at its recent meeting to decide whether or not the house and garden should or should not be let to private individuals. Mr. Shaw Lefevre suggested it should be let for £600 a year, but was met with general disapproval; his contention was that if the house were used for public purposes it would cost the Council £300 or £400 a year. To accept his proposal would, therefore, mean a difference of nearly £1,000 a year; and the amount of rent receivable would be quite sufficient to pay the interest on the amount contributed by the Council towards the purchase of the whole estate. Mr. Burns objected to the Council's converting such a fine old house into a sort of modern lodging-house for prosperous journalists or South African millionaires. Who would not, if he had the money, give £600 a year for this house and grounds? There were at least half-a-dozen millionaires who would gladly pay £3,000 a year for this place. The Earl of Meath considered that as £15,000 had been contributed by private persons towards the purchase of the estate, on the distinct understanding that the whole of the thirty-six acres were to be thrown open to the public, they had no right to break faith with these benefactors. Subsequently the recommendation of the Parks and Open Spaces' Committee, that the house and garden be not let for private use, but only as a refreshment house, reading-rooms, or other public purpose, was adopted.

West Indian Botanical Stations.—We are informed that Dr. Morris, superintendent of the Botanical Department for the Lesser Antilles, will have the control of the following stations: Barbadoes, Grenada, St. Vincent, St. Lucia, Dominica, Montserrat, Antigua, and St. Kitts. The Jamaica, Demerara, and Trinidad stations will at present remain independent, and it is proposed to establish a new station at Tobago, which will be under the control of Trinidad.

Chrysanthemums in Vases: A Suggestion.—In reading your report of the speeches made after the N.C.S. dinner last week I note with pleasure (writes Mr. E. Molyneux) the liberal offer from Mr. H. J. Jones of £25 as first prize for cut blooms staged in vases. This is a stride in the right direction, for in no other way can the large cut blooms be arranged so well as with long stems, and accompanied by their own foliage. There is one point, though, I would like to draw attention to, viz., the number of blooms in a vase—five. This is too many for the purpose, because each bloom and all portions of the bloom staged could scarcely be arranged so as to be readily inspected. With five blooms in one vase one must have an exceptionally large vase. This increases the expense of either the exhibitor or the society, and it is the latter's duty to provide vases, so as to obtain uniformity, and place all exhibitors on an equality so far as possible. Apart from this, if five blooms are to be shown in one vase, the vases should be arranged on a table so that the blooms can be seen from all sides, as five blooms are certainly too many to be examined or seen properly on a side table or staging. Present-day blooms are of such huge dimensions that crowding them will be fatal to the effect desired. Then, again, the difficulties of exhibitors would be materially increased if five blooms, rather than three, of one variety were to be shown, and thus the competition would be limited; but perhaps Mr. Jones has not in his mind the idea of any fixed number. A combination of colours in one vase seldom, if ever, has the effect produced by blooms of one kind, except perhaps in the hands of a limited few who know well how to blend colours. It is not, however, I imagine, for the limited few that Mr. Jones desires to cater; and in his desire to create a representative class at the leading shows he will excuse my comment.

Grape Classes at the Shrewsbury Fete invariably attract a fine competition, so that there is a large and first-rate exhibition annually at this enterprising town. It seems, however, that the committee of the Shropshire Horticultural Society intends to beat its best by offering £100 in cash prizes in one class for six varieties of grapes, two bunches of each, at the fête to be held in the Quarry on August 23 and 24, 1899. It may be that this specification may be altered in the meantime, but it is pretty certain the committee will offer £100 in a class for grapes to be competed for on the above dates, when the society celebrates its twenty-fifth birthday. We understand that the £100 will be allotted as follows: First prize, £30; second prize, £25; third prize, £20; fourth prize, £15; fifth prize, £10.

A Big Seed List from Kew.—Even in these days of big seed lists and catalogues the "List of Seeds of Hardy Herbaceous Plants and of Trees and Shrubs" just issued by the Kew authorities as an appendix to the *Kew Bulletin* will come as a surprise to many. The seeds listed have, for the most part, ripened at Kew during 1898, and one can imagine the large amount of labour involved in the work of gathering, labelling, packeting, and cataloguing the seeds, representing some six hundred and thirty-eight genera of hardy herbaceous, annual, and perennial plants, and some one hundred and thirty-five genera of trees and shrubs, or about three thousand five hundred species. These seeds are not sold to the general public, but are available for exchange with colonial, Indian, and foreign botanic gardens, as well as with regular correspondents of Kew. No application, except from remote colonial possessions, can be entertained after the end of March next.

An Enemy of the Tea Plant.—At the meeting of the R.H.S. Scientific Committee Mr. Michael gave an interesting account of a new species of Acarus, sent by Mr. E. E. Green, Hon. Gov. Entom. of Eton, Pundaluoya, Ceylon. They were forwarded in tubes filled with sterilised air, a plan which Mr. Green had found very useful for preserving fleshy insects in their natural form and colours. He also forwarded specimens of young tea leaves attacked by the mite, which causes considerable damage and loss of crop on the tea estates in Ceylon. Mr. Green writes as follows: "Some years ago I gave a description and figures of this mite in a little pamphlet on 'Insect Pests of the Tea Plant.' For purpose of registration I gave it the provisional name of Acarus translucens, but I find that this name is already occupied by a different mite, described by Nietner in his 'Enemies of the Coffee Tree'; therefore the insect is still nameless. I should be glad to have it properly identified. It is curious in laying two different kinds of eggs, one form being quite smooth, and another form rather larger and beautifully beaded. The latter is the most usual, and I have watched the emergence of the mite from this egg. I have only recently noticed the smooth eggs. The immature insects are very sluggish, the mature ones decidedly active. They attack the young leaves only. As each bud unfolds they move up on to it, deserting the older leaves, which, however, are permanently injured. The attack of the mite imparts a brown scaly character to the leaf cuticle, which persists throughout its life. When the unopened leaf bud is attacked the punctures are concentrated upon the groove and the infolded edges. This forms a permanent scar, appearing like a strong sub-lateral nervure on the expanded leaf." Mr. Michael observed that the mite was one of the Tarsonomi, a group only lately known, but proving to be great destroyers of vegetation—e.g., box trees at Turin were all destroyed in one season. Professor Canastrini of Padua discovered that the mite bored between the epidermises of the leaf. Another species attacks the sugar canes of Barbadoes, but does not appear to be so injurious, though fresh canes swarmed with the Tarsonomi. Few species are known as yet, but they are very destructive. They are extremely minute, and have consequently escaped detection until the last few years.

Rev. W. Wilks, secretary of the Royal Horticultural Society, will open the discussion that is to follow the monthly dinner of the Horticultural Club at the Hotel Windsor on Tuesday, December 13, and his subject is to be "Size—in Flowers, Fruit, and Vegetables." This is a subject well worthy of discussion, and it is hoped that there will be a large number of members present.

The Broughton-in-Furness Chrysanthemum Society is to be congratulated upon the success of its fifth annual exhibition. Not only was a fine exhibition provided, but in the afternoon of the show day a lecture was given by Mr. J. W. Thompson upon "The Cultivation of the Japanese Chrysanthemum for Exhibition." An exhibition and a lecture would have satisfied most people, but the good folk of Broughton-in-Furness had yet another item on the programme—a dance, this being held in the evening at the Town Hall.

Lepidodendron Wunschianum.—At a recent meeting of the Cambridge Philosophical Society a description was given of the anatomy of an unusually well-preserved stem of Lepidodendron Wunschianum recently found in a railway cutting at Dalmeny in Linlithgowshire. The stem measures nearly forty c. m. in diameter, the outer bark is well preserved, but the more delicate middle cortex was destroyed before petrification; the innermost cortex and the central cylinder show remarkably perfect structure. One of the important characters noticed in the stem was the structure of the leaf-trace bundles; these consist of a small strand of xylem more or less completely surrounded by radially disposed rows of secondary elements. The presence of numerous secretory canals in the outer cortex or phelloderm was also referred to as a feature of some interest.

The Value of Deep Tillage has been proved over and over again, and perhaps no one has so persistently advocated its adoption by agriculturists as the venerable General Sir Arthur Cotton, who is now almost in his ninety-eighth year. With three-foot tillage Sir Arthur obtained a crop of wheat this year that is more than double the average yield per acre for England, and this in spite of a severe visitation of blight. Last winter Sir A. Cotton took the temperature of the soil at the bottom of his three-foot tillage, and here the thermometer registered 47 degrees Fahr., while the surface of the soil was frozen.

The Currants that form, with raisins, the chief attraction of the grocers' shops at this season of the year, come, as most are aware, from Greece, and, curiously enough, are not currants at all, but grapes. A peculiar point about these currants is that they do not vary materially in price. This is the result of an action taken some years ago by the Greek Government to prevent the depression of prices that necessarily followed too large a supply. By an Act of 1895 the growers are compelled to deposit with the Government currants equal to 15 per cent. of the amount exported. This keeps down the supply and keeps up prices. The currants stored by the Government are sold for wine-making and distilling.

The Yang-tsze Basin, about which much has been heard of late, is undoubtedly one of the most fertile regions of China. According to Mr. Archibald Little, an authority upon the subject, in a recent lecture before the Society of Arts, the Yang-tsze basin comprises a watershed of from 600,000 to 700,000 square miles, an area twelve times as large as the area of England and Scotland. It is one of the richest, if not the richest sub-tropical region on the world's surface, and inhabited by a people as hard-working in their way as that of the United States of America, with which country it had so many points of analogy. The whole region, except the high pastoral plateau of the Tibetan portion of the catchment area, was cultivated like a garden; the mountains of Szu-chuan were terraced to their summits, and a ceaseless rotation of crops was forced rom a willing soil by the repeated applications of manure carefully garnered from the cesspools of the countless towns and villages which abounded throughout that thickly-populated country. The vast mineral resources had hitherto been practically undeveloped, but foreign methods and foreign capital would ere long do for them what Chinese hand labour had done for the surface soil, namely, develop them by mining.

Bournemouth Terrace Gardens.—For some time past the Bournemouth Town Council has been pushing forward a scheme for the alteration of the lower public gardens at an expense of £1,000. It was intended to form lakes, grottoes, and artistic bridges. The inhabitants appear to object to this expenditure, and they prepared a memorial against the scheme; this was read at a recent Council meeting, with the result that by a majority of fifteen to eight it was decided not to proceed with the scheme of alterations at present.

Comparison Between Gymnosperms and Angiosperms.—In a most interesting botanical study contributed to *Knowledge* by Mr. A. Vaughan Jennings, after comparing the cryptogams (selaginella), with phanerogams (Abies excelsa), the author compares the gymnosperm (Abies) with an angiosperm, choosing for an illustration of the latter class the Mountain or Martagon Lily (*Lilium Martagon*), collected in July at an elevation of 6,000 to 7,000 feet on the Eastern Alps. We noted, he states, that the pine belonged to the gymnosperms or naked-seeded plants, because the ovules and seeds are carried on the free surface of scales, and not enclosed in a special case. The lily, on the other hand, belongs to the angiosperms, because the ovules and seeds are contained within the walls of an enclosing "ovary." It is, however, the possession of a "flower" which one naturally regards as the distinctive feature of the angiosperms, and we have to ask at once what is a flower, and what parts of it (if any) correspond with the structures seen in the pine or selaginella. We may regard a flower as a shortened axis, bearing whorls (or spirals) of leaves, the upper of which are modified in connection with the essential organs of reproduction, and the lower specialised for purposes accessory to the process. If we imagine a pine cone shortened, its upper scales bearing ovules, those below pollen-sacs and the lowest become barren, expanded, soft, and green or coloured, we should have (details apart) the structural plan of a flower. It would be impossible to say why the lower leaves should become so altered if we knew nothing of the relationship between flowers and insects. Though almost everyone has now a general idea of the important part played by insects in securing the cross-fertilisation of plants, yet few recognise that the attraction of insects is, biologically speaking, the reason for the very existence of true flowers. The pine tree casts its myriad spores to the wind and has no need of petals to its cones, and in the same way the wind-fertilised angiosperms bear small and inconspicuous flowers without a coloured perianth. Fertilisation by this method is uncertain, and an immense amount of pollen has to be produced. With the greater certainty attainable through the agency of insects there is greater economy, but the plant must make its flowers attractive, and often form those curious devices and traps to make the insect do its work, the study of which forms so fascinating a chapter in biological study. In our mountain lily the plant's assistant seems to be usually a day-flying moth, Macroglossa stellatarum, known in Switzerland as the "Taubenschwanz" or "pigeon-tail." There are nectaries or honey-glands at the base of the perianth, and a long fold or half-closed tube leads to them along the middle of the petals. The moth, hovering below the flower, has to pass its long tongue down this tube in its efforts to get at the honey, and in doing so becomes dusted over by the shaking anthers above with the pollen, which it afterwards carries to another flower. After a careful study of pollen grains, anther sacs, and other minute details of the lily flower, Mr. Jennings finds that we can prove the presence there of parts corresponding to those observed in the higher flowerless plants. We find that even in the highest plants we can trace the relics of that "alternation of generations" which is so characteristic of the life-history of the moss and the fern. Though, from the moss upward, through the series of types studied, the Sporophyte stage has become ever more and more predominant, and the Oöphyte stage ever less and less, the microscope shows it to be still there, though hidden away among the secrets of the ovule and the pollen grain. Mr. Jennings tells no new tale, but his "studies" are pleasant reading as well as being accurate.

Atropa Belladonna and Birds.—A correspondent of *Nature* states that for eight years he has had a large plant of Atropa growing in his garden amongst currants and gooseberries; close by is a mountain-ash, and at a short distance a large cherry-tree. Birds, including the blackbird, build in the garden; but although the cherries, currants, gooseberries, and raspberries are annually stripped, the Belladonna berries are never touched. The birds are encouraged, and the frut can be spared. The Belladonna berries are conspicuous objects from July to November; there are hundreds on the plant every year, long after other fruits have vanished—black, lustrous, luscious-looking—but no bird ever touches them.

The Beautiful Scenery Around Richmond, the popular Surrey riverside resort, is once again brought before public notice owing to the settlement of the dispute between the Thames Conservancy and the trustees of the Dysart Estates. The result of this settlement, as stated by Mr. Alderman Burt at a dinner given a few evenings ago by the Mayor of Richmond, is, that while the Dysart trustees claim a large part of the riverside lands, these lands would henceforth and for all time remain unenclosed, apart from existing fences. By this agreement a strip extending from River Lane, at the foot of Richmond Terrace Gardens, to beyond Teddington Lock, several miles in length, will be secured for the use of the public.

Stephanotis floribunda.—Where large quantities of cut stephanotis flowers are required the tropical treatment recommended by D. T. F., on page 772 of the GARDENERS' MAGAZINE for November 26, is no doubt the best, at least for the greater part of the year, and especially if the plant can have a house to itself. Its great enemy, mealy bug, is then easily kept at bay. Mr. Bowman, late of Hylands Park, Chelmsford, flowered stephanotis well, trained thinly on the roof of a fruiting pine stove, and I can recall, writes S. P., many other instances of successful hot treatment in bygone years. For late exhibition purposes, &c., the cool treatment, too, has its advantages, as evidenced by Mr. Lunt. We have for some years grown stephanotis for embellishing the conservatory in summer, and here its sweet fragrance is prized after Rhyncospermum jasminoides is over; for this purpose our methods differ somewhat from those mentioned by your correspondents, and embrace both hot and cool treatment, even including a spell out of doors for resting and ripening purposes. Two plants are grown on balloon trellises, one, the Elvaston variety (mentioned by D. T. F.), is somewhat the weaker in growth, but flowers the more abundantly. One specimen is introduced to the stove in February, the other in April; the young shoots of the latter are trained under the glass to strings, and about the end of April a slight shading of summer cloud is given. Before the flowers begin to open the strings are carefully cut, the young shoots trained to the trellis, and the plants removed to a late vinery. Under the shade of the vines the flowers open slowly before being taken to the conservatory, where, under canvas shading, they last a long time. After flowering, the plants are stood out of doors, in partial shade the first week, afterwards in full sunshine, and about September 20 the plants are both housed in the late vinery, where, later on, in damp and cold weather, a little fire heat is used to preserve the grapes. In sharp, frosty weather the thermometer sometimes drops to 33 degrees, but never without heat in the pipes. Here they remain until the new year, when they are sometimes put into a vinery just started previous to being placed in the stove. Both at housing and starting times a syringing with petroleum is given, using a wineglass to the gallon of water, and keeping this well stirred during the operation. Before putting into the stove the growths are thinned and the plants shaken out and repotted if necessary; generally one is potted each year. Under this treatment the plants never fail to yield a good supply of flowers, and with very similar treatment they were exhibited a few years ago at June and July shows.

Prune Cultivation in Oregon.—The State of Oregon has now to be considered as a competitor in the market by those who have hitherto had the prune trade in their own hands. There are now some 40,000 acres of prunes in Oregon, and half this area is of trees in bearing. All the plantations, thanks to the efforts of the State Board of Agriculture, are in fine condition, clear of insects and fungoid pests. Although the 1897 crop was a heavy one, that of 1898 has been equally good on plantations where thinning is systematically carried out.

LEAVES FROM A RAMBLER'S NOTE-BOOK.

IMPRESSIONS OF THE AUTUMN.

LAST night there was a sharp pinch of frost, and to-day the sun shines brightly, as though it would put matters to rights again. But it is too late. There is a constant rustle of falling leaves, a never-ceasing drop, drop at every movement of the breeze, which leaves bare branches behind and the earth receives her own again. She has a just claim to it, and in the giving and the taking lies the chief power which moves the machinery of this great natural world. It seems but a few days since the spring, when every growing plant was drawing on the great storehouse for the strength to push forth leaf, shoot, and flower, and now the machine is reversed. Animate nature gives back that which she borrowed, repaying with interest, as the dying leaves and decayed vegetation returning to the earth carry with them valuable properties to form food for the living when the next resurrection comes. It is no miserable shuffling off as though life had proved a failure, but a grand finale set in brilliant colours; the freshness of bursting spring changed to the full ripeness of a glorious autumn, a picture of life well spent and work well done, and then a passing out with a roll of drums before the curtain falls. The tints are the same as they were last year, the year before, and for hundreds of years, and yet they seem new and marvellous in their contrasts and combinations. Woodlands present a rich panorama of wonderful colouration, too delicate, too diverse, and too pleasingly blended to be the work of anything but nature. As I write the leaves of Ampelopsis Veitchi follow one another in their downward course from the wall to the ground, and are seen through the window. First a pale yellow, then a rich orange-scarlet, and again a bright crimson, and so on; now flickering down one by one, and then in little showers, till soon their beauty will be seen no more, and nothing will be left but the bare wall and leafless stems. But there is a practical as well as a sentimental side to autumn's impressions.

"It's been a funny season," remarked a gardening friend the other day as he tilted his hat over his eyes and scratched his back hair as though that would aid him in explaining himself further, "about as funny a season as ever I remember; but, when one comes to reckon up everything, I've known many worse. It's been one of those years when one has to grow everything, watch everything, and all the time be fighting something. Take that celery, for instance," pointing to an excellent row that had just received its final earthing; "now that isn't bad for the season, and I've no doubt you've seen a good deal worse. Well, there you are, it's watching, feeding, and fighting that have done it. For days that trench was ready, and the plants fit to put out, but the soil was hard-baked, lumpy, and unkind. Then one night we had a gentle rain, and before breakfast the next morning the celery was in the trenches. So much for watching. Now some people have had to grow celery without water this season, simply because they hadn't got it, but it hasn't been a success. I was better off than that, but things had to be carefully managed, or there would have been none for the celery. The sewage tank, too, was emptied as fast as it filled, and it was wearying work at the time, but the result is there. And the fighting? Yes, there has been a good deal of that. Not much maggot; no, that's where the fighting comes in." Visions rose before me of rows of celery with the foliage brown and seared, and I contrasted them with the green, healthy plants before me. "Perhaps the main secret was the watering," added my friend. "Vigorous growth keeps insects at bay; but that wasn't all. We watched for signs of maggots, which I felt sure would come in such a season, and kept a little coarse bag of soot handy. Then just a light dusting in the morning when the dew was on, and a sharp look-out for blistered leaves. No, it didn't take long, and amply repaid the trouble. But it's like this. People are apt to forget these little preventive measures till the eggs are laid and the mischief is done, then they apply the remedies, but it's no good. It's a case of locking the stable door after the horse is stolen, and it doesn't do with celery, because the maggot is not on the surface but inside."

Autumn impressions in respect of the crops of winter greens are not altogether favourable. Forecasts have already appeared to the effect that greens will be scarce and dear before the winter is over, a report that sounds ominous to those who have to buy, and cheering in the ears of those who grow for sale and are blessed with plenty. I know from observation that some growers are fortunate in this respect, but those who have the best crop of greens are like my friend of the celery—watchers, feeders, and fighters. "Get your greens out early" is the advice of an old gardener, and this season has proved the value of it. There were gentle rains in the early summer, which some took advantage of to plant cauliflower, broccoli, Brussels sprouts, and so forth, and others had to wait because the plants were too small for removal. In the weeks that intervened those planted early got a good start, and since have not looked back much. But what of those that were not ready at the favoured moment? Drought set in, parching weeks of burning sunshine, and the greens were spoiling. Compulsion gave no choice. They had to be planted, and some by the aid of water supplied struggled through. But it was only a struggle, a mere existence for weeks before they began to grow at all, and now, when one can hardly hope for more growth, they are stunted, small, and hold out little hopes of ever being profitable. Lucky, then, were the early planters. Feeding has also assisted matters, particularly on dry, porous soils, where applications of sewage and occasional light dressings of nitrate of soda could be given. It was early in the summer when large numbers of dainty cabbage butterflies hovered about the kitchen garden, and observant men prepared for the fight. No rain came to wash away the eggs, which the warm sunshine assisted to hatch, and the caterpillar harvest was prolific. They came forward in swarms, devouring all before them where their right was not challenged, and now they have entered mother earth to winter in the chrysalis state; but they have left their traces everywhere, in the shape of mutilated foliage and leafless stems, except in the garden of the fighting man. He allowed them no quarter, but assiduously picked away as fast as the caterpillars appeared, and his labours were rewarded in the breadths of greens which are healthy and leaf-whole, and in the knowledge that the soil is free from dormant pests.

It is the commendable aim of every good gardener to pick his first dish of green peas as early as possible, and then to keep up the supply without a break till the end of the season. A very worthy idea this when Dame Nature sees fit to fall in with it, but this season she has shown her perversity in various ways, and refused to lend her aid towards a continual pea supply. The start was capital; early peas grew apace, well-filled pods formed, and we gloated over the flavour and good all-round qualities of our Chelsea Gems, American Wonders, Graduses, and so on, and trusted in the healthy-looking succession rows to carry on the supply. But our district shows a remarkably small rainfall record, and the peas were amongst the first to feel it. The ground had been trenched and well manured, but the drought was extraordinary and the water supply ran out. Day after day they became more sickly, and vigorous growth changed to a dwindling existence. An occasional watering, followed by mulchings, and the assistance rendered by early applications of superphosphate, saved some of the rows, but many of them fell a prey to the effects of the drought and the attacks of every ill and pest that pea life is heir to. We have missed our late dishes of delicious marrow fats, and our Ne Plus Ultras, Duke of Albany, Autocrat, and other late sorts have been wanting in most of their best qualities. Fortunately matters have not been so bad everywhere, as some districts have been more liberally dealt with in regard to rain. Still we cannot look back on a satisfactory pea season, even where the best of gardening efforts have been put forth.

A recent walk in a fruit plantation did not create a very favourable impression. The grower eyed his dwarf apple trees critically, and followed the operation by a doubtful shake of his head. "Two dry seasons in succession have been too much for this shallow soil, and the trees haven't made a deal of growth." He was right. Vigorous-growing kinds looked fairly well, but others had an unhealthy appearance. Growth was stunted, foliage had fallen early, and here and there branches with dead tips were noticeable—all signs that there was something wrong. "Had any fruit?" continued the grower. "No, not much; though I never saw a better show of bloom—too much, in fact, according to my opinion—but most of it fell; and though, of course, I may be wrong, I attribute it largely to the drought of last season. There was no rain in the autumn to ripen and feed the buds, and when they opened there was no stamina in the flowers." "Then, according to that theory, it does not promise well for next season?" I argued. "Afraid not; but we are hoping for more rain yet, and we've done our best to help them by watering this autumn. I never thought much about the moisture required by trees after the fruit is off till lately; but these dry autumns have convinced me that it is necessary." No doubt many others have learnt a similar lesson from Nature's teaching. As with fruit trees under glass, so with trees out of doors. Withhold water from the former during the ripening period, and unsatisfactory results are inevitable. When a light autumn rainfall follows a dry summer the same state of affairs exists in plantation and orchard, and growers cannot do better than give the fruit trees the benefit of superfluous sewage matter and water. The grower's reflections were not all of a disappointing character. Apples certainly had failed him, and his pears he could not call a success; but other fruits had given returns sufficient to put the margin on the right side of the balance-sheet—the result, as he put it, of not having all your eggs in one basket. Good advice certainly, that might be taken with advantage among other impressions gathered at the close of such a season of uncertainty.

H.

THE CHELSEA BOTANIC GARDEN.

THE Apothecaries' Society has decided, owing to considerations of expense, to abandon the management of the physic garden that was founded by Sir Hans Sloane in the early part of the eighteenth century, and was subsequently transferred to the company in trust. A scheme has accordingly been drawn up for vesting the control in the Trustees of the London Parochial Charities. The actual management is to devolve upon a committee of fifteen members, eight to be nominated by the Trustees, and one each by the Treasury, the Lord President of the Council, the Technical Education Board, the Royal Society, the Society of Apothecaries and the Royal College of Physicians in turn, the Pharmaceutical Society of Great Britain, and the Senate of the University of London. The scope of the garden is to be somewhat extended. The existing garden is to be fully maintained, a suite of rooms is to be provided for lectures and experimental teaching, and the Trustees are to be given authority, if they think fit, to erect and fully equip a physiological laboratory. An income of £800 a year is to be provided by the Trustees, and in addition the committee will be furnished with such a capital sum as may be necessary to enable them to enforce the scheme to its full extent. The committee are to appoint a curator for the scientific supervision of the garden, and power is given to them to choose the other members of the staff. Further, the committee are authorised by the scheme to provide instruction by means of lectures or otherwise in botany, with special reference to the requirements of elementary education; and to arrange for the maintenance of botanical collections of living plants for teaching purposes, and, so far as practicable, for the supply of botanical specimens for the purpose of external instruction. Students of institutions receiving aid from the funds of the City Parochial Foundation are to be eligible for admission without payment of fees, and it is provided that, so long as a yearly payment of not less than £150 is made to the Trustees out of the moneys provided by Parliament, students of the Royal College of Science shall also be admitted to the garden without payment, while they, the professors, and teachers of the college shall be entitled to the use of the garden, the botanical collections, and the lecture rooms for such time as may be approved by the Charity Commissioners. It will thus be seen that the scheme is of a far-reaching character, and is calculated to materially increase the present usefulness of the garden.

PEAS IN PLENTY.

IN the month of August last it was my good fortune to revisit Wem, a little Shropshire village that has become well known by name throughout the civilised world as the home of that grand old florist, Mr. Henry Eckford, who has given us such a host of beautiful sweet peas which delight us for months together with their elegance and fragrance, and who also has raised and distributed many of the finest culinary peas in cultivation. It is about ten or eleven years since Mr. Eckford settled at Wem, and during that period his business has increased greatly, and his seed grounds have proportionately extended to keep pace with it. For many years a large proportion of the seed peas needed were grown for Mr. Eckford in Essex, but the yield per acre was not comparable to that obtained at Wem, while the quality was not so good as that of the home-grown sample. Then the distance of Essex from Wem is considerable. It proved a costly business to pay for frequent visits to the seed farms to ensure the varieties being kept true and free from rogues. Now, however, all this has changed, and besides having under his immediate control all his new varieties of sweet and culinary peas, trials, crosses, sports, and what not, Mr. Eckford can convey a visitor to his seed farms in half an hour, as all three of his establishments lie within a mile or so of each other. Altogether, Mr. Eckford has about thirty acres of land, and not less than nine-tenths of this area is devoted to peas that are beautiful to look upon or good for food. The latest addition is a fourteen acre lot at the little hamlet of Clive, about two miles from Wem on the way to Shrewsbury, an open spot set in the midst of bracing and charming country.

Culinary Varieties.

It was at once pleasant and provoking to see magnificent crops of culinary peas at Wem at a time when in many a small southern garden this succulent vegetable was but a memory, and in larger ones was proving a vexation of spirit to the gardener who had none too much of labour or water. No matter what the season, one may depend upon seeing famous crops of peas at Wem, and when it is remembered that the pods are left to ripen—for seed, not green peas, is the end in view—then we are compelled to admire the wonderful constitution and productiveness of the Eckford varieties. In the matter of cultivation Mr. Eckford's methods do not differ materially from those adopted in good gardens; good dressings of manure are essential, and these are provided with an occasional year of rest, when lime in some form or another is given. The land is deeply ploughed as soon as possible after the crop has been harvested, threshed, and housed ready for being picked over. The soil is allowed to remain rough during winter and is worked down during suitable weather early in the year. Sowing is a big business here, and it is highly probable that no other seedsman sows and produces under his own immediate supervision such quantities of peas as does Mr. Eckford. The staff is not a big one but it is capable, and its members are well aware they have a good employer; they know all about sowing peas (previously red-leaded), the labels are ready, and with Mr. H. Eckford, his genial son Mr. J. Eckford, and their capable foreman Mr. Jones to see that there is no mixing or misplacement of tallies the work is done in a wonderfully short time in spite of the fact that besides the catalogued varieties of sweet and culinary peas there are several hundreds of crosses and trials to be sown each year. Last year all the peas were sown within three days, but, of course, the weather was fine and open and the workers did not worry about keeping an eight-hour day.

My note-book contains notes of some fifty varieties of culinary peas, these including only sorts that are catalogued, or are named ready for distribution, or have been on trial sufficiently long to justify large breadths being sown. I shall not give these in detail, nor even go to the extent of naming all the varieties noted for their special excellence, as this would prove a tedious matter. A very good idea of the Eckford culinary peas is to be obtained from Mr. Eckford's 1898 catalogue, for, putting aside the raiser's descriptions, it is seen that more than half of the twenty-eight varieties listed have gained awards from the Royal Horticultural Society, and most of these have been tested and proved at Chiswick. Even the latest issue of the society's journal testifies to the excellence of the Wem seedlings, for to the trial of thirty-nine varieties conducted at Chiswick this summer Mr. Eckford sent two, Bruce and Prior, and both these splendid forms gained awards of merit. A great feature of the Eckford race of peas is that the pods are produced in pairs, and each pod is packed as full as possible with large, highly flavoured, wrinkled, narrow peas. There is no waste of energy in these varieties - that is to say, the peas are not clustered in the centre of the pod, leaving vacant ends. So far as number of peas per pod is concerned, the girls who in former days were anxious to find a pod containing nine peas, so that they might lay it on the lintel of the kitchen door, and thus ensure to themselves as husband the first single man who afterwards entered, would now have no difficulty whatever in finding such pods at Wem during the summer, or even with ten, eleven, twelve, aye, and thirteen peas per pod; indeed, the greatest difficulty at the Wem seed ground would be to find pods with fewer than nine peas.

A few varieties must be mentioned, and perhaps a selection of twelve will answer every useful purpose; it shall be a baker's dozen, and arranged in the order of use: Eckford's No. 1, a grand early pea, five feet high, and bearing profusely the whole length of the haulm; Shropshire Hero, two and a-half feet, and The Don, four feet, first-rate second earlies; then follow Fame and Juno, the former four feet and the latter under two feet in height; Consummate and Critic, superb main crop forms, two and a-half and four and a-half feet high respectively; the latter is one of the very finest of peas no matter how considered; Colossus and Memorial, rising five feet each, both very prolific, and the former carrying immense pods full of a dozen or so of large, splendidly-flavoured peas; Superabundant and Superiority will follow, the ormer two and a-half feet and the latter five to six feet, and of the pair my inclinations are toward the latter, as it stands dry weather as readily as Critic; Heroine and Censor will bring up the rear, and are two and a-half and three feet high respectively. The varieties are paired, so that a smaller selection can be made if necessary. If you want later peas you must start again with the early varieties. If you desire the newest of the new, the finest of the best, and have no objection to paying a rather higher price, then you cannot do better than try Ideal or Pioneer as early varieties; Prior as second early; Bruce and Royalty for main crop supplies. Still later productions that will appear in the 1899 catalogue are Wem Wonder, a beautiful dwarf early that is wonderfully prolific; The Clive, a useful second early that fills up speedily; and Diamond Jubilee, a good late that succeeded splendidly under field culture at Clive and had no sticks to support it.

Each year the Eckford peas are becoming more and more popular, more extensively cultivated, and they are being annually improved; as fast as any variety previously sent out is superseded it is dropped out and its successor takes its place. This is the right method, for one does not want bewildering lists—but we do want the best varieties.

SWEET PEAS AT MR. H. ECKFORD'S CLIVE SEED GROUNDS.

Sweet Peas.

A great debt of gratitude is due to Mr. Eckford, for to his energy, patience, and persistence the development of the sweet pea from a comparatively insignificant flower to one of exquisite beauty, grace, and fragrance is mainly due. Then the intensely beautiful and varied shades of colour, or combinations of colours, now to be found in sweet peas suffice to please the most fastidious and exacting, for among them are some that will harmonise with the most subtle art shades in which my lady's boudoir can be decorated. The evolution of the sweet pea is one of the wonders of the age, horticulturally, at any rate, and, if ever a history of floriculture is written, the name of Henry Eckford will occupy a prominent place, for to few is it given to enjoy such a long and honourable career, and few, very few, have achieved so much as he, and single-handed.

Charming as are sweet peas as we see them in our own gardens, in our homes, and at exhibitions, it is only when seen by the acre, as at Wem and Clive, that they become thoroughly impressive. The grand clumps or bushes of a variety that Mr. Molyneux annually produces at the pretty Swanmore Park Gardens are, in their way, the finest I have seen, but these imposing displays are utterly eclipsed during July at Wem and Clive, when the sweet peas are in their greatest beauty. You climb an elevated platform and overlook the acres of sweet peas in the home nursery, all in long orderly rows, neatly staked, and with the flowers so closely set that each row seems to be a dense swarm of some exquisite butterfly, and the motion provided by the gentle summer zephyr accentuates this idea. Some of the more intensely coloured varieties gleam like breadths of silk or velvet in the sunshine, and at each motion of the breeze or turn of one's head new shades of colour appear in those forms that combine several hues. Such a sight is worth going a long way to see; indeed, several American enthusiasts—and Eckford's sweet peas are as well known to Brother Jonathan as John Bull—have crossed the Atlantic on purpose to see this beautiful sight. At the Clive grounds both culinary and sweet peas are grown without sticks, and here, just before the haulm begins to bend over by reason of the weight of flowers and early-formed pods of seed, an indescribably beautiful effect is produced. The long rows of sweet peas extend for several hundreds of yards across the wide field, and with a number of rows side by side—as shown in the accompanying view specially taken for the GARDENERS' MAGAZINE—the effect is better imagined than described.

Mr. Eckford is a broad-minded florist, and recognises that there are a variety of tastes with regard to the form of even such a generally popular flower as the sweet pea; consequently we find that, in addition to those bold forms that have big broad standards, there are others less militant, and yet others, known as hooded, that, like a coy maiden, partly hide their charms by infolding their segments, this very peculiarity forming, paradoxical as it may seem, one of their greatest charms. Some eighty varieties are kept true at Wem, and constitute the trade collection, but year by year finer forms and distinct shades are introduced, or a great improvement is effected upon the depth of colour in existing and old forms, so that the forward movement is as noticeable in this quiet village as in the larger centres of industry. A glance at the R H.S. list of awards shows that up to 1893 sixteen certificates and awards had been granted for sweet peas, and of this number thirteen were made to Mr. Eckford. Since then Mr. Eckford has fully maintained his position as a raiser, and during the past summer several beautiful forms gained the highest honour the R.H.S. could confer upon them. Just as in the case of roses, so with sweet peas, it is a very difficult matter to make a selection of even a dozen varieties that will exactly meet the tastes of all persons; fortunately, Mr. Eckford exhibits largely in summer time, and so growers have an opportunity of noting what best pleases them For my own part a suitable dozen, excluding the new varieties that will be soon offered, would be Blanche Burpee, white; Queen Victoria, very pale yellow; Shahzada, deep and rich marone; Salopian, brilliant red and orange; Prince Edward of York, a real beauty, rose and scarlet; Lady Nina Balfour, greyish mauve; Lady Grisel Hamilton, heliotrope; Prince of Wales, deep clear rose; Colonist, lilac and soft rose; Black Knight, marone, with a metallic lustre; Lady Mary Currie, a lovely shade of pink; and Lady Beaconsfield, salmon-rose and yellow. Mrs. Sankey would form a fine additional white.

Some beautiful and entirely new forms that are to be distributed shortly are as follows: Sadie Burpee, a splendid white flower, but a black-seeded variety. For size, substance, freedom, and grace it cannot be surpassed; it is a hooded flower. Sadie Burpee quite captured the R.H.S. Floral Committee, and gained an award of merit during the present year. Lady Skelmersdale was seen at several exhibitions during the summer, and is a charming hooded variety in which white and rosy-lilac are sweetly combined. Duke of Westminster is a magnificent form both in size, shape, and colour, the latter being a rosy marone tinged in a unique way with violet; this and Sadie Burpee are, to my mind, the two finest novelties of the set. Countess Cadogan has slightly hooded flowers of a bright violet-blue hue. Mrs. Dugdale bears finely-expanded blooms with rose and primrose standards, and primrose wings that are splashed with very pale rose. Hon. F. Bouverie is a variety that cannot fail to receive a cordial welcome, especially from the ladies, by reason of its exquisite coral-pink colour; in size and freedom it is also one of the best. Mr. Eckford has a fine rich crimson-purple form named Othello, but whether the stock is sufficient to justify its distribution in 1899 has not yet been decided. The new set give us new and pleasing shades of colour; they are robust, free flowering, and as beautiful as only first-rate sweet peas can be. The flowers are of wonderful substance, as many have had opportunities of noting at the Drill Hall, Crystal Palace, Hanley, Leicester, Cardiff, and elsewhere during the past summer; they also are carried on long, stout stems, and almost in every instance three flowers on a stem.

Pansies and Grasses.

In addition to the masses of peas, both drawing and dining-room varieties, Mr. Eckford and his son devote a good deal of energy to the improvement of pansies, and a wonderfully fine strain they possess, especially in bronze and yellow forms; while the breadths of Bronze Prince are something to admire and remember. Ornamental grasses are largely grown, and these are eminently useful for association with sweet pea flowers in vases. Chinese primulas are carefully seeded and selected, so that the strain is of a high order of merit. Verbenas are good, and this reminds me that there was a time when each year found floriculturists as eager to discover what new verbenas Mr. Eckford had raised as to-day they are to find the newest and biggest chrysanthemums. Dahlias are not wanting, for Mr. Eckford does not like to be entirely "off" with his old loves, though he is well on with the new.

There are few greater pleasures in the life of a busy horticultural scribe than that of a quiet day with Mr. Eckford at his seed grounds. Fresh, clear, and bracing air, peace and quiet, open country, beautiful flowers, and a companion whose wealth of knowledge, gained by experience, is only exceeded by his intense love of all that is beautiful in flowers; what more could one want? The stately old Scotsman has long since passed his allotted span of threescore years and ten, but he is hale and hearty, firm of foot, and keeps his seventy-odd inches as erect as most of us less than half his age. If further proof of the vigour of this grand old florist is needed, it may perchance be found in the fact that two years ago he learned to ride a bicycle, and now, week in and week out, he may be seen on most days merrily wheeling out or in between his comfortable home and the grounds at Clive or Wem; but even at Wem, unfortunately, grey hairs are not exempt from the camera demon, and an evil-hearted snapshottist caught Mr. H. Eckford "in the act" last summer, and gave me the result, which I shall keep as a souvenir of my brief sojourn where, even in 1898, there were Peas in Plenty.

SERVATOR.

THE BIRCH AS AN AVENUE TREE.

WE have few trees to equal the birch for freshness, fragrance, grace, and beauty, and the chief fault urged against it for such a distinguished position as the formation of an avenue is its lack of size and longevity. It seldom attains a height of more than fifty or sixty feet, or lives much longer in good health or full beauty than a hundred years. But even in ruin the birch is picturesque, full of the sheen of twinkling life, mobile grace and beauty, so that while attaining its majority or sinking into venerable age through a century of years or more, in groups or single trees, avenues, or hedgerow, who shall say how many eyes it has refreshed with its graceful branchlets, or lightened with the paper whiteness of its silvern bark? The stem as well as the head of the birch is filled to overflowing with grace. A recent correspondent's hedgerow tree, three feet in diameter at seven feet from the ground, and others with wide spreading drooping heads, twenty yards in diameter, must indeed be weeping giants worth a long journey to see.

The average size of white birch seldom exceeds five feet in circumference, nor its height sixty feet, and in fact the birch is never more graceful than at much smaller sizes than these. For the white birch is emphatically a tree to live with rather than to be overshadowed by; though looking up through the mobile, twinkling branchlets of birches from thirty to seventy feet high is to find fragrance, light, and shadow in a pleasing and refreshing blend, seldom furnished by any other tree. In all hours of the day and seasons of the year the birch provides new relays of freshness and beauty. At sunrise, sunset, and noon; in spring, summer, autumn, and winter the Lady of the Wood earns her popular name by retaining much of her charming grace and versatility. The birch is one of the earliest blooming of our hardy trees; the flowers are small, and appear in February or March, male and female on the same tree. The male flowers are light brown and loosely pendulous; the female green, tipped with crimson stigmas, in the way of, but smaller than, filberts or common hazel nuts. The seeds after maturation assume the shape of minute winged nuts. The leaves of the birch are the personification of grace and beauty; the early leaves are distinguished by their freshness and grace, until the autumnal sunshine paints them with coats of many colours, and in various proportions of red, gold, and scarlet.

As the trees advance in bulk and age, the twigs or young shoots often assume a more purple hue, and the trees produce larger and more curious "bird nests," a common name given to the curiously stunted or abortive branches of birch trees—which, however, I have never known birds to use for nests, so that it is as vain for the birch trees to grow their imitation nests in sight of the birds as it is for the fowler to set his snares in their sight. But these quaint imitations of birds' nests by birch trees is one of those curiosities of tree life that add greatly to the interest of avenue and wayside trees. Neither is the cause of it quite cleared up by the orthodox botanical solution—suppressed development. It may be so, but why just there and then, and for what possible purpose, if no bird will use the curiously malformed birch branch for a nest? Can these be grown for seed baskets, to collect and store the winged seeds for dispersion later on by March winds, and so secure a wider and more general seed bed for the extended growth of these charming trees?

Young birches grow rapidly under liberal conditions, making from two feet to thirty inches growth a year. But they are most effective and characteristic when grown much more slowly. Single trees, groups, and woods of birches are also beautiful; but avenues, or hedgerows clothed with birch, accentuate and multiply their gracefulness. Birch in woods and avenues, by moonlight, and in gardens, parks, and landscapes, are simply bewitching. And as to the odour of birch, no one, so far as I am aware, has succeeded in describing one half of its unique freshness or inexhaustible fragrance.

Birch timber and bark are largely used in our industries, and prove as profitable as that from other forest trees.

D. T. FISH.

The New York Botanical Garden, now in course of development, occupies, as already stated in these columns, about two hundred and fifty acres of the northern part of Bronx Park. After several years of agitation, inaugurated and influenced by the Torrey Botanical Club, the sum of about £5,300 was in June, 1895, raised by public subscription, and the Board of Estimates and Appointments was authorised to issue bonds aggregating £104,166 for the construction and equipment within the grounds of the necessary buildings. Much has already been accomplished in grading, planting borders, establishing a nursery, and accumulating herbarium, museum and library material. By an agreement with Columbia University the herbarium and botanical library of the University will be deposited in the garden. Reservations of suitable extent and location have been set apart for decorative grounds, forest areas, meadows, pinetum, deciduous arboretum, fruiticetum, viticetum, herbaceous grounds, rockery, economic garden, bog garden, and ponds. The range of horticultural buildings to be erected comprise thirteen houses, covering about 45,000 square feet. A circular palm house, one hundred feet in diameter and ninety feet in height, is the central feature, and the houses are so arranged as to enclose a large court that will be utilised for aquatic planting and other ornamental features. The houses occupy a commanding position upon a broad terrace. We learn from *Gardening* (Chicago) that the tract of land devoted to the garden is an ideal one for its uses. Its surface is undulated, and it includes all degrees of shade and of exposure to sunshine and moisture, and a soil that is remarkably good throughout. The families of plants in the various departments will be arranged in a sequence following the latest system of botanical classification. The Bronx river, with its overhanging banks and damp glades, will furnish an appropriate home for the ferns and moisture-loving plants, which cannot be located in formal beds, and will also add beauty to the landscape and features. Our American contemporary gives some charming illustrations of river views, and of the beautiful natural features of the locality. The chief work in the garden during the past summer has been on the border, which is to enclose it, making a thick plantation of trees and shrubs, sloping down from the outside and shutting out objectionable views where such exist. This border when completed will be about two miles long, and comprise some three hundred and fifty species or varieties of trees and shrubs planted under the direction of the superintendent, Mr. Samuel Henshaw.

WHY IS NOT THE GLADIOLUS POPULAR?

"BUT is it not popular?" some will ask. "I think it a very handsome flower, and am always pleased when I see grand collections of it staged." That may be truly said by a great many, but with all that I aver that it is not popular. There are two ways in which this assertion may be proved. In the first place, who ever sees a collection of them grown in either private or public gardens? I have seen a good many gardens, but I cannot call to mind one in this part of England, at any rate, where named varieties are to be found in any quantity, or where any enthusiasm is shown in their growth. How different it is with really popular flowers! Take, for example, the rose and the chrysanthemum. We have national societies which concern themselves only with these flowers; we have special exhibitions of which they are the sole flowers exhibited; we have affiliated societies dotted all over the country, and nurseries where, if they are not the sole, they are, at any rate, the chief object of culture; but none of these things can be said of the gladiolus. There is no society especially interested in it, for the very simple reason that there are no cultivators who would support it.

There is another test of popularity, namely, exhibitions. There have been spasmodic attempts from time to time to galvanise it into life. The Rev. Joshua Dix many years ago got a sum together for the purpose of offering special prizes for it, but the attempt, in the hands of even that genial and popular florist, was a miserable failure, and it was never repeated. During the forty years that I have grown the flower I have never seen, where there was an amateurs' division, more than three or four exhibitors. I need hardly say how different this is to the rose and chrysanthemum, where exhibitors may be counted by hundreds. During that time I have seen many an ardent horticulturist successfully competing. I can remember the fine spikes that Lord Hawke would exhibit, and collections staged by Mr. Herbert Fowler and Mr. E. B. Lindsell; but I have seen all these and many others "throwing up the sponge," and retiring from the field. The rose grower may get tired after a few years, and you see him no more, but there are always others to take his place, and so with the chrysanthemum grower, we may miss the names which in former years were always attached to the principal prize cards, but then others have taken their places, and so the interest in them never ceases. I do not think these facts can be controverted, and, as I am the only amateur that I know of who during these forty years has held his ground, I think I may be credited with knowing something about gladioli.

What, then, are the causes which have contributed to this end? or are there no causes, and must it be attributed to caprice? To this I reply there seem to be many and sufficient reasons for it. In the first place, it is a troublesome bulb to grow; the soil most suited for it is a good strong loam, much the same as we find best suited for strawberries and roses, therefore in light soil it is apt to be a failure. But, supposing you have a suitable soil, see what trouble it involves; you must have each of your spikes staked and tied, that is if you wish to have them straight and well formed; this tying must be done two or three times. Where amateurs grow for exhibition they must use shades or wooden cases, which are placed over the flowers; these latter are expensive and difficult to manage. Then, when the bulbs are matured, they have to be taken up and placed in an unheated greenhouse, or some such place free from frost, and when sufficiently dried the earth and old roots have to be taken away and the bulb cleaned and put into its winter quarters. All the smaller bulbs, if it is wished to continue a collection, must be taken off from the base of the old bulb, and placed in paper bags or small boxes, there to remain until the spring, when they are to be sown in drills like onions; they will probably come (most of them) into bloom in the second year. The flowering bulbs must be kept separate, either in an open trellis case, in bags, or on the shelves. I do not think bags are very desirable, as they are apt to stimulate root formation, which is bad. If gladiolus are troublesome to grow, they are equally troublesome to exhibit. Many plans have been devised, and I myself have spent both time and money in providing cases to take them to the exhibition. The best plan, however, I think, is to place them standing upright in cases covered with tiffany or light canvas, and then when you get into the place of exhibition you have to take them out of the cases and place them in stands with tubes especially prepared for them, so that they can stand upright, and not fall about upon one another, and I believe that this is one of the chief causes why there are hardly any amateur exhibitors. I have for many years exhibited at the Crystal Palace, and I can speak from sad experience of the trouble that it is to take even a stand of twelve and place them on the exhibition stage in time for the judges. The happy exhibitor of chrysanthemums or dahlias can arrange his flowers in the trays in which they are exhibited, and when he arrives at the place of exhibition has only to draw out his trays and place them on the stage. Even the rose exhibitor has not so much trouble. He places his flowers in the tubes in the boxes. Doubtless several of them may have to be removed, and their place supplied by some of his "spares," but this is not at all equal to the trouble which devolves on the gladiolus exhibitor.

But the most formidable obstacle to the growth of the gladiolus is unquestionably the fact that a considerable number of the bulbs perish every year, and from what cause has been a matter of controversy. Some maintain that it is from exhaustion, that the bulbs have been so long in cultivation that their vigour is gone. I do not believe this, for you may have a dozen bulbs of a variety, two or three of which perish, while the others remain sound; and, again, I have received bulbs this year of new varieties, not yet sent out, from the raisers at Fontainbleau, and some of these have gone off in the same way. Others speak of it as the degeneration of the bulbs. This comes to very much the same thing, and for the same reason I do not think it is tenable. The bulbs become simply a mass of rottenness and decay, and some years ago I submitted some bulbs to one of our most eminent mycologists, who, after careful examination under the microscope, described the attack as a fungoid one, very similar to that which sometimes affects the crocus plantations in Holland, and occasions severe losses. For this disease I have tried various preventives, but I have never found one of them to be of the least avail, for if when you lift the bulbs you see the least speck on their smooth surface it is most probable that when you put them by in their winter quarters you will find that this spot has spread, and the whole bulb is destroyed. Still more curious is the fact that a bulb will sometimes throw up two shoots, one of which will produce a sound bulb and the other a diseased one; of course, when you give half a guinea or a guinea for a bulb, this is very disheartening, and cannot long go on. I have known growers for sale who have spent considerable sums in endeavouring to get up a collection, but who have been obliged to abandon the attempt.

It may be said that all these facts are very discouraging, and so they are, but there are two ways of meeting the difficulty; one is that to which I have already alluded, viz., saving the young bulbs and growing them on from year to year; the other is that of purchasing unnamed seedlings, which can now be had of excellent quality. Formerly, when growers sowed their seed without any attempt at cross fertilisation, mixed seedling bulbs were a failure, but now that English growers have been carefully hybridising their flowers the case is entirely different. If anyone had noticed the fine stands of flowers shown by Messrs. Barrell and Co., of Cambridge, and Messrs. Harkness and Son, of Hitchin, at the Aquarium not long since, he would have seen what a large number there were without any names attached to them, and many of these I venture to say were quite equal to the French varieties sent out of late years, and then a hundred of these can be obtained for the price of one bulb of a new variety sent out by the French firms.

I have been sometimes asked why I put these unpalatable facts before the public; my reply is simply that I do what I think is for the best interests of horticulture. Nothing is gained by trying to live in a fool's paradise, and assuredly he does so who thinks that growing a collection of gladiolus involves neither trouble nor disappointment.

H. H. D.

RASPBERRIES ON NORTH BORDERS.

BY various methods and with the newer varieties it is now an easy matter to prolong the strawberry season, but with raspberries the case is different, though where autumn-fruiting varieties are grown fruits may be had well into the autumn. This year we have gathered good fruits of Superlative from young shoots much later than on other kinds; indeed, this variety appears to be an excellent late fruiter, and if planted on north borders it gives a large quantity of later fruits. All may not be able to devote a north border to raspberries, but they may plant a few under trees, though the results are not always then satisfactory, especially in a wet season. One often sees all the raspberries in the same position, and the crop then matures almost all at once. This may suit market growers, but in gardens where fruits are needed in quantity over as long a period as possible there is a great gain in having later quarters and varieties, and in such cases the advantage of a north border is great. No matter what position they are grown in, raspberries succeed best in a good loamy soil. With good culture they will thrive on gravel, but they need more food, moisture, and general attention. In good holding soil I have had most of the canes as thick as stout walking-sticks when grown on a north border in the northern part of the country, and, owing to their success, we had no need to grow autumn fruiting varieties, for by pruning them hard they bore grand fruits well into September. At the time named the newer Superlative was not in existence, and I feel sure this variety will be one of the best for the north border. The varieties we formerly grew were Northumberland Fillbasket for dessert, and Semper Fidelis for cooking, the latter producing a splendid fruit somewhat more acid than others, and having a rich bright scarlet colour. It is in free fruiting and one of the most continuous croppers anyone could grow.

The newer Superlative is superior, as regards cropping qualities, to the Northumberland Fillbasket, but, of course, there is quite a different soil to deal with here, as it is very light, resting on a gravel subsoil, yet Superlative makes a much better growth than any other variety. Semper Fidelis is a good grower, but not equal to Superlative, which is good even in adverse seasons.

In previous issues of the Gardeners' Magazine I have pointed out the importance of good cultivation, and, what in some gardens is often overlooked, the advantages of occasionally planting a new quarter to replace old worn-out plantations. A certain amount of pride is permissible in a grower who can point to a quarter that has been continuously cropped for a quarter of a century, but in many such cases it would have been more profitable to have created new quarters of young plants, and secured heavier crops. The raspberry soon impoverishes the soil, and we find it much the best to make new quarters previous to the middle of December; if the weather is open, I prefer early in November, if possible. Ample manuring is a necessity, and more so if the land is poor; indeed, with poor soil it well repays the cultivator to add some new material, removing a good portion of the poor, inert soil, and getting the land in condition some little time in advance of planting. Canes for north borders should be strong ones. Some varieties, such as Superlative, make a strong growth in a short time, and we have had a fair lot of fruit from it the second year after planting; but to do it justice plant early in the autumn, and secure strong plants. We do not wait for the leaves to fall, but endeavour to obtain a good mass of fibrous root.

Last season we gave a trial to one of the yellow varieties, New Guinea, a splendid form, that recently received an award from the Royal Horticultural Society; it is well worth growing for dessert. It was raised from Superlative, and like it is a free, strong grower, having large foliage and handsome fruits. I am sure more white raspberries could be grown in private gardens, but of late years they have not received much notice. Magnum Bonum is also a good variety in our light soil.

G. WYTHES.

Syon Gardens.

CHRYSANTHEMUM H. J. JONES.

UNQUESTIONABLY the most brilliant-hued Japanese chrysanthemum brought forward this season is the grand variety raised by Mr. J. Shrimpton, gardener to W. Seward, Esq., The Firs, Hanwell, and exhibited by him at the Floral Committee meeting of the National Chrysanthemum Society held on November 14. This fine form has been named after Mr. H. J. Jones, of the Ryecroft Nursery, Lewisham, who, we understand, has acquired the stock of it. The illustration in the present issue serves to show the massive proportions of this excellent exhibition variety, and also indicates the elegance of the spreading, broad, substantial, and flattened florets. The beauty, distinctness, and brilliance of the colouring is the principal feature of the new comer, and those who know the many grand crimson forms Mr. Shrimpton has already raised will be surprised to hear that the shade seen in H. J. Jones has not hitherto been equalled for effect. The florets are intense and brilliant crimson, a shade in which a good deal of scarlet seems to be mixed; the reverse side is pale coppery-bronze. It is hardly necessary to state that the variety gained a first-class certificate from the N.C.S. Growers should remember that this new Japanese chrysanthemum is not Mons. H. J. Jones, nor Mr. H. J. Jones, but H. J. Jones; there is no need for a handle to the name of such a variety.

FLAVOUR IN PEARS.

THE flavour of pears has been of a very high quality this season, for which we are indebted in a great measure to the brilliant and extremely warm weather experienced during the latter part of the summer and early autumn. The heat, combined with judicious root waterings and surface feedings in the shape of artificial manures, has also led to many sorts attaining large size, and they have also developed clear and smooth-looking skins generally, while during the three or four weeks previous to the ingathering of the mid-season kinds they attained a high degree of colour. This has been so pronounced in many instances that persons unacquainted with the nature of the soil and locality would incline to the opinion that the fruits had been produced under glass.

With these few preliminary remarks I will give a list of varieties, with brief comments, which have been found exceptionally high flavoured. This list will be by no means an exhaustive one, but will, as has just been stated, include the cream of the sorts which have ripened up to date or are within a few days of being ready for table. The first on the list is Beurré Giffard; in some seasons this is rather insipid, in others mealy, but this year it was exceedingly good and richly flavoured. The fruits were produced by cordon trees, and grown on a south-west wall. Colmar d'Eté, from a pyramid, followed closely, the fruits being fine in size and highly coloured; in most seasons this pear is rather crisp eating, but on this occasion it was quite melting and delicious. Jargonelle is so invariably good irrespective of seasons that no further comment is necessary. Williams' Bon Chrétien was very large and beautifully coloured, from cordons on a west wall, and was succeeded by those gathered from bush trees out in the open garden. Here again the flavour was all one could wish, and so was that of Souvenir du Congrès, a pear somewhat similar in appearance and flavour, though much larger in size. Clapp's Favourite, a very handsome fruit, was also extremely good, especially from a pyramid on the pear stock. Next came Gratioli of Jersey from a bush tree, closely followed by the same variety from cordon trees on a west wall, which receive a good deal of shade from a plane tree growing some distance from them. The flavour in this case was extremely good, and the same remark applies in an equal degree to Beurré d'Amanlis, the fruits of which were extra large and carried a bright crimson flush on the side exposed to the sun. This is a fairly good keeping pear. and by gathering at intervals the supply can be spread over several weeks. This sort lasted until the extra highly flavoured Thompson's came into use. The crop of this was an excellent one, and there still remain a few fruits of it in the pear room at the time of writing, which are in good condition. This really succeeds better either as a bush or pyramid than when grown against a wall. Duchesse d'Angoulême ripened next, and has been a great success. In some seasons it is only half-melting and gritty, particularly if the trees are on the pear stock, but this year the flesh was melting and the flavour rich and luscious. Perhaps it is only fair to add that it is grown here in a bush form, and worked on the quince stock, and it is from such trees that the best results are to be obtained with this variety. Its near relative, Pitmaston Duchess, grew to large dimensions, and has perhaps never been better flavoured. Alexandre Lambre, too, must not be forgotten, as both the size and flavour have been first-rate.

Beurré Hardy, which is such a regular cropper, is now in use; the fruits are very fine and high coloured, the flesh melting, juicy, and rich. Beurré Superfin is ripening fast, in fact some fruits are already fit for table, and are first-rate, which is invariably the rule with this variety. Before these lines appear Doyenne du Comice will be over; it has done remarkably well, the specimens being very large, highly coloured, and exceedingly luscious. Durondeau, as usual, is conspicuous by its rich, reddish-brown coloured skin, while in point of size it is equal to those produced in former years. This pear requires a thoroughly warm summer and autumn to render its flesh quite buttery, and to free it from the rough flavour which characterises it in some seasons. This year it is first-rate. Maréchal de la Cour is now in perfection, and I have sent fine fruits of it to table the last few days. There is a marked distinction in the appearance of this pear when grown against a wall and out in the open garden. In the first case the skins are quite smooth, and in the latter russety and rather rough, but as regards flavour matters are equal. Marie Louise will be ready in a few days, and, as this is always of high quality, it may be taken for granted that it will this season prove no exception to the rule. A new pear to me, which has fruited for the first time here, is Beurré Alexander Lucas, which in point of flavour is equal to any of the foregoing varieties. To succeed Marie Louise, and to carry us on to the end of the year, we have Althorpe Crassane, a good old pear, which usually lasts in good condition a considerable length of time; Beurré d'Anjou, Passe Colmar, Nouvelle Fulvie, and Beurré d'Aremberg. About the end of December Winter Nelis, Zepherin Gregoire, and Knight's Monarch should be ready, to be followed by that grand mid-winter pear, Glout Morceau, the fruits of which are extra large and the crop a heavy one this season.

Stoke Edith Gardens. A. WARD.

NEW AND SCARCE HYACINTHS.

NEW varieties are constantly putting in an appearance, but it is difficult to obtain anything that is a marked improvement upon the fine varieties already in cultivation. Time is required to bring seedling hyacinths into flower, and when they have bloomed, and appear to be of a promising character, they have to be put to a severe test to show actual advance and constancy; these assured, the work of propagation is then prosecuted with vigour, in order to secure sufficient stock to enable them to be distributed.

The novelties I have seen during the past two or three years are Atchina, single, red, the colour of Koh-i-Noor, but a more massive spike, and therefore it may be regarded as an improvement upon it. Cardinal Wiseman, single, red, is of a rich deep pink or pale rose, and throws a massive spike, one of the largest among the single varieties; it is very pleasing in colour. Enchantress, single, blue, is a lovely pale blue in the way of Czar Peter, but with a longer spike; a fine addition to a section which already includes some charming types. Isabella, double, white, is a magnificent variety, the blossoms perfectly double, the spikes close and compact, symmetrical, and very fine for exhibition. La Belle, single, blush, also known under the name of Jacques, is something in the way of Grandeur A'Merveille, with a massive spike; but it is likely to be high priced for a few years. L'Espérance, single, blue, is of a rich dark purple shade, and throws a very fine symmetrical spike; it deserves to be included in a select collection. McMahon, single, yellow, is pale soft yellow, and for one of this section produces a very fine solid spike, but it is not so deep in colour as City of Haarlem, single, yellow, which obtained an award of merit at one of the meetings of the Royal Horticultural Society, and is the deepest and most refined yellow. Marchioness of Lorne, single, yellow, is of a delicate salmon-buff colour, quite novel, and every way desirable; it is perhaps a seedling from Duc de Malakoff. Pink Perfection, single, red, or soft pink, is an improvement upon Gigantea, and produces a handsome massive spike. Rosea maxima, single, red, is in the same way; it is of a lovely shade of pale soft pink, and will be generally appreciated. Stanley, single, red, is of a deep pink tint, and throws a compact, handsome spike, not large, but it is one of the best light reds in commerce; unfortunately the bulbs are small, and it is generally thought that a small bulb produces a small spike. Souvenir, single, blue, is of a rich porcelain blue, and forms a compact, symmetrical spike. Queen of Naples, single, red, is of a rich deep rose, the bells having a pale centre, and it appears to be a decided best over King of the Reds. A decided acquisition, T. Cremar, single, blue, is an improvement on Lord Palmerston, which is of a lovely soft blue, because it throws a better spike; but those who grow Lord Palmerston will not soon give it up, because of its delightful soft tint. Waterloo, single, red, a name which was given many years ago to perhaps the oldest of the double red varieties, is of a rich pale coral pink shade, paler than Norma, and likely to become a general favourite.

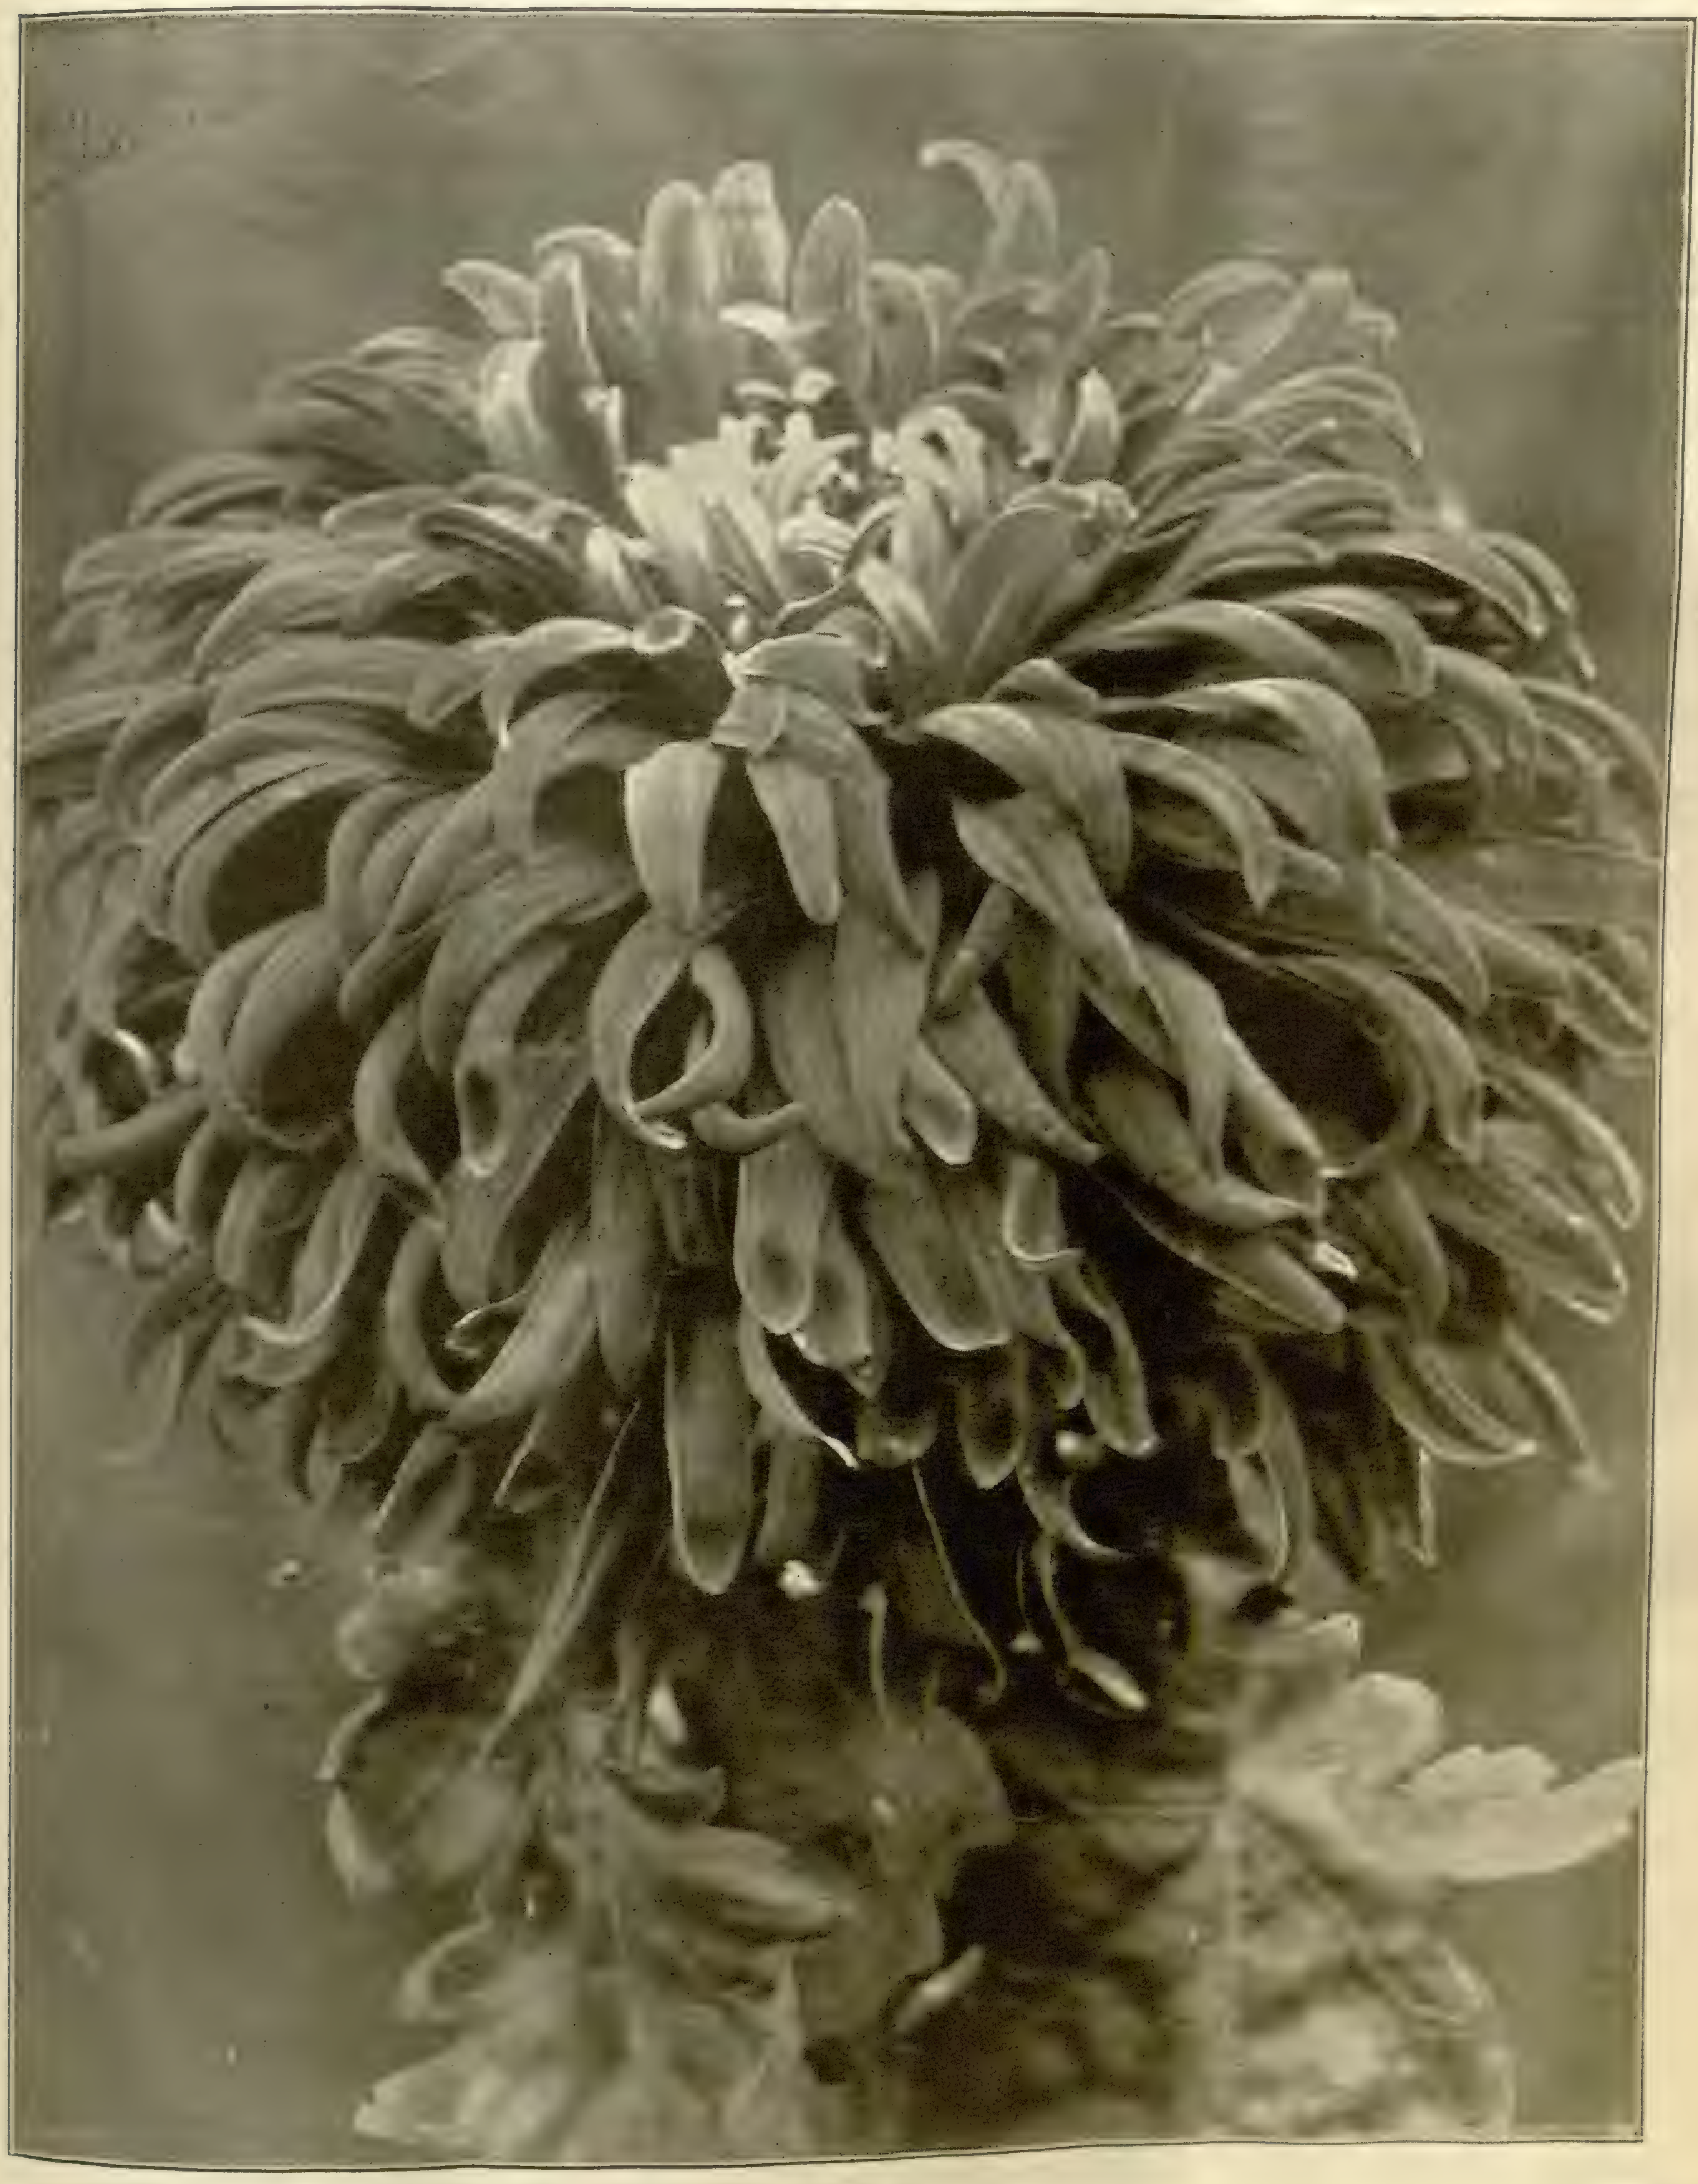
A very fine selection of hyacinths for house decoration and exhibition purposes will be found in Czar Peter, Captain Bovton, Grand Maître, King of the Blues, the best true blue; and William III., an improvement on William I., all single blues; Fabiola, Lord Macaulay, Moreno, a charming and most constant coral pink variety; pink Charles Dickens, like its blue namesake, always to be depended upon; and Roi des Belges, single reds. Balfour and Sir W. Mansfield are two single purple or claret shades, and the best of the section. La Grandesse, L'Innocence, and Mont Blanc are all pure single whites of great beauty; also Grandeur A'Merveille and Leviathan, single blush. King of Yellows, Ida, and Heroine are the best single yellows.

Three-quarters of a century ago the double hyacinths were all the rage, and there were but very few single varieties in cultivation. The reverse holds good now, yet there are some who like to have a few double varieties in their selection. To such the following may be confidently recommended: double red, Princess Louise, the darkest, and very fine; Groot Vorst, blush, a very fine old variety; Lord Wellington, a delicate blush pink, with very large and handsome bells; and Noble par Merite, rose; La Tour d'Auvergne, white, also a very old variety; and the old Anna Maria, with its fine shaped bells and dark centre; Bloksberg, Charles Dickens, Laurens Koster, blue, and Victory, a new and fine variety of a purple shade. There are no double yellows worth mentioning.

Varieties which naturally flower early will be found in La Tour d'Auvergne, double; Alba superbissima, and Blanchard, single, white; Amy, General Pellissier, and Norma, single, shades of red and pink; and Bloksberg, blue. The hyacinth still holds its own as a highly popular spring flowering subject.

R. DEAN.

A Pear within a Pear.—Examples of this not uncommon monstrosity have been recently exhibited by Mr. W. J. Clarke, Manor House, Benbrook, Market Rasen, and Mr. J. T. Bennett Poë. The pear has no core, but in its place the apical bud develops into another pseudo-pear. The terminal bud then attempts to produce a third or more; finally a tuft of small leaves at the top represents the still growing terminal bud.



CHRYSANTHEMUM H. J. JONES.

DO CHRYSANTHEMUMS WEAR OUT?

ON the whole I endorse your Editorial remarks under this heading that appeared in the issue of November 19th. There can be little or no doubt that among chrysanthemums, as among other plants, and most animals also, over-feeding tends to weakness, exhaustion, disease, and death. Through this cause horticulture has lost many rich and valuable treasures, and there can be little doubt that far more of our valuable plants have been fed, rather than starved, to death. Starvation rather stunts growth than destroys life. Probably, then, the Queen of England and many other favourite chrysanthemums, incurved or otherwise, have suffered considerably and lost much vigour of constitution through the extreme concentration of vital force in the plant by the modern methods of culture. I was much impressed by the remark of one of our greatest authorities the other day, to the effect that plants capable of furnishing one perfect bloom would generally furnish at least three as well, or better. If this be true, as I believe it is, what, then, becomes of two-thirds of the vital force of the plant? We cannot blow it off as the engine driver does his waste steam. Neither can it always be grown off in seasonable shoots, which may mar the perfection of our blooms, as well as enfeeble the constitutional vigour of our plants.

The intense concentration of force into limited areas, being unnatural, is always accompanied with more or less extra risk or danger to health and life; hence, if two-thirds of the force of a chrysanthemum is allowed to run to waste, what more certain than that this waste—which may be defined as vital force in the wrong place and state—should induce disease or shorten life? An excess of vital force or unappropriated protoplasm is as likely to weaken the health and shorten the longevity of chrysanthemums or other plants as excessive feeding; in fact, they amount to the same thing. No, varieties do not die out through the lapse of years, though they mav be stuffed out through excess of food or choked through having protoplasm sufficient for a dozen blooms crammed into one stem and flower.

But the decline of incurved chrysanthemums, which most of us have noted and regretted, is capable of a more simple explanation. We have fashions among chrysanthemums, as in ladies' dresses or bonnets. So for some years past, and now more than ever, the Japanese forms have been and are still all the rage, but instead of turning penitently to our older loves, the incurved, we are welcoming decoratives and single varieties, almost calling those dwarf Chusan daisies back again. Another revolution in the whirligig of fashion will call the incurved varieties back. At present they are suffering from neglect, and it is hoped that all our finer incurved varieties will return before any of them are lost. Cultivators have only to put their love and skill into the work and incurved flowers will hold their own with the best Japanese.

D. T. FISH.

CHRYSANTHEMUMS IN ITALY.

READERS of the GARDENERS' MAGAZINE will no doubt remember that early in the present year the formation of a National Chrysanthemum Society for Italy was announced. The popular autumn flower has been grown there for some few years, and there is no doubt that the residence of Mr. Briscoe-Ironside, a well-known amateur and great enthusiast in all matters pertaining to the flower, has in no small degree helped to quicken the interest that is now being taken in the chrysanthemum in Italy.

Several gardeners and nurserymen in that country have taken up the subject of seedling raising, chief of whom perhaps is Mr. Alexander Scalarandis, gardener to the King. Then there are others, such as Messrs. Radaelli, Longhi, Ragionieri, Baragiola, &c.

During the past season three shows have been held, viz., at Turin, Pallanza, and Milan. The first was a great success, and was visited on the first day by the King and Queen. Thousands of pot plants were exhibited, and these were mostly remarkable for their dwarfness, hardly any being more than two feet in height. At this show the leading prize-winners were Messrs. Scalarandis, Radaelli, Brocchi, and Briscoe-Ironside.

Pallanza was the scene of another show, although somewhat smaller in extent. Besides showing cut blooms, Mr. Ironside set up an imposing group of pot plants twelve yards long by six yards wide, comprising several hundred varieties, the whole being interspersed with palms, dracænas, foliage and other plants, and here too, as at Turin, Mr. Ironside was the recipient of a medal and diploma in recognition of his display.

The chief interest perhaps to English exhibitors centres itself in the efforts of the Italian N.C.S., whose first annual exhibition was held at Milan from November 10 to 15. It took place in the Fine Art Gallery, and a finer and lighter and more suitable building for such a show would be difficult to find. There are two floors, several passages, besides committee and refreshment rooms, and the walls being covered with pictures gives an additional source of interest to the visitors. The floor space in all is probably equal to that of the Royal Aquarium at Westminster, and it was well filled, the majority of exhibits being pot plants. Mr. Briscoe-Ironside had a room to himself, which he filled with an exhibit with examples of every section of the chrysanthemum, and also with plants. For this he was awarded a gold medal.

The Floral Committee held a meeting, but awarded only two first-class certificates. These went to Mr. Ernest Calvat for the following—Princesse Bassaraba de Brancovan, a large Japanese of the C. B. Hayward type; and Lesdiguirex, also a Japanese of large size, pale orange streaked crimson. At the show there were eighty-four competitors in the forty classes, and after the proceedings of the first day were concluded a banquet was held, at which seventy guests were present, including a delegate from the newly-formed Swiss N.C.S.

C. HARMAN PAYNE.

WONDERS WILL NEVER CEASE we are told; but it cannot be denied that Holloway's Pills are the greatest wonder of modern times. They correct bile, prevent flatulency, cleanse the liver, and purify the system, strengthen the stomach, increase the appetite, invigorate the nerves, promote health, and reinstate the weak to an ardour of feeling never before experienced. The sale of these Pills throughout the globe astonishes everybody, convincing the most sceptical that there is no medicine equal to Holloway's Pills for removing the complaints incidental to the human race. They are indeed a blessing to the afflicted, and a boon to those who suffer from disorders, internal or external. Thousands of persons have testified that by their use alone they have been restored to health, after other remedies had proved unsuccessful.—[ADVT.]

FRUITS FOR COTTAGERS AND SMALL FARMERS.

THE criticisms by the Rev. E. Bartrum, D. D. (p. 770), on the selection committee of the R.H.S. are somewhat severe. There is, however, much truth in what he says and considerable room to doubt the choice of varieties (in many instances) in this latest selection. In criticising all selections of fruit due regard should be paid to local conditions, such as soil, situation, and market requirements. All of these are factors that cannot be lightly disregarded. For instance, Lord Suffield is the best kitchen apple in commerce where the soil is suitable. In other districts, where the soil is heavy and retentive of moisture, this apple will scarcely exist, let alone flourish. Market requirements too need deep consideration. For example, Ecklinville Seedling is quite useless with some fruiterers, who regard it as much too "soft" in the skin and flesh also. For home consumption for the large establishment and for the cottager this cooking apple deserves a place in even the smallest collection. As a bush tree it is perfection, as its habit of growth is all that could be desired, being free yet compact, and as such it should be included in the R.H.S. list. I agree with the Rev. Dr. Bartrum that Blenheim Pippin is an excellent cooking apple, and well deserves a place. Apples that can be eaten, when cooked, without the addition of sugar to make them palatable to all tastes are to be encouraged, and this is one of them. At one time I held a strong objection to Blenheim Pippin, owing to its shy cropping propensities in a young state, but now, after from fifteen to twenty years' growth, I regard it as indispensable; when once thoroughly established it appears to be less influenced by climatic conditions than any other apple, as it gives a crop of fine fruit annually.

The reverend gentleman seems to have missed the substitution of Lord Grosvenor for Lord Suffield, as a bush, by the R.H.S.; with this alteration I quite agree, as the former is much more trustworthy than the latter in a variety of soils. I regard it as quite the best apple for market in August and September. Grenadier with me is shy in bearing. Sturmer Pippin can well be spared from any list, as it has but its free-bearing properties to recommend it, while in flavour it is quite third-rate. Duchess of Oldenberg is one of the best apples for espalier training possible to find; its growth is just what is required, as it produces spurs freely. As a bush, too, it is a desirable form. I should not think of planting this apple as a standard in a position at all exposed to south-west winds, as the fruit at all stages of growth is "soft" and easily damaged. I agree with the committee in placing Alfriston in the list of selected standards; it is a grand apple, free bearing, shapely, keeps well, and is of the finest quality as a cooking variety. Tower of Glammis is not a good grower, being somewhat sparse; perhaps this is why it was omitted by the R.H.S. Cox's Pomona is indeed a strange selection for the dessert; it is as bad as the admission of Wealthy as a dessert variety at exhibitions. Cox's Pomona is a really good market apple, as its handsome colour will sell it anywhere, though hardly a second time, for dessert, to those who consider flavour a desirable stipulation. In my opinion Pott's Seedling is hardly sure of its position, as it is prone to canker in retentive soil, and this should be a strong argument against any variety being included.

Stirling Castle, although one of the most free-bearing varieties, requires much assistance in the way of stimulative food to render its growth free enough to give the best results. It may not be generally known that Lane's Prince Albert is one of the best varieties in existence to plant as a standard; its growth is of that semi-weeping character desirable in a large, well-furnished head on a full or half standard. Mr. Gladstone is much too small, I think, for a typical dessert fruit. Beauty of Bath will prove to be more desirable, and also Red Astrachan. Worcester Pearmain, I see, is included in both selections, bushes and standards, and rightly so when its free cropping and showy appearance are taken into account. If I were confined to one apple for market use I should select Worcester Pearmain, as it is one of those apples that will bring a high price in September, and there is no trouble in storing or loss by wind. No one will dispute the rights of both King of the Pippins and Cox's Orange Pippin to both lists, as both sell readily. Gascoigne's Scarlet I cannot regard as a dessert apple. In the first place it grows too large, and its flavour is quite third-rate. I should replace it with Rosemary Russet or Fearn's Pippin if a late variety were wanted. If this was not imperative I would include Benoni, an eating apple not nearly enough known, but which will in a short time work its way to the front. In appearance it much resembles King of the Pippins, is a trifle flatter on the top, has broader streaks of red on its chest, and ripens between Worcester Pearmain and King of the Pippins, just at a time when dessert apples are exceedingly scarce. In point of flavour it excels King of the Pippins. It is a free cropper and has an upright growth, so that thick planting can be practised with safety.

Swanmore Park. E. MOLYNEUX.

APPLES FOR SMALL CULTIVATORS.

I HAVE no intention of defending the R.H.S. Fruit Committee from the onslaught made by the Rev. Dr. Bartrum on the new "Fruits for Small Growers" pamphlet. That body needs no defence; but it is fair to say that only a limited number of its members, collected from, so far as possible, all parts of the kingdom, are responsible for the lists criticised. It is all very well to say that the new lists include too many varieties, but, while one critic thinks only of those varieties that do well with him, others think of those and diverse ones that do well with them. Hence, when the committee which arranged and reorganised these lists of varieties met some time since, the difficulty encountered was not so much paucity of recommendations as that so many excellent varieties, quite first-class in one part of the country or another, were suggested, and from out of the whole the present lists were formed because essentially representative of the kingdom at large. But everyone knows that beyond these very limited lists there are scores of varieties that are held to be good somewhere. Then the lists were remodelled to show varieties somewhat in the order of ripening, which is an advantage over the alphabetical order. Then the removal of such a very strong growing apple as Blenheim Pippin from the general list to the standards is most wise, because it is quite unfit for the bush method of culture. But, as the lists now give both bush trees and standards, that also necessitated longer ones. Small cultivators need, in gardens, moderate growers, early croppers, and general or reliable croppers also. These the lists give. No human being could give a list of the best half dozen apples for every soil, situation, or district in the kingdom. Growers must of necessity do something from the lists to find out the rest for themselves.

A. DEAN.

WORK FOR THE WEEK.

COOL ORCHIDS.

COLD weather having now set in more fire heat will be needed in the cool houses, but the temperatures this month will reach their lowest points, and should be as follows: Odontoglossum house, 45 to 50 degrees by night and 50 to 55 degrees by day; masdevallia house, 48 to 50 degrees by night and 52 to 58 degrees by day. The object of every cultivator should be to manage with the least amount of fire heat possible; rather let the temperature fall a few degrees than have the pipes excessively hot. On the morning of November 22 our outside thermometer registered 10 degrees of frost, while the temperature of the odontoglossum house was 45 degrees; this was followed a day later by a severe snowstorm and cold, cutting winds—a sudden change, indeed, after such a long spell of mild weather. In such very cold weather the lower portion of the roof and ends of the houses should be covered with Archangel mats, pieces of sackcloth, or any material that will result in a difference of five to eight degrees in the warmth of the house, for by so doing less fire heat is necessary, a saving of fuel is effected, and at the same time a much more healthy condition within the house is maintained. Whatever is chosen as a covering should be so arranged as to be quickly taken off or put on. If Archangel mats are used the ends should be neatly tied, and two or three mats be sewn together, as these may then be easily rolled along the lower parts of the roof at dark, and taken off again at daylight; then in windy weather they may be made secure by laying strips of heavy wood upon them, or by strained cords. If during the night they become wet or frozen they should be thawed and dried before use again. With regard to damping, once or twice a day will be sufficient, according to the fire heat in use, ventilating on all suitable occasions, if only for a few hours during the middle of the day, and always allowing a little air on the leeward side of the house, except when the weather is very severe. Should the weather turn mild again, and very little heat be required from the hot-water pipes, then little or no damping on some days will be needed, as the air which can be admitted freely through the ventilators is fully charged with moisture at this season.

Masdevallia tovarensis is now in bloom, and its snow-white flowers, which appear well above the green foliage, are very acceptable at this dull season. The plants should be kept in the coolest part of the intermediate house, where the flowers remain fresh for several weeks. If the current season's spikes are allowed to remain on the plants they will produce blooms again next year, but it is better to remove them after the flowers fade, as when allowed to remain they sometimes weaken the plants. Care must be taken in watering during the winter, as over-much water at the roots causes the loss of many leaves. Trichopilia fragrans and T. laxa are two other very pretty orchids now in flower, and well worthy of cultivation on account of their delicious perfume. These plants are best grown at the warmest end of the odontoglossum house, and sufficient water should be afforded them to keep the compost just moist while they are in bloom, after which they should be kept moderately dry until growth recommences, when they should be repotted, using well-drained pots and a compost of equal parts peat and sphagnum moss. When potting keep the plants well raised, so that there will be no danger of water lodging in the young growths, for if this happens they soon turn black and decay. After repotting afford a light position, and give water sparingly until root action becomes brisk.—E. SHILL, *New Hall Hey Gardens.*

CONSERVATORY AND GREENHOUSE.

AMONG winter-flowering plants few prove more welcome than violets, both single and double varieties. Daily gatherings of these, if only in small quantities, are highly appreciated at midwinter; neither are such difficult to obtain with ordinary convenience and careful attention in the way of ventilation, &c. It is of little consequence now how strong and healthy the plants may have been when placed in their winter quarters last September. A close watch must be kept on the plants to ensure their maintaining a supply of their fragrant flowers through these short, sunless days. Damp and mildew on the one hand and red spider on the other are evils the grower has to contend with and guard against. To check the former plenty of light and ventilation is imperative, as a low, sluggish atmosphere is not only sure to set up mildew on the foliage, but what few buds do show fail to open. It is only during inclement weather that the sashes should be closed, it being better to draw them off entirely whenever possible. Where the plants are growing in heated pits the hot-water pipes may be slightly warmed during damp or severe weather merely to keep the atmosphere buoyant and dispel moisture. Bouvardias, especially the double varieties, will now be furnishing serviceable supplies of cut blooms, and will continue to do so for some weeks if the plants are kept in a fairly warm greenhouse and new growth from the base encouraged. These sucker-like shoots often produce the finest trusses of bloom, but liberal feeding at the roots is necessary, and, of course, it is only well-rooted and healthy plants which can be so treated and yield a good return.

Carnations revel in a light, airy house, but it is necessary to apply a little fire heat to assist the flowers to develop. This, together with less ventilation, necessitates a slight fumigation occasionally to check green fly, which soon attacks the tips of the young growth and checks their progress. It is just now that the sweetly-scented marguerite section proves so valuable for cutting. Flowers of all shades, and only a small percentage of single ones, are obtained from a packet of seed sown the previous spring. Some, indeed, are so fine that they equal named varieties of the tree section, and are worthy of propagation, but by securing seed from a reliable source it hardly becomes necessary to go to the extra trouble of taking cuttings; though, instead of throwing the old plants away, we have found it a good plan to select just the best, place them in a cold frame when they pass out of flower, and pot them on in the spring. The pots may be plunged in ordinary borders the following summer, where they make free growth, which can be loosely tied to neat sticks. They can be lifted again in autumn, when they commence to give a wealth of bloom directly they are placed under glass. It is not desirable to retain the plants after the second year.

The season is once more with us when it is necessary to select and put in some cuttings of different varieties of chrysanthemums. An ordinary cold frame often has to be used for this purpose; indeed, nothing could be better, providing the cutting pots are kept near the glass, and the weather does not necessitate extra covering, which, of course, keeps the interior in darkness, sometimes for days together. The better plan is to make a temporary shallow frame on the side stage in the greenhouse, covering it with panes of glass. Here the cuttings will not suffer for the want of light; they can be attended to in all weathers, and there will be few losses, which is most important at all times, but more so when new varieties are added, and for which a good price has been paid. From now onwards most plants required for the decoration of dwelling-rooms and the conservatory will first have to go through a slight process of forcing. It is much better to commence such operations in good time, so as not to subject the plants to a much higher temperature than is really necessary for them to be ready by a certain date. As a rule the less fire heat and humidity they receive the more substance there is in the bloom, and the longer it lasts in a good condition either on the plants or in a cut state. Suitable green foliage for arranging with cut flowers is not always plentiful during the winter unless the stock of fern is cut hard. To save this ordinary asparagus seed should be sown at once, either in shallow boxes or small pots. Place in gentle warmth, and when the young plants appear they should be arranged near the glass. This is an easy way of providing suitable material for the decorator, and being light and graceful it can be used in various ways with pleasing effect.—R. PARKER, *Goodwood Gardens.*

KITCHEN GARDEN.

THE wet weather of the past week has prevented working the land where the soil is heavy, but there is ample work in other quarters requiring attention. The leaves remaining longer than usual before they fell has prevented them from being collected for making hotbeds, but as they have now fallen they should be brought together for that purpose before they decay. Leaves are much more useful for making hotbeds if gathered dry, as they then retain heat much longer and do not rot so soon. At this time of the year it is necessary to have a greater bulk, to maintain the requisite warmth for forcing, than in the spring, when the days are longer and the sun has more power; it is therefore of the utmost importance that the materials used be thoroughly mixed by turning them over two or three times to cause the violent heat to pass off. Since the employment of hot water for bottom heat the same amount of care and attention has not been paid to the preparation of materials for hotbeds, but for forcing vegetables there is nothing so congenial to growth as a gentle warmth generated by manure and leaves.

Where delicate carrots are in request very early in the season the seed must be sown at the present time, as the crop will not stand too much forcing. The soil used should be moderately dry when put on the hotbed, and should be of a thickness of at least six inches, which should be made fairly firm previous to the sowing of the seed. If sown in drills these should not be more than four inches apart, as many of the roots will be drawn for use while they are small; this will allow more room for the others to develop. Parisian Forcing Gem, Inimitable, and those of that class are more serviceable, as they make up quickly and do not require much depth of soil to root in. Some recommend sowing radishes amongst the carrots, but this is a mistake, as the broad leaves of the former overcrowd the latter and cause them to be drawn up spindly; better by far have a light or two of each than sow them together. Of radishes there are numerous varieties suitable for sowing on hotbeds, but those making the least foliage should have the preference, as they do not take up so much room; and, as they are drawn when young, a greater bulk can be had from a limited space. French beans in pits that are not well ventilated will now need constant attention, for during such damp weather as we have experienced of late it is difficult to persuade the blooms to set; for this reason air should be admitted on all favourable occasions to dry up the damp.

Rhubarb roots should be taken up and stored in a convenient place where they can be covered with litter to protect them from severe frosts, for it sometimes happens when the ground is frozen hard the roots cannot be lifted when required. Fresh batches of seakale should also be introduced into a gentle heat to keep up a supply. Roots in the open quarters may be taken up and laid in under a north wall, covering a portion with litter that they may be in readiness at any time when required. During bad weather, and where room can be provided, all the early potatos should be stood on their ends in shallow boxes. The sets ought not to be unduly excited unless required for forcing, as the more robust the growth the better the results after planting. Pay particular attention to blanching endive, chicory, and other salad stuffs.—H. C. PRINSEP, *Buxted Park Gardens.*

FRUITS UNDER GLASS.

THE time is now fast approaching when those who have to provide as great a variety of fruits as early as possible in the year will find it necessary to commence operations in earnest. I have already dealt with some of these, such as grapes, peaches, and figs, but these are probably the easiest of fruits to deal with, and others will be wanted. Cherries and plums may occupy one house, as their treatment is identical, and the earliest crops of these are generally taken from pot trees, a convenient method, as by its use greater variety may be had from one house, the various sorts grown coming on in succession to each other. Slow and sure must be the policy with these, as they are both particularly impatient of much fire heat; therefore it is better to start slowly early in the season than to be obliged to drive them later. Both, too, are very subject to aphides, so cleanliness in the house is imperative; all the walls and glass should be subjected to a thorough cleansing before the trees are brought under cover. The trees will pay for a good top-dressing of rich compost; first, the top soil should be removed down to the roots and the new material rammed firmly over them. Commence forcing with a minimum temperature of something under rather than over 40 degrees, and allow a rise to about 55 degrees with sun heat. The trees may be syringed daily in the mornings, and in mild weather this may be repeated in the afternoons, but it should not be prolonged beyond the bud stage. Keep a constant look out for aphides, as some of these will probably be found lurking round the buds, even before the latter burst, and they are then easily dealt with. See that the roots are in a fairly moist condition, as they must on no account become dry. A little top ventilation should be given early on the mornings of bright days to prevent over-excitement of the buds.

Very early strawberries are generally poor things from a flavour standpoint, and to bring them to anything approaching good quality they need great care in management throughout. For this work I still stick to the old favourite Vicomtesse Hericart de Thury, which is one of the most certain of croppers in pots, and equal to any in point of flavour. A well-made mild hotbed, consisting principally of leaves, and brought up to within quite a short distance of the glass, is a great help to early strawberries. On this the plants should be stood thinly enough to prevent crowding, and if the bottom heat thus given is about 75 degrees, while the temperature of the house does not exceed 55 degrees, the roots will become active before the tops move, and this will tend to produce strong and sturdy flower spikes. Of course, the house should be a light one, with well cleaned glass. One important thing in strawberry forcing at any time is that the plants shall never become dry at the roots; the atmosphere of the house, too, should be kept moist up to the time of flowering. Before starting the plants it is wise to dip them into some anti-mildew preparation to destroy any spores that may be present on the old foliage; the sulphur which will be contained in the mixture will also have a deterrent effect on red spider. As soon as the plants commence growing, and show their buds, keep a sharp eye on them for green-fly, which, according to precedent, promise to be very plentiful during the coming season. To check these vaporise the house once a week with one or other of the nicotine vaporisers on the market.

Push on all work of pruning, washing, and tying peaches in late houses, as such work ought to be completed before the end of the year. I may again repeat a remark I often make, viz., that the best results are invariably produced by thin-trained trees, and that to leave a lot of superfluous wood or spurs is only to court troubles in the future. —J. C. TALLACK, *Livermere Park Gardens.*

THE DAFFODIL IN CORNWALL.

(Concluded from page 792.)

IT may, however, be asked, what warrant is there that all this affection for daffodils is not the unstable fashion of an hour? Why should not the daffodil be dethroned and another favourite reign? An amateur who has in his garden never less than some 30,000 of his own seedlings, a link in a chain of experimental work reaching over more than a decade and a half of years, must often have pondered this question. But after long thought and conference with the most piercing horticultural intellects I have retired into the solacing conviction that while roses are gathered and strawberries eaten the daffodil's empire will not be seriously threatened. The spring flower seems not to exist in nature, and cannot be evolved from the most fertile inner consciousness, which shall supersede the daffodil. Sumptuary laws are not for our times; though prices should mount to £1,000 a bulb the traffic will not be put down by Act of Parliament, as was the tulip craze of the first half of the seventeenth century in the Netherlands. Mr. George Monro, the salesman and prophet of Covent Garden, is of opinion that with regard to cut blooms we are but at the beginning of the demand for the best produce, that is, for the finest kinds perfectly grown and consigned to market in perfection. The costly elaboration in letter and picture of the daffodil specialist's catalogue, and the undeprecating boldness of its prices in guineas of two figures, argue that the daffodil cult is not on the wane, and the guarantee of its permanence lies in the intrinsic excellence of the flower. What other has the abundant market qualifications of great earliness in the open air; fresh and delicate colour, ability to store water in its cells and keep fresh two days without a drink, like a camel crossing the desert, and, by no means least, a flower at right angles to a long stem, so that it makes up into long bunches facing one way for display, and travelling uncrushed in shallow boxes. The outdoor hyacinth is profitless for cut bloom; it comes much later, will not bunch, and is too rank of scent in rooms. The attempts made of late to "boom" the tulip have fallen flat. The florist's tulip proper runs into the plethora of early summer flowers; its bloom is fugitive, and, to quote from a Cornish amateur, "in a quite common combination of sun and rain is ruined by a kind of small-pox."

A character which has endeared the daffodil to our gardens is that of all spring flowers it is the most lily-like. Botanically it is separated from the true lilies by certain features, as that of the seed vessel being formed outside instead of within the corolla. But the popular names "Lent Lily" and "Mount Lily" show that it has by a true discernment been recognised as a lily, a flower of queenly rank, removed from the crowd by a certain aristocratic grace of presence The first flower of note to appease our winter-long hunger, the very tips of its strong leaves are rejoiced in as they break the soil:—

> "When daffodils begin to peer,
>
> . . . . . .
>
> Why, then comes in the sweet o' the year."

"E molto bello: è il primo fiore della primavera," was the appreciative comment of an Italian labourer as he watched me digging up a wild yellow daffodil by the roadside outside Lucca. This fearlessness of our rough English spring—March is "the roaring moon of daffodils"—has made it pre-eminently an English flower, and the bands of Englishmen have fashioned it to its present beauty. Over two and a-half centuries ago Parkinson had anticipated Mr. Peter Barr in employing Pyrenean "root collectors," and describes some hundred kinds of daffodil. The magic art of cross-fertilisation was then undreamed of, and the possibilities latent in Parkinson's store awaited the coming of Herbert, first Dean of Manchester. Herbert, who, in one side of his versatile genius was something of a pre-Darwinian Darwin, published, in 1843, the results of many years' experiments at his Yorkshire rectory of Spofforth, and demonstrated that the short-crowned narcissi of the reputed "species" N. incomparabilis are really hybrids between the trumpet daffodils and the pheasant eye or N. poeticus. The first to avail themselves of this discovery, of such paramount importance for the enrichment of the spring garden, were Messrs. Leeds, of Longford Bridge, near Manchester, and Backhouse, of Walsingham By effecting this cross in variety, and intercrossing the resultant seedlings with other flowers and one another, they obtained the host of lovely forms now in common cultivation. These, again, are being sedulously used by the hybridist for the further evolution of size, form, and colour. The subsequent workers in the same field have all been Englishmen. A few fine trumpet daffodils have been raised in Holland, notably the very beautiful white Madame de Graaff by Messrs. de Graaff, of Leyden, but these seem to have been chance seedlings, and it is a curious fact that the Dutch, reputed quick to discern any avenue of profit, have never deliberately taken in hand the hybridisation of the narcissus. The best Polyanthus Narcissi or Tazzettas are, it is true, of Dutch origin, but these do not rank in general esteem or money value with other daffodils, and have scarcely been improved for a century. Leeds sold his entire collection for a hundred guineas, and the sum was thought so large that it was found by a small company of purchasers. Twenty times the amount would now be thought a small price. At the death of John Horsefield, the Lancashire weaver, who raised the fine white and gold trumpet daffodil bearing his name, the few bulbs were sold by auction for eighteenpence apiece—*sic vos non vobis*.

A propos of the essentially English associations of the daffodil, I have been told by Mons. H. L. de Vilmorin, of the great French firm of seedsmen and florists, that the venture of growing it on a large scale for the Paris market failed entirely. The more fanciful and fickle Parisian tires of a continuance of one flower, liking here a bit of white lilac, there a spray of mimosa or a bunch of Riviera anemones, but only now and then a daffodil. In France, too, there has never prevailed, as in England, what may be termed intensive gardening, the loving and exhaustive study of some one particular flower in all its phases and potentialities. The sight is inconceivable in France, which may be witnessed any April at a Royal Horticultural Society's gathering, of four men standing rapt and abstracted, their heads in close contact over a match-box containing a single "pip" or floweret of a new auricula seedling. The minutiæ of distinction between daffodils like "tweedledum and tweedledee" to the casual eye, their more subtle nuances of shape, tint, and growth, are for the specialist, the daffodil florist proper, and it is vain to reproach him for distinguishing between things indistinguishable. Wherever the mind's full interest is long bent upon a numerous class of objects, the critical faculty develops, and the eye, without either straining or make believe, acquires powers both telescopic and microscopic.

But there is no lack of more obvious charms in the daffodil. In its resources of form and colour there is a limitation, a certain restraint and sobriety, which belong to the highest beauty no less in nature than in art. It loses nothing when compared with the orchid's fuller colour-palette and bizarre eccentricity of form. In its general chalice or bell-like contour it presents but two elements, the inner crown, cup, or eye, and the outer whorl or perianth of six petals, or, more accurately, sepals. The crown may be a long tube or funnel, as in the trumpet daffodils, or a shallow eye defined by a rim not a quarter of an inch deep, as in the poeticus. But cross the trumpet and the poeticus, and again intercross parents and progeny, and the central portion of the flower exhibits every gradation in depth of cup, bowl, saucer, and plate, to draw a familiar comparison from the wholly inadequate resources of the modern crockery cupboard. An apter but over recondite illustration might be found in the more varied and graceful curves of the equivalent Greek and Roman vessels. The colour elements are only yellow, white, and red. The yellow—a cheerful and satisfying colour in flowers—is of large range, from the richest gold of the stately Maximus or Santa Maria, a still deeper toned flower discovered in Spain by Mr. Peter Barr, to the cream of Pallidus præcox, which consorts so exquisitely with the purple of violets or Iris reticulata. In one catalogue I find the yellows described as orange, lemon, primrose, canary, gold, sulphur, with light, full, rich, clear, soft, and a dozen other modifying adjectives. The daffodil's whitest white, almost the negation of colour, is found in the poeticus, especially the late P. recurvus. Elsewhere the whites are those of the ecclesiastical embroiderer, the faintest possible creams, greens, and, in the cups of some of the Leedsi class, citrons and pinks. When left to dress itself the daffodil employs red with quite niggardly discretion, as though to merely accentuate and set off its yellow and white. The purple brown thread which rings the eye of N. poeticus sometimes appears in its seedlings and hybrids as a ribbon-edge or a suffusion of red. By intercrossing such flowers an accumulation of the colour may result, and some of my own most recent seedlings have cups of almost true scarlet. This intensified red is held to be one of the goals of the hybridist and is greatly coveted, but I must own to private misgivings whether violence has not been done to the daffodil's better taste, and the lighter touches of colour are not more pleasing. Should a seedling ever attain to full red in both cup and petals, it would command an enormous price, but artistically considered would be somewhat of an outrage. The most disdainful of all daffodils in its rejection of red is the dainty little N. triandrus, with pale, clustered, cyclamen-like blossoms, as common in parts of Portugal as the primrose in Cornwall, but practically unknown in England until fifteen years ago. From this, crossed with the larger garden kinds, I have a series of perfectly lovely hybrids with pendant fuchsia-like flowers of the most refined cream and ivory whites. But cross it as you will with the most brilliant of the red-cupped sorts the seedlings perpetuate its own simpler apparel, and never show a trace of red.

A race more delightful to myself than perhaps any other are the Leedsi varieties, intermediate between N. poeticus and the white trumpets. It is remarkable that in this cross the former parent effaces the weakliness of the latter, and supplies a diversity of vigorous and very lovely white flowers. In the cups of some of these a quite exquisite range of colouring occurs, which can be only imperfectly conveyed by such words as salmon, citron, apricot. Recent seedlings perhaps foreshow the coming of true pink in the daffodil. To appreciate these delicate tints the flowers should be studied in the late afternoon when the sun is off them and they seem to create a still, magical atmosphere about themselves.

A discourse upon the whole art and mystery of seedling raising would far transgress the bounds of this paper, but it should be urged that the time is at hand when this department will be necessary to every gardener abreast of the times in the culture of flowers, fruit, or vegetables, to the least amateur and to the largest farmer. Seed selection and cross fertilisation are as certain to supersede, or at least supplement, the mere propagation of existing plants as the electric light is to extinguish gas. Absolutely nothing has been done in this province in comparison with what awaits the educated and industrious worker. A certain fortune, for instance, is in store for the young man who will devote his life to the scientific improvement of our fruits. In narcissi there are still many desiderata; large early yellow trumpets of sturdier constitution; finer and stronger white trumpets; short-crowned flowers, of the size and vigour of Sir Watkin, of uniform clear white, and others with cups of full red. The Polyanthus Narcissus is still capable of advancement in size and colour. I cannot join in the current depreciation of this beautiful plant; its earliness and perfection of growth in Cornwall should draw more attention to its possibilities. The poeticus may be enlarged and the eye deepened in colour.

My remark at the outset, that the Cornish daffodils ought to be unsurpassed, was not of the ungrateful nature of general faint praise, but referred to one point only. The *répertoire* of the market growers has struck me as rather meagre. The truth is questionable of the common objections that it does not pay to buy new varieties, and that the public do not distinguish between one kind and another. The wise grower will not invest largely in an untried bulb, however striking the flower may be at a show, but he will not neglect to have a small experimental bed of the newest introductions. It is strange that the bright yellow and red and the immense vigour of Barri conspicuus have not caused it to be more largely grown. That very fine golden trumpet, M. J. Berkeley, of the maximus order, but less shy in bloom, should well repay an enterprising buyer. The new bicolor, Victoria, is dear at present, but increases fast, and for size and substance will supersede Horsfieldi and Empress. More attention should be paid to the best Leedsi kinds, such as Minnie Hume and Duchess of Westminster. The spot or mildew which has lately invaded the former may be a transient effect of season. The Covent Garden salesmen tell me that good white narcissi, such as these, are wanted. It may be an excellent investment to give £5 or £10 for a bulb of a small new stock. An instance is known to me of £5 being paid for one Madame de Graaff, and at the end of three years three of its increase being sold for £12 and three still retained. A midland florist expresses to me his regret that he purchased only one bulb of Weardale Perfection on its first appearance at £12 12s. apiece.

On the subject of cultivation I am reluctant to say much. The dilemma besets me that upon the general requirements of a plant it is superfluous, and upon its local requirements presumptuous to speak. Let me not fall into the pit of the technical education lecturer on horticulture, who, in my country side of chalk downs, with the nearest water a hundred feet from the surface, devoted the whole of his introductory lecture to methods of drainage. Mr. Andrew Lawry was amiable enough to follow my suggestion and plant his ornatus deeper, but found he had made a mistake. That the following practices are beneficial I do not doubt. Early planting and early lifting; rotation of cropping, *i.e.*, not growing daffodils, or at least not similar kinds, upon the same plot for long together: an occasional entire change of stock with a distant grower, if feasible; manuring from the surface with soluble phosphate, such as dissolved bone. The much advertised basic slag is valueless on most, perhaps on all, Cornish soils.

REV. GEORGE ENGLEHEART, in *The Cornish Magazine.*

A Supposed Dahlia-Sunflower Hybrid has been forwarded to the Royal Horticultural Society for the second time this season by Mr. Lowe. The specimens were very much arrested in growth and malformed; but they would otherwise be regarded as dahlias. It may be observed that M. Martin Cahuzac attempted to cross the dahlia with the chrysanthemum; but in his case, as with Mr. Lowe, the supposed hybrid did not appear to be very marked.

EXHIBITIONS AND MEETINGS.

NATIONAL CHRYSANTHEMUM SOCIETY, December 6, 7, and 8.

ON this occasion there was held at the Royal Aquarium an exceptionally fine late show, and probably on no previous occasion has there been such a good December display. The competition throughout was good and the flowers first-rate; decorative exhibits were also good, and the non-competitive displays by Mr. Davis, Mr. H. J. Jones, and Messrs. H. Cannell and Sons were first rate.

CUT BLOOMS.

In the principal cut bloom class for two dozen Japanese varieties, in not less than eighteen varieties, Mr. T. Lunt, gardener to A. Stirling, Esq., Keir, Dunblane, N.B., followed up his previous great successes in the north by winning the first prize thus far south; his varieties were Simplicity, Australie, J. Seward, Mons. Hoste, Matthew Hodgson, Mons. Gruyer, Mrs. H. Weeks, Oceana, Mrs. F. A. Bevan, Niveus, Khama, Mdlle. M. A. de Galbert, Mary Molyneux, Graphic, Mrs. G. W. Palmer, Duchess of York, and Louise. There were six entries, Mr. R. Kenyon, gardener to A. F. Hills, Esq., Monkhams, Woodford Green, coming second; and Mr. W. Slogrove, gardener to Mrs. Crawford, Gatton Cottage, Reigate, third. Mr. Lunt was also the most successful competitor in the class for twelve distinct Japanese, staging Graphic, Mrs. H. Weeks, Edith Tabor, Simplicity, Khama, Niveus, Australie, Oceana, Matthew Hodgson, Mons. Gruyer, Madame P. Rivoire, and Louise; Mr. R. C. Notcutt, Broughton Nurseries, Ipswich, second; Mr. F. King, gardener to A. F. Perkins, Esq., Holmwood, Surrey, third; and Mr. R. Kenyon, fourth. There were no less than nine entries in this class.

There were eight competitors in the class for six Japanese blooms distinct, the first prize falling to Mr. J. Sandford, gardener to G. W. Wright Ingle, Esq., Woodhouse, Finchley, who showed excellent flowers of Silver King, G. J. Warren, C. W. Richardson, Madame Carnot, Simplicity, and Golden Gate; Mr. Lunt, second; and Mr. G. Elder, gardener to J. W. Benson, Esq., Walton-on-the-Hill, Epsom, third.

It must surely be a record to find eight stands of twelve incurved blooms at a December show, but that was the number of sets for which Mr. F. King secured the first prize with first-rate blooms of Mdlle. Lucie Faure, The Egyptian, Miss P. Fowler, C. B. Whitnall, Miss V. Foster, Bonnie Dundee (2), Lord Rosebery, L'Amethiste; Mr. F. G. Foster, Brockhampton Nursery, Havant, second; and Mr. R, Bassil, gardener to D. H. Evans, Esq., Pangbourne, third. A good and interesting class was that provided for two dozen bunches of chrysanthemums, three blooms per bunch, and here Mr. W. Howe, gardener to Sir H. Tate, Bart., Streatham Common, won first place with a good set, mostly of Japanese varieties; Mr. N. Davis, Framfield, second, showing pretty decorative varieties; Mr. S. G. Cook, Hendon, third.

The first prize for a dozen bunches of Japanese blooms, not less than six varieties, and three blooms per bunch, arranged in vases with long stems and foliage, was won by Mr. R. C. Notcutt, who had a good exhibit of Etoile de Lyon, Matthew Hodgson, Cheaberque, Mrs. Maling Grant, Lady Northcote, Julia Scaramanga, Madame Laurence Zede, Golden Gate, Silver King, Master I. H. Tucker, Niveus, and C. W. Richardson. For six bunches of Japanese blooms, three blooms per bunch, Mr. J. Hoath, gardener to A. W. Chapman, Esq., Farnham, won with bright and clean blooms of Mons. Panckoucke, M. Gruyer, Western King, Etoile de Lyon, Oceana, and Australie; Mr. G. Elder, second; and Mr. T. Robinson, third.

Mr. G. C. Farmer, Maidstone, won the prize for six Japanese blooms, amateurs; Mr. F. Durrant, Ware, second; and Mr. G. P. Clark, Hitchin, third. Other prize-winners were Mr. L. Gooch, Mr. W. Perrin, and Mr. H. Love. Mr. Perrin, gardener to C. W. Richardson Esq., Sawbridgeworth, won the chief award for a dozen Japanese blooms, his best flowers being Graphic, Madame Carnot, and G. J. Warren; Mr. H. Love, second; and Mr. Hooney, third Mr. T. Tullett, gardener to G. Alexander Esq., Brentwood, led for six bunches. of small flowered single varieties, Nellie Robinson and Miss Anderson being well shown; Mr. A. Page, North Finchley, second; and Mr. A. Felgate, third. For large flowered single varieties, six bunches, Mr. Felgate came to the front with fine flowers of Captain Felgate, Yellow Giant, Mrs. Felgate, Duchess Elizabeth, and Seedling No. 25; Mr. Tullett, second; and Mr. Meridew, Camberwell, third. Mr. G. W. Forbes, gardener to Madame Nicols, Surbiton, scored for a dozen bunches of large flowered single varieties, winning with big flowers of Turcola, Earlswood Glory, Admiral Sir T. Symonds, Yellow Giant, J. Arter, Miss Brown, Purity, Victoria, and Rudbeckia; Mr. A. Felgate came second and Mr. W. C. Pagram third.

PLANTS AND FLORAL DESIGNS.

Mr. A. Newell, gardener to Sir E. Saunders, Fairlawn, Wimbledon Common, staged the best table of plants, putting up a pretty arrangement of crotons, poinsettias, dracænas, palms, bouvardias, Roman hyacinths, Begonia Gloire de Lorraine, &c.; Mr. W. Howe, second, with a rather heavier arrangement. Mr. W. Orpwood, Uxbridge, was first for a table of cyclamen with handsome plants well flowered; the same competitor also led for primulas. An exceedingly pretty basket of berries and autumn foliage secured for Miss C. B. Cole, Feltham, the first prize in a class for the same; Mr. A. Newell was placed second, and Mrs. Newell third, Miss Easterbrook gaining an extra. Mr. W. C. Pagram led for a vase of chrysanthemums arranged with foliage, showing single varieties effectively; Mr. A. Page second, and Mr. A. Hooney, East Barnet, third. For one large vase of chrysanthemums, arranged with berries and foliage, Mr. D. B. Crane came first with a stand of yellow flowers; Mr. A. Taylor second, and Mr. E. Jones, Bedford, third.

NON COMPETITIVE EXHIBITS.

Considering the lateness of the present show, the grand exhibit put up by Mr. Norman Davis, Framfield Nurseries, Sussex, was very wonderful. He had magnificent bunches of Madame Carnot, G. J. Warren, Western King, King of the Plumes, &c., &c., staged in big vases; and some of the huge bunches contained as many as twelve or eighteen flowers of exhibition size. The examples of G. J. Warren and Madame Carnot, on boards, were splendid, so also were the single, decorative, and market varieties arranged in smaller vases and baskets. The whole produced a grand effect, together with small crotons, palms, ferns, &c. A large gold medal was awarded.

A magnificent exhibit of chrysanthemums was set up by Mr. H. J. Jones, Lewisham, who used his large Japanese vases for huge bunches of good bloom, one variety in each vase. There were also some pretty baskets of flowers, mostly of exhibition size, and representing a number of distinct varieties. Small plants and bunches of small flowers formed a groundwork for the big vases, while in front were thirteen stands, each containing a dozen good blooms of the best Japanese varieties, such as G. J. Warren, Matthew Hodgson, Western King, Duchess of York, Mr. A. Barrett, Iserette, Silver King, Joseph Chamberlain, M. Chenon de Leche, &c. Mr. H. J. Jones was deservedly awarded a gold medal. Mr. T. S. Ware sent a table of plants and cut flowers. Mr. R. Owen, Maidenhead, had a charming display of chrysanthemums, arranging them in large vases and on boards. A large table was occupied by this display. Miss Cole, Feltham, sent a basket of large-berried and well-finished Muscat of Alexandria grapes. A silver gilt medal was awarded. Mr. A. Felgate, jun , Hersham, Surrey, showed a fine late crimson chrysanthemum named Red L. Canning, staging cut blooms and plants.

Messrs. H. Cannell and Sons, Swanley, had a most brilliant display of chrysanthemums and pelargoniums, the latter in large bunches and in splendid condition, their bright colours lighting up the place finely. Begonia Gloire de Lorraine was effectively staged, as also were the bunches of Miss Harvey—a plumed chrysanthemum—Golden Dart, Mrs. Filkins, Alice Carter, and Neva Teichmann. The whole display was tastefully finished with palms and ferns; a gold medal was awarded for this extensive display from the Home for Flowers.

WOOLTON GARDENERS' IMPROVEMENT SOCIETY.

THE usual meeting was held in the Mechanics' Institute on the 1st inst., Mr. J. Glover in the chair.

That the subject, "Japanese Chrysanthemums for Exhibition," was a popular one was fully demonstrated by the very large attendance; the interest was further increased by the lecturer being Mr. J. Heaton, of Aigburth, the winner of the two silver challenge vases offered by the Liverpool Horticultural Association and the Grassendale Society.

The paper throughout showed observant cultural details, the cuttings to be put in during November to January. Care at this stage as to watering was recommended; in fact, this was the strong point through the whole period, more importance being attached to this detail than any other. Placing the pots on the ground was strongly objected to, standing the pots on the edges of two boards or on trellis being the system adopted, and this form was continued even after housing, and finer results were obtained with plants on stages than those placed on the floor. Moderate feeding from an early stage was desirable, both natural and artificial manures being utilised up to the time of cutting the blooms. Notice was made of insect pests, with the best methods for their extermination, but means for prevention were strongly advised. At the conclusion a very instructive tabulated list was given of some 50 varieties, including the time of striking, the time of stopping (in the varieties this was done), which bud was taken, and the date it was secured.

The paper was followed by an interesting discussion, in which Messrs. W. Tunnington, R. Todd, T. Carling, G. Haigh, R. G. Waterman, J. Hogan, J. Wilson, and others took part, in which questions were asked and the opinion expressed that the paper was complete in every detail, and must prove of service.

In addition to the paper a highly meritorious collection of blooms were staged by Messrs. J. Heaton, G. Haigh, T. Carling, J. Wilson, and Messrs. W. Clibran and Son. The members contributed some fine massive blooms, including Japanese—Sunstone, Western King, C. W. Richardson, Mary Molyneux, Mast. H. Tucker, Geo. Pitcher, Lady Northcote, &c.; incurves, Duchess of Fife, Mdlle. Lucie Faure, Bonnie Dundee, Miss Phyllis Fowler, Sir Trevor Lawrence, &c. Messrs. Clibran staged new varieties of Japanese and singles, the latter being much admired as being suitable for house decoration. This fine display was the means of raising a discussion as to having an exhibition in the locality, and was referred to the committee.

ROYAL OXFORDSHIRE HORTICULTURAL SOCIETY.

THE sixty-ninth annual general meeting of members was held at the New Municipal Buildings, Oxford, on December 3. Twenty odd members were present, the chair being taken by Mr. Aubrey Harcourt, Nuneham Park. The annual report (which, with a duly audited statement of accounts, had been circulated among the members) referred to the past year's operations as a success, financially and floriculturally. The very effective groups of carnations, tuberous begonias, and those arranged for effect on a given space, with the displays of cut roses and dinner table decorations at the June show, were regarded as fully sustaining the high quality of the Oxford summer exhibitions, while the lovely array of dahlias and herbaceous flowers with the fruit and vegetables at the August show proved a surprise for a dry summer. As is wont, death had removed a large number of old supporters during the year, and great regret was expressed at the loss of Mr. E. Thorne, the vice-chairman of the committee, and one of the most successful amateur exhibitors in the district. The accounts showed that the receipts for the past twelve months had been £409 18s., and the payments (including £214 14s. 6d. as prizes) amounted to £394 8s., the society's reserve fund standing at £91 5s. 4d.

The following were elected officers for 1899, viz.: President, Aubrey Harcourt, Esq., Nuneham Park; treasurer, Herbert Parsons, Esq., Elsfield Manor; honorary secretaries, John Thomson, Esq., Woodperry House, and Montague Wootten, Esq., Cross Ways; acting secretary, Mr, William Greenaway; auditor, W. S. Carver, Esq.; and a strong committee. The commemoration flower show will be held on June 20 next.

PRESTON AND FULWOOD HORTICULTURAL SOCIETY.

THE eighty-seventh monthly meeting of the above was held on the 3rd inst., at Preston, Mr. B. Ashton presiding over a fair attendance.

The subject under consideration was "Soils and their Treatment," by Mr. R. G. Waterman, treasurer and secretary of the Woolton Society.

The paper was of a practical nature, showing the utmost importance of this section of the cultivator's work, and was considered under the following heads: Position, shelter, draining, trenching, burning, manuring, rotation of crops, &c. The needs of keeping the work well in hand and by intelligent feeding were amongst the more important roads to success. Some few questions were put to the lecturer as to the value of lime, gas lime, soot, salt, &c.

At the conclusion of the paper, on the motion of Mr. Parkinson, seconded by Mr. Parker, a cordial vote of thanks was tendered to Mr. Waterman for his admirable paper. A similar vote was given to Mr. Ashton for his services.

ISLE OF WIGHT HORTICULTURAL ASSOCIATION.

THE monthly meeting of the Isle of Wight Horticultural Improvement Association was held at Newport on Saturday last. Dr. J. Groves, B.A., J.P., presided over a very large gathering of members from all parts of the island, who were present to hear a lecture by Mr. T. Gibbs, C.C., on "Birds." The lecture was most copiously illustrated by lantern slides of the best known birds. The lecturer gave a most interesting and instructive discourse, and showed the utility of birds, and their indispensable value to gardeners. The subsequent discussion proved most profitable, the gardeners present expressing their views on the various birds with which they had come in contact. An unanimous vote of thanks was accorded the lecturer and others on the proposition of the chairman, and seconded by Mr. R. F. Eldridge, J.P., C.A., vice-chairman of the Isle of Wight County Council, and chairman of the Technical Education Committee. Several new members were elected at the close.

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, &c., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning change of dates.

Hyacinth scented Cattleya.—M. R. W., Burnham: Some forms of Cattleya labiata are delicately but not highly fragrant, so that if you have a variety of the autumn-flowering form of this species, with flowers strongly perfumed with the scent of hyacinths, it is somewhat of a novelty, and should be taken care of.

Celery for Profit.—J. H. E., Edmonton: The book to which you refer is published by W. Atlee Burpee and Co., Philadelphia, U.S.A., and can be obtained direct from them. The best plan would be to obtain it through some good publishing house, such as G. Putnam's Sons, 24, Bedford Street, Strand, W.C., who are an American firm. You will probably have to pay a little extra for duty.

Vine Border.—R. E. T., Milborne: The sample of soil sent was very poor stuff, and you had better replace it with a more congenial rooting medium. If good loam is not readily obtained, or is very expensive, we suggest that the border be renovated piecemeal, as advised for several correspondents of late. Make the drainage material good and clean; over this lay some good turves, and then proceed to make up the border, laying out the roots near the surface, and in a horizontal manner. Lime rubble, burned garden refuse, and wood ashes are very useful for mixing with the new material, and the latter should be placed near the surface.

Seedling Oaks in Orange Skins.—G. W., Leeds: In the first place obtain a large and thick-skinned orange, cut off the top, and thoroughly remove all the flesh, so as to leave as large a shell as possible. Then place the orange shell or skin where it will dry steadily—hanging it in the kitchen will do. When thoroughly dry and hard it will be ready for use; into it place some damp—not wet—soil with an acorn in the centre. Place the whole in a position where the soil will not dry quickly, as no quantity of water should be needed until the young oak has made a number of roots. It is not necessary to place the affair in the dark, but if this is done at first, light must be afforded directly growth appears above the soil.

Wooden Labels.—A. C., Worcester: The making of large wooden labels is work that can be profitably undertaken during the winter when the inclemency of the weather necessitates the provision of some tasks under cover. With a little practice labels can be made out of an ordinary builder's lath, of the double size or thickness, and cut into required lengths. Smooth the sides with as little waste as possible, and shave off smoothly about six or eight inches of the best front face with a sharp knife. Finish the lower end by cutting the sides to a short, sharp, wedge-like point. Procure a few pounds of pitch or tar, boil it, and dip into the boiling tar the lower end of the label to the required depth. Allow the tar to dry, and then spread over the untarred surface a thin coat of well-mixed paint. Lay the labels by in a dry place until required, and before using the smooth surface should have a second coat of paint, which must be written upon before it becomes quite dry. Write legibly, commencing at the top corner, so that the most important part of the name does not become obliterated.

Winter Dressing for Mealy Bug on Vines.—C. W., Southampton: Curiously enough the same post that brought your query brought an answer to it in the shape of a recipe from an East Anglian correspondent. He writes: "I do not remember ever having seen in print the recipe we use for curing and preventing attacks of mealy bug on vines. It is a winter dressing, recommended to me by a large market grower, and is composed of one gallon of water, one wineglassful of petroleum (paraffin), half-a-pint of coal tar, and sufficient clay to work the whole into the consistency of paint. We have just finished dressing our vines with this mixture for the third season in succession, and during the operation we could not discover a single mealy bug. For eleven years previous we tried various mixtures and means for clearing out the pest, but none proved wholly good, though several kept the insects in abeyance. The only fault we have to find with the tar mixture is that the young vine shoots appear to be rather more brittle than usual after the rods have been dressed with it; this matter is, of course, met by a little more care when tying down the growths."

Hyde Park.—L. J. P., Derby: We do not exactly understand what kind of information you desire with respect to this park for the paper you intend writing, but probably the following will meet your case. Hyde Park is the great Park of London, a wide expanse of land, consisting of 394 acres. It was first opened to the public in the reign of Charles I., about the year 1630, having previously been a royal hunting ground. The first ranger was George Roper, and the office is still maintained. In 1730 Queen Caroline, the Consort of George II., first conceived the idea of the famous Serpentine water, by converting the Westbourne Brook into a more imposing stream. This elaborate work was entrusted to Mr. Charles Withers, Surveyor-General of His Majesty's Woods and Forests, and 200 men were employed in the undertaking. It was finished in the year 1733. Hyde Park is for the most part what may be called meadow land, but a valuable "lung" of London, and the resort of fashion. Rotten Row, the famous ride, is a feature of interest. The bedding is finely executed under the direction of Mr W. Brown. Hyde Park is under the Crown, not the London County Council. If you need concise information respecting other London parks we reccommend to you the forthcoming issue of the Gardening Year Book, price 1s., published at the GARDENERS' MAGAZINE office, 4, Ave Maria Lane, E.C.

NEW PLANTS AND FLOWERS.

CHRYSANTHEMUMS.

Madame R. Cadbury, a first-rate Japanese variety, of large and full build, and with prettily drooping, but broad, florets of a beautiful soft-white shade that is almost creamy white, but exceptionally pure and pleasing. F.C., N.C.S., December 6. Mr. H. Weeks, Thrumpton Hall Gardens.

Red L. Canning, a useful decorative variety, with bright, red-crimson flowers that are naturally produced late in the season. F.C.C., N.C.S., December 6. Mr, A. Felgate, jun., Surbiton.

MARKETS.

Covent Garden.

SUPPLIES of fruits and vegetables are an average as regards quantity, and the quality is fair. There is a brisk demand generally, but especially for apples, grapes, tomatos, and Brussels sprouts. Cut flowers are plentiful, and though prices tend to rise they are not high for the season.

FRUIT.—English apples, 3s. 6d. to 10s. per bushel; Nova Scotian and Canadian, 10s. to 24s. per barrel; English grapes, 9d. to 2s.; Channel Islands, 6d. to 1s. per lb.; Almeria, 12s. to 20s. per barrel; bananas, 4s. to 9s. per bunch; pineapples, 1s. 6d. to 4s. 6d. each; Jaffa oranges, 8s. to 10s. per box; Murcia, 6s. to 7s.; Valencia, 8s. to 16s. per case; English tomatos, 5s. to 7s. per 12 lb.; Bordeaux, 1s. 3d. to 2s. 3d. per box; lemons, 10s. to 18s. per case; French pears, 3s. to 5s. 6d.; Californian, 4s. 6d. to 7s. 6d. per case.

FLOWERS.—Arums, 3s. to 4s.; carnations, 1s. to 3s.; chrysanthemums, white and yellow, 1s. to 3s.; eucharis, 2s. to 4s.; gardenias, 1s. to 2s. 6d.; Lilium Harrisi, 5s. to 8s.; tea roses, 6d. to 1s.; pink roses, 3s. to 4s.; red roses, 1s. to 2s.; cattleyas, 5s. to 9s.; Odontoglossum crispum, 2s. to 4s.; and tuberoses, 3d. to 9d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; chrysanthemums, 6s. to 9s.; marguerites, 2s. to 4s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 4s. to 6s. per dozen bunches; stephanotis, 1s. to 1s. 6d.; lily of the valley, 1s. to 2s.; Roman hyacinths, 1s. to 1s. 6d.; pelargoniums, 4d. to 6d. per dozen sprays; and bouvardias, 4d. to 6d. per bunch.

VEGETABLES.—English onions, 5s. to 6s. per cwt.; Dutch, 3s. 3d. to 3s. 9d.; Valencia, 5s. 6d. to 6s. 6d. per case; parsley, 1s. 6d. to 2s. per dozen bunches; seakale, 9d. to 1s. per punnet; endive, 1s. to 1s. 6d.; lettuce, 9d. to 1s.; cos, 2s. to 3s.; cucumbers, 2s. to 4s. per dozen; cauliflowers, 6s. to 9s; cabbages, 3s. to 5s.; savoys, 4s. to 6s. 6d. per tally; spinach, 2s. per bushel; Brussels sprouts, 2s. to 2s. 6d. per half-sieve; celery, 6s. to 12s. per dozen rolls.

Borough Potato Market.

Large supplies from Scotland have tended to lower prices a little; the demand is good, however. Scottish Abundance, Bruce, and Main Crop, 65s. to 70s.; Beauty of Hebron, Snowdrop, and Up to Date, 70s. to 75s.; White Hebron, Early Puritan, Bruce Magnum, Sutton's Early Regent, Reading Giant, and Imperator, 60s. to 65s.; Blacklands, 60s. per ton; Germans, 2s. 9d. per bag.

THE WEATHER DURING THE WEEK ENDING DECEMBER 3, 1898.

The mean reading of the Barometer during the week at Greenwich was 29·48 inches, and that of the Thermometer 44°·1, the latter being 3°·2 above the week's average in the 50 years 1841—90. The direction of the wind was variable, the horizontal movement of the air being 27 per cent. above the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 5·6 hours. The measured rainfall amounted to 0·26 of an inch.

application.

GEORGE GARSIDE, Jun., F.R.H.S., LEIGHTON BUZZARD, BEDS.

First Announcement after a Series of Highly Successful Experiments.

A MOST VALUABLE DISCOVERY

OF SUPREME IMPORTANCE TO GARDENERS AND AGRICULTURISTS.

EFFECTUAL DESTRUCTION OF EVERY FORM OF FUNGOID DISEASE,

Including Mildew, Sleeping, Drooping or Flagging, Disease in Tomatoes, Chrysanthemum Rust, Potato Disease, Club, etc., combined with the most potent fertilization.

Tomatoes,
Chrysanthemums,
Vines,
Cucumbers, Melons, etc.,
Fruit Trees,
Cereals and Grasses,
Potatoes,

ARE SUBJECT TO FUNGOID DISEASES.

☞ **To find a Cure for these Fungoid Diseases has baffled the Skill of Practical Men for years.**

THE CURE IS NOW FOUND!

and its discovery has crowned all previous scientific researches into the cause and remedy of FUNGOID DISEASES, for each and all of which we claim this new substance to be a certain and absolute cure.

Arresting the spread of disease in food-producing plants, and at the same time increasing their yield or crop, is a subject of vital interest and demands

MOST SERIOUS CONSIDERATION FROM EVERYONE.

This New Substance has a dual power—DESTROYING DISEASE GERMS OR SPORES, AND AT THE SAME TIME FERTILIZING PLANT LIFE.

RECENT NUMEROUS EXPERIMENTS PROVE that the yield or crop is INCREASED FROM 20 to 25 PER CENT. where it is applied. As an instance, the yield of potatoes is about 2½ tons per acre more where it is used, the tubers also are of better quality, being *entirely free from disease.* These advantages are secured at a cost of about 19/- per acre. Similar results are effected upon most of the food-producing plants.

The value of this combined power of Destruction and Fertilization is of immense importance, and cannot be over-estimated.

☞ SPECIAL CARRIAGE PAID PRICES IN THE UNITED KINGDOM—
Per cwt., 25/-. Half cwt., 13/-. Quarter cwt., 7/-. 14 lbs., 5/-. 7 lbs., 3/-.
A Reduction in lots of One Ton and upwards.

This highly concentrated compound should be mixed with from 8 to 10 times its bulk of dry sand, ashes, or road drift, and be applied in the following proportions:—¾ cwt. per acre; ½ lb. per rod (30¼ square yards); ¼ oz. per square yard (superficial).

EXAMPLE FOR A CUCUMBER OR TOMATO HOUSE.	EACH SIDE.	TWO SIDES.
90 feet long, each bed 3 feet wide, would require	½ lb.	1 lb.
90 " " " " 4½ " " " "	¾ lb.	1½ lb.
135 " " " " 3 " " " "	¾ lb.	1½ lb.
135 " " " " 4½ " " " "	1 lb. 2 oz.	2¼ lb.

GREENHOUSE PATHS and WALKS should always be dressed with the Compound, as it is there that spores frequently hibernate.

EXAMPLE FOR TOP DRESSING SOIL IN POTS:—
48 six inch pots, 35 seven inch pots, 27 eight inch pots, 21 nine inch pots, or 17 ten inch pots are approximately equal to one square yard, and would therefore require ¼ oz. of the compound.

Send for Prospectus containing full information, which will be Ready December 15th.

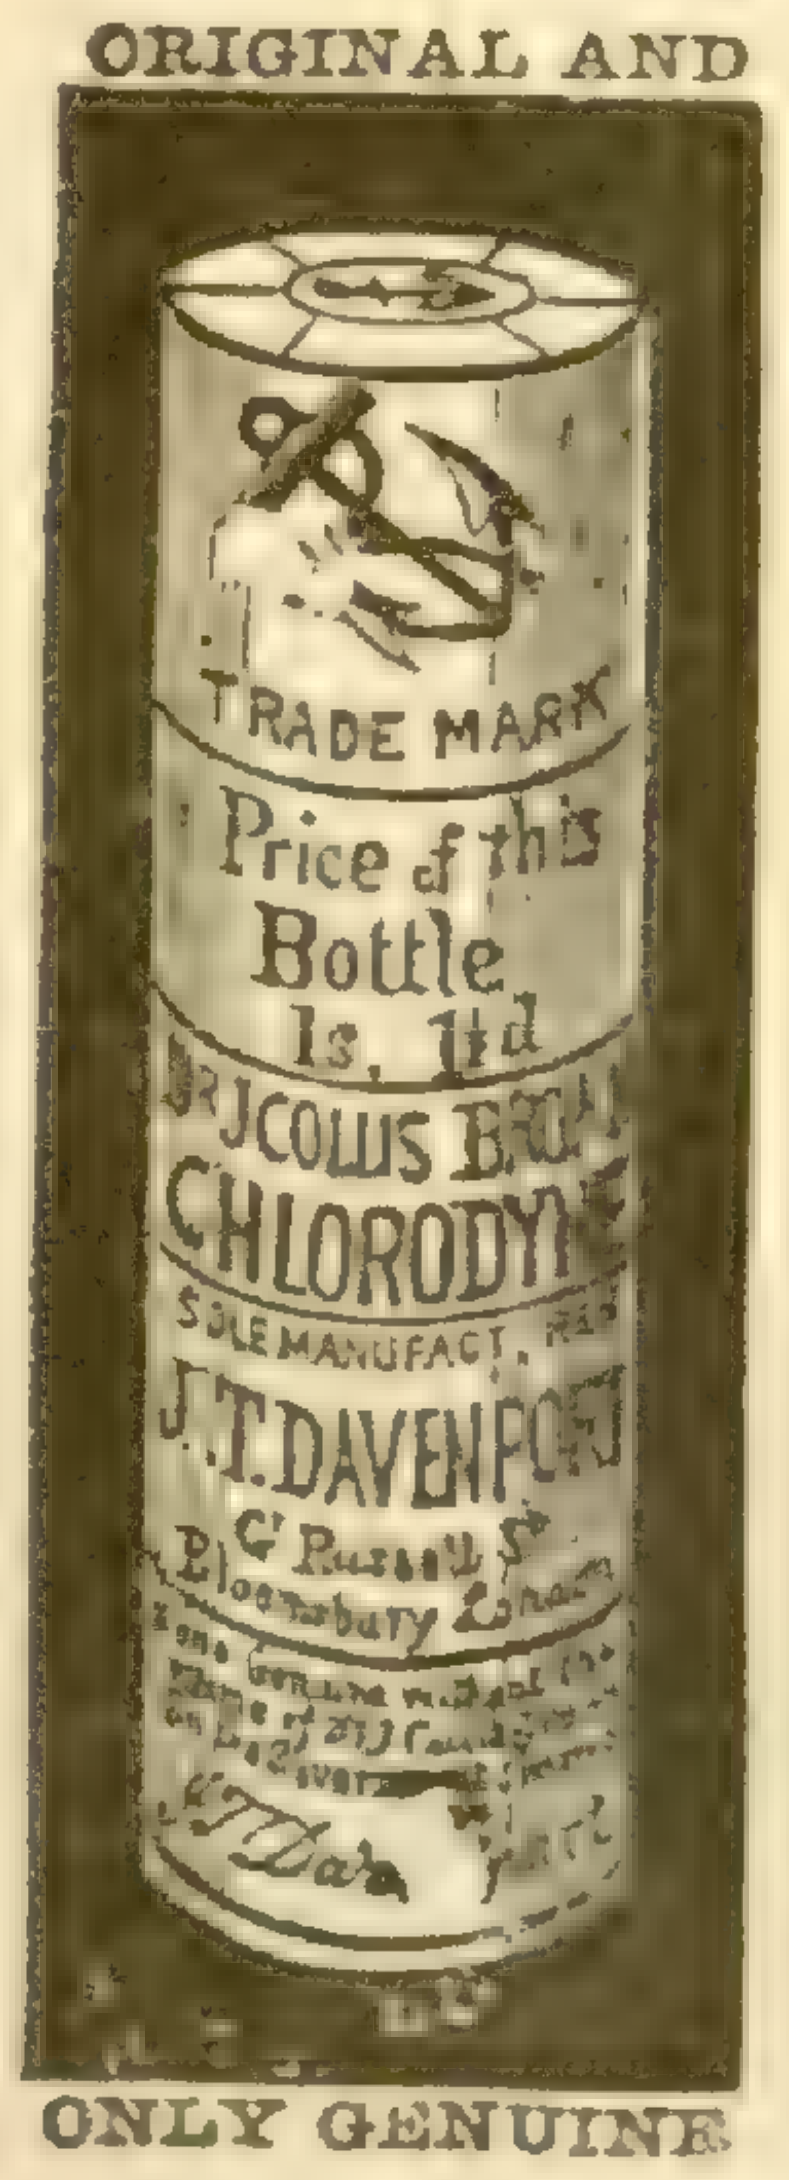
DR. J. COLLIS BROWNE'S

ORIGINAL AND



ONLY GENUINE

ORIGINAL AND ONLY GENUINE. CHLORODYNE.

COUGHS,

COLDS,

ASTHMA,

BRONCHITIS.

DR. J. COLLIS BROWNE'S CHLORODYNE.—Dr. J. C. BROWNE (late Army Medical Staff) DISCOVERED a REMEDY, to denote which he coined the word CHLORODYNE. Dr. Browne is the SOLE INVENTOR, and, as the composition of Chlorodyne cannot possibly be discovered by Analysis (organic substances defying elimination), and since the formula has never been published, it is evident that any statement to the effect that a compound is identical with Dr. Browne's Chlorodyne *must be false.*

This Caution is necessary, as many persons deceive purchasers by false representations.

DR. J. COLLIS BROWNE'S CHLORODYNE.—Vice-Chancellor Sir W. PAGE WOOD stated publicly in Court that Dr. J. COLLIS BROWNE was UNDOUBTEDLY the INVENTOR of CHLORODYNE, and that the whole story of the Defendant, Freeman, was deliberately untrue, and he regretted to say it had been sworn to.—See the *Times*, July 13th, 1864.

GREAT SPECIFIC for

CHOLERA,

DYSENTERY,

DIARRHŒA.

GENERAL BOARD of HEALTH, London, REPORT that it ACTS as a CHARM, one dose generally sufficient.

Dr. GIBBON, Army Medical Staff, Calcutta, states: "TWO DOSES COMPLETELY CURED ME of DIARRHŒA."

Royal Irish Fusiliers, Cork,
February 6th, 1896.

DEAR SIR,

I wish to give public testimony to the infinite value which your remedy for Dysentery and Diarrhœa (Dr. Browne's Chlorodyne) proved to several members of the Special Service Corps in the recent Ashanti Expedition. I bought a small bottle just before leaving London for West Africa, and, having used it myself with beneficial result, treated some of my comrades with equal success (though some of them were very bad). I should be very glad to recommend it to anyone about to travel in a treacherous climate, where they are so much exposed to this dangerous malady.

Gratefully yours,
G. SMITH,
"Band," R.I.F.

THE ILLUSTRATED LONDON NEWS of September 28th, 1895, says:—

"If I were asked which single medicine I should prefer to take abroad with me, as likely to be most generally useful, to the exclusion of all others, I should say CHLORODYNE. I never travel without it, and its general applicability to the relief of a large number of simple ailments forms its best recommendation."

DR. J. COLLIS BROWNE'S CHLORODYNE is the TRUE PALLIATIVE in

NEURALGIA, GOUT, CANCER,

TOOTHACHE, RHEUMATISM.

DR. J. COLLIS BROWNE'S CHLORODYNE is a Liquid Medicine which assuages PAIN of EVERY KIND, affords a calm, refreshing sleep WITHOUT HEADACHE, and INVIGORATES the nervous system when exhausted.

DR. J. COLLIS BROWNE'S CHLORODYNE rapidly cuts short all attacks of

EPILEPSY, SPASMS, COLIC,

PALPITATION, HYSTERIA.

IMPORTANT CAUTION.

The IMMENSE SALE of this REMEDY has given rise to many UNSCRUPULOUS IMITATIONS. Be careful to observe Trade Mark.

Of all Chemists, 1s. 1½d., 2s. 9d., and 4s. 6d.

Of Interest to Horticulturists.

S. C. CLAY'S INVIGORATOR
TRADE MARK.

'A Babbled of Green Fields.—(*Henry V.*, ACT ii., Sc. 3.)

For Grass is always green and brilliant when **CLAY'S MANURES** are used.

Why wither not the Leaves that want their sap?

(*Richard III.*, ACT ii., Sc. 2.)

Because **CLAY'S MANURES** are lasting and generous to the soil—enriching, not exhausting it, and vitalising every plant within reach to the utmost leaf.

This is the Flower that smiles on everyone.

(*Love's Labour Lost*, ACT v., Sc. 2.)

As indeed all flowers do that are cultivated by the aid of **CLAY'S SUCCESSFUL GARDENING,** whereby gardening readers win success—and first prizes.

The Purchase made, the Fruits are to ensue.

(*Othello*, ACT ii., Sc. 3.)

This is as apt as any, as many thousands of Gardeners can testify, for

CLAY'S MANURES

ARE UNSURPASSED FOR ALL HORTICULTURAL PURPOSES.

WISBECH.

ORCHIDS.—Clean, healthy plants at low prices. Always worth a visit of inspection. Kindly send for Catalogue. Choice Dendrobes a speciality.

JAMES CYPHER, Exotic Nurseries, Cheltenham.

NEW CHRYSANTHEMUMS.

Raised and Introduced by W. J. GODFREY.

REGINALD GODFREY.—Of the crimson-chestnut coloured this will take the lead. Nothing so bright and effective in this class. An easy grower and capital habit. (F.C.C., N.C.S.)

QUEEN OF THE EXE.—White, but pure and glistening. Bloom large, deep, and of fine form.

MRS. E. C. QUICK.—Very distinct; canary yellow, edge of petals slightly lined rose. Good form.

CHARLES WILSON.—Deep wine-red colour; large and full bloom.

NEW DECORATIVE VARIETIES.

MRS. E. VERE FREEMAN, ETTIE MITCHELL, and GOLDEN GLOW.

NEW INCURVED.

LORD COLERIDGE, and MAJOR MATTHEW (F.C.C., N.C.S., and A.M., R.H.S.)

AMERICAN NOVELTIES.

The following are selected from many dozens, and are offered as the finest introductions of recent years:—

YELLOW MOGUL.—One of the largest Chrysanthemums ever sent out. Florets very broad, which incurve and whirl into a magnificent bloom. The colour is distinct, being old gold, shaded and striped crimson-bronze: "a whopper."

AUTUMN GLORY.—Has been exhibited many times this season, and generally admired. A large bloom, of a lovely and soft salmon-pink, shaded peach. Distinct from all others.

ELMA.—Bright golden-yellow; in form similar to Mutual Friend. One of the best for grouping.

SILVER WEDDING.—Undoubtedly this is a variety which is come to stay. Has taken all the premier prizes in America, as the best introduction of the season.

Prizes for these splendid Novelties will be offered at the most important Exhibitions of next season, including The National, Birmingham, Belfast, Edinburgh, Dublin, Bristol, Hull, Manchester, Plymouth, and other Societies.

Full particulars (with reliable descriptions of the best varieties) in Catalogue, which is sent post free on receipt of post card.

W. J. GODFREY, Exmouth, DEVON.

CATALOGUES ON APPLICATION.

Situations Wanted.

Advertisements under this heading are charged 1s. each, four lines (32 words), and 3d. per line after. A Copy of the "Gardeners' Magazine," Post Free, 2½d.

THREE INSERTIONS FOR THE PRICE OF TWO!

GARDENER (Head); age 30; A. Jefferies, King's Walden Bury, Hitchin, Herts, is open for an engagement, where no less than five are employed. Experience gained in large establishments. Thoroughly trustworthy.

GARDENER (Head Working), where two or more are kept; thoroughly competent in all branches; excellent references; eighteen years in last place.—R. WOTTON, 14, Cynthia Road, Oldfield Park, Bath.

GARDENER (Head Working).—George Astridge, age 31, for the past three years gardener to H.I.M. the Empress Eugénie, SEEKS RE-ENGAGEMENT with a lady or gentleman requiring the services of a good, all-round practical gardener; life experience; excellent references; no family.—G. ASTRIDGE, Farnborough Hill House, Farnborough, Hants.

GARDENER (Head Working).—Age 24; married when suited; experienced in all branches.—Apply E. MAY, The Gardens, Hillingdon House, Uxbridge.

GARDENER (Single - handed); steady, active, industrious; age 26; four years' character from last situation.—W. GRUBB, 6, Waterloo Terrace, Newent, Gloucestershire.

JOURNEYMAN (First).—Young Man, age 23, over 8½ years' experience, strong and healthy, seeks situation as above.—R. ANDERSON, Canwell, Tamworth, Staffs.

JOURNEYMAN (Second); age 22; Inside and Out; used to fire duties; 10 years' experience; good character; please state wages.—C. C., West Barnes, New Malden.

RICHARD SMITH and CO., beg to announce that they are constantly receiving application from Gardeners seeking Situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

WANTED SITUATION as Single-handed working Gardener. Eleven years' experience with glass and kitchen garden; married; no family; two years' good character in present situation.—ARTHUR MORGAN, 47, Graveney Road, Lower Tooting.

YOUNG MAN (age 23) REQUIRES SITUATION as Second Gardener where three or four are kept; seven years' experience Indoors and Out. Highly recommended by present and previous employers.—F. E. NICHOLLS, Glen Lyn Lodge, Lynmouth.

IMPORTANT NOTICE.

AN EMPLOYMENT REGISTRY DEPARTMENT IS CONDUCTED IN CONNEXION WITH THE "GARDENERS' MAGAZINE," AND THE CHARGE FOR AN ADVERTISEMENT ***INCLUDES A FREE ENTRY ON THE REGISTER FOR ONE MONTH.*** IF NOT SUITED AT THE END OF THAT TIME, AND IT IS DESIRED THAT A NAME SHOULD REMAIN, IT WILL BE CONTINUED FOR A FURTHER PERIOD UPON RECEIPT OF A REQUEST. IMMEDIATE NOTICE MUST BE GIVEN WHEN AN ENGAGEMENT IS SECURED.

A List of Gardeners on the Register will be supplied upon application to the Publishers if a stamped envelope is forwarded, addressed 148 and 149, Aldersgate Street, London, E.C.

DERSINGHAM, NORFOLK.

PUBLIC IMPORTANT NOTICE.

AT p. 411 of the "Gardeners' Chronicle," last week, under National Chrysanthemums, a very grave error appears (see my reply, p. 426, in last week's issue), and as this matter has appeared in that Journal, I would like to ask the "Public Opinion" upon the matter, of which my Catalogue is a sore contention, viz., Gaining Gold Medals with other people's Flowers and Plants. Is it right? Mr. R. Dean, Secretary to the N.C.S., writes me, there is no restriction to miscellaneous exhibitors. They may get their stuff from anywhere they please; the Medals are not awarded to the exhibitors, but to the exhibits. This letter is now in the hands of Mr. T. W. Saunders, Chairman of the N.C.S. Mr. Dean also refused to bring my letters before the committee; hence the notes in my Catalogue, which will be sent free to anyone upon application. And I ask again, How much longer are the N.C.S. going to encourage trade-exhibitors to beg, buy, or borrow blooms and foliage plants, and give them their Gold Medals, in order that they may advertise "Awarded so many Gold Medals"? Is this the kind of honours Englishmen are so proud of? And how about Scotchmen?

Speaking of honours, where do my last two seasons' Novelties stand, as an exhibitor's point of view, viz., G. J. Warren, Lady Hanham, Julia Scaramanga, Lady Isobel (incurved), Nellie Pockett, John Pockett, Mrs. J. W. Barkes, Mrs. White Popham, Mr. T. Carrington, &c.? Are these any honour? Nellie Pockett has been awarded 22 First-Class Certificates or Awards of Merit; John Pockett has been awarded 20 First-class Certificates or Awards of Merit. Also the Gold Medal in Paris for "Novelties."

And how will my Novelties of 1899 stand, viz.:—

HON. W. F. D. SMITH, grandest crimson	10s. 6d.
LORD LUDLOW, another Australian Beauty ...	7s. 6d.
MR. LOUIS REMY, the grand yellow sport from Madame Louis Remy	7s. 6d.
LADY ANGLESEY, pure yellow sport from Chas. Davis	7s. 6d.

And other best Novelties, which appear in my Special List, now ready. Post free from

W. WELLS,

EARLSWOOD NURSERIES, REDHILL, SURREY.

THE CHRYSANTHEMUM-RUST.

The above facts

SPEAK FOR THEMSELVES,

and are better than volumes of brag and bombast, and prove the superiority of the

RYECROFT RESTED STOCK,

which, though grown so near London, is healthier than country grown stock, and up to the present time has NOT been attacked with the Rust. Thousands who have visited my Nursery and Growers of my Stock can testify to the truth of this.

WORTH POUNDS.

My CHRYSANTHEMUM CATALOGUE is not a catalogue in the ordinary sense, as it contains much valuable information, including a Special Article on Stopping and Timing nearly 600 varieties; this will be invaluable

TO EVERY EXHIBITOR,

and will be sent post free for one stamp.

A New Edition of my CHRYSANTHEMUM GUIDE is in course of preparation, which will reach one hundred thousand with this issue; it will contain, as before, articles from the pens of the most successful Cultivators of the Chrysanthemum. This will be ready early in the New Year, and will be sent post free for seven stamps, or 1s. 2d. bound in cloth.

I have much pleasure in announcing that I have arranged with Mr. W. Seward (the well-known raiser of many of our best Chrysanthemums) to introduce his magnificent varieties for '99. These are the best he has ever raised, and include what has long been wanted—some Grand Novelties in several shades of red, from terra cotta to the richest crimson. Mrs. W. Seward (a crimson scarlet), Chenon de Leche, H. J. Jones (the grandest and richest real crimson), and Mrs. Henry J. Jones (the giant incurved) are part of the set.

In addition my own Novelties include R. Hooper Pearson (the grandest yellow Jap), Lili Boutroy (large petalled white), Lord Aldenham (yellow sport from Edwin Molyneux), H. Rivers Langton (yellow sport from Mrs. W. H. Lees), Madame Leon Feyerick (yellow sport from Eva Knowles), Mr. J. T. Simpson (sport from Julia Scaramanza), Eastman Bell (crimson sport from President Borel), Mr. A. Barrett (sport from Mrs. C. H. Payne), Mr. A. H. Hall (a giant bronze seedling from Edith Tabor), Mr. A. G. Miller (a giant silvery pink), and May Manser (the new large early flowering white Jap), and several others. The full list will be ready shortly, and will be sent post free on application.

NEW CHRYSANTHEMUMS.

EXTRAORDINARY SUCCESS.

NEVER in the annals of Chrysanthemum History has such phenomenal success been achieved by any raiser of New Seedlings as by Mr. H. WEEKS, in the sensational productions exhibited by him from time to time this season before the Floral Committee.

When it is remembered that in the small collection of a private garden only a very limited number of plants can be grown of each variety, and the difficulty therefore of securing the required number of blooms stipulated for by the N.C. Society on a given day, it is indeed remarkable that no less than Eight First-class Certificates should be awarded. Other varieties equally as good had to forego their candidature from the simple fact that only two flowers could be ready at the same time, or else the total number of Certificates would have been larger. This is indeed success. I have the honour to announce that I have secured the entire stock of all these magnificent Novelties, and shall distribute same together with a few of my own, and some of the finest Australian Seedlings ever introduced.

NEW CATALOGUE NOW READY, POST FREE.

Lots 382 to 392. 3 ft. Movable Wire Runs. Usual Price, 4s. each extra. Sale Price, 2s. each.

Lot 469. 12 B.S.A. pattern Cycles. Best material and workmanship. Dunlop Tyres. Usual Price, £12. Sale Price, £7. With cheaper pneumatic tyres, £6 each.

Keynes, Williams, and Co.,

ESTABLISHED OVER 150 YEARS.

THE NURSERIES, SALISBURY.

SPECIALITIES.

LORD PENZANCE'S SWEET BRIARS. We were entrusted with the propagation and first distribution of these lovely hybrids. All desiring the true stock should obtain them direct from us.

Price 1s. 6d, each.

ROSES - - - Upwards of 120,000 grown every year. The special feature about the SALISBURY ROSES is that the soil naturally tends to the production of an abundance of fibrous roots, ensuring safe removal anywhere. SALISBURY ROSES often thrive where those raised in heavier, richer soils fail.

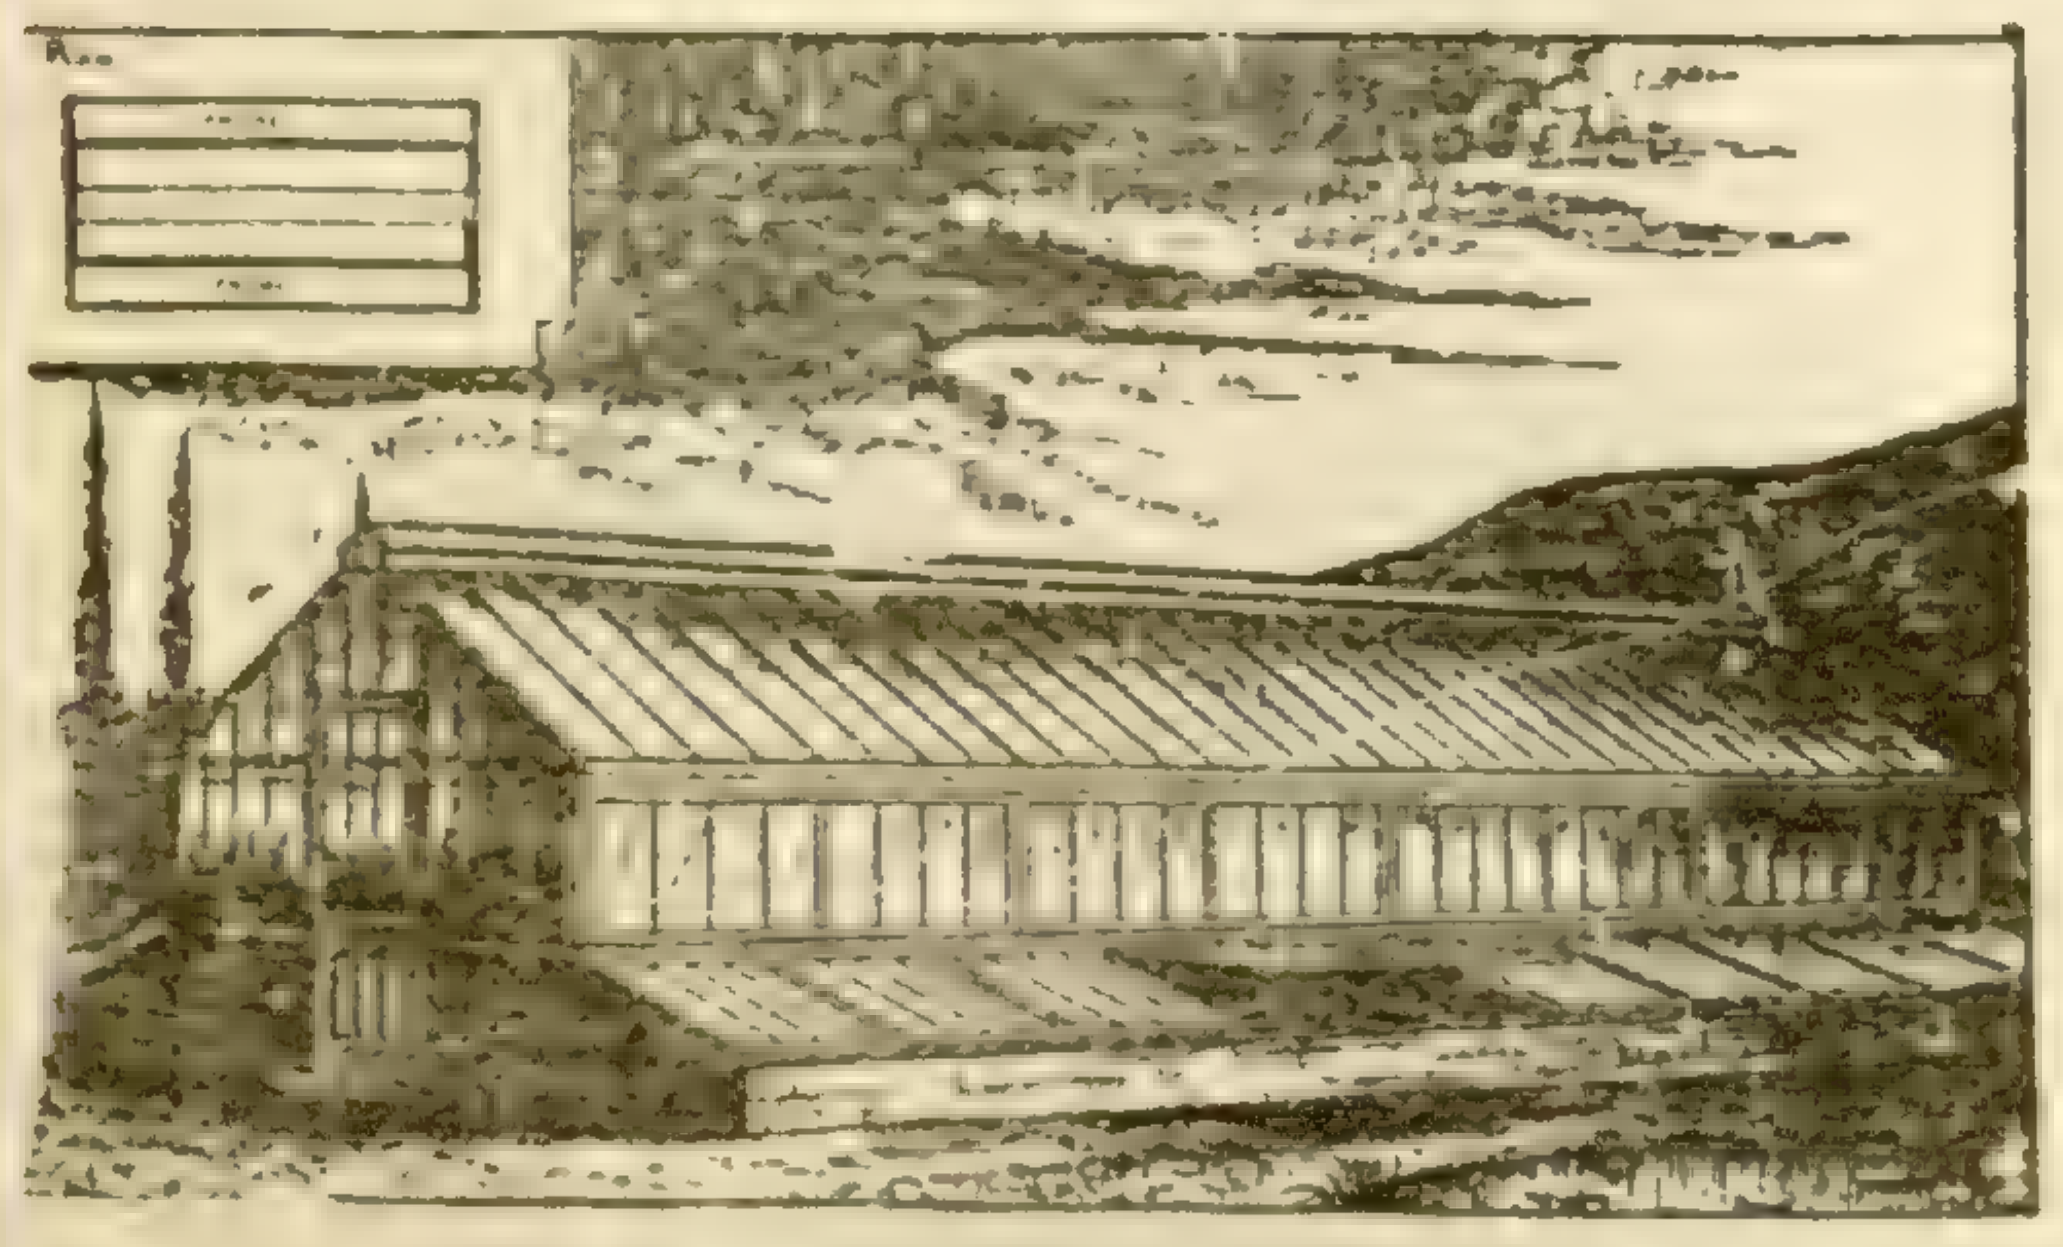
DAHLIAS - - - More than half the good varieties now in commerce were raised here. The greatest care taken to send out no plants but such as are true to name and true to character. Thousands of pot roots now ready; those prepared for export may be safely sent to any part of the world.

GRAPE VINES - - For forty years these have been a great speciality. The stock is clean and perfectly free from disease, true to name, and in every way reliable.

CATALOGUES GLADLY SENT TO ALL APPLICANTS.

KEYNES, WILLIAMS and CO., Nurserymen, &c., SALISBURY.

FOSTER & PEARSON, Ltd.



SPAN HOUSE WITH FRAMES.

From E. L. CAVE, Esq, Solicitor, Bromyard.

"The Houses that your firm supplied nearly **30 YEARS AGO** *are still good and sound."*

OUR HOUSE WILL STAND THE TEST OF TIME.

From Sir HENRY EDWARDES, Wootton Hall, Ashbourne.

"The Vinery you erected for me at Wootton Hall is the same in every respect as when it left your factory **25 YEARS AGO."**

ESTIMATES ON APPLICATION
— FOR —
RANGES, VINERIES, &c.,

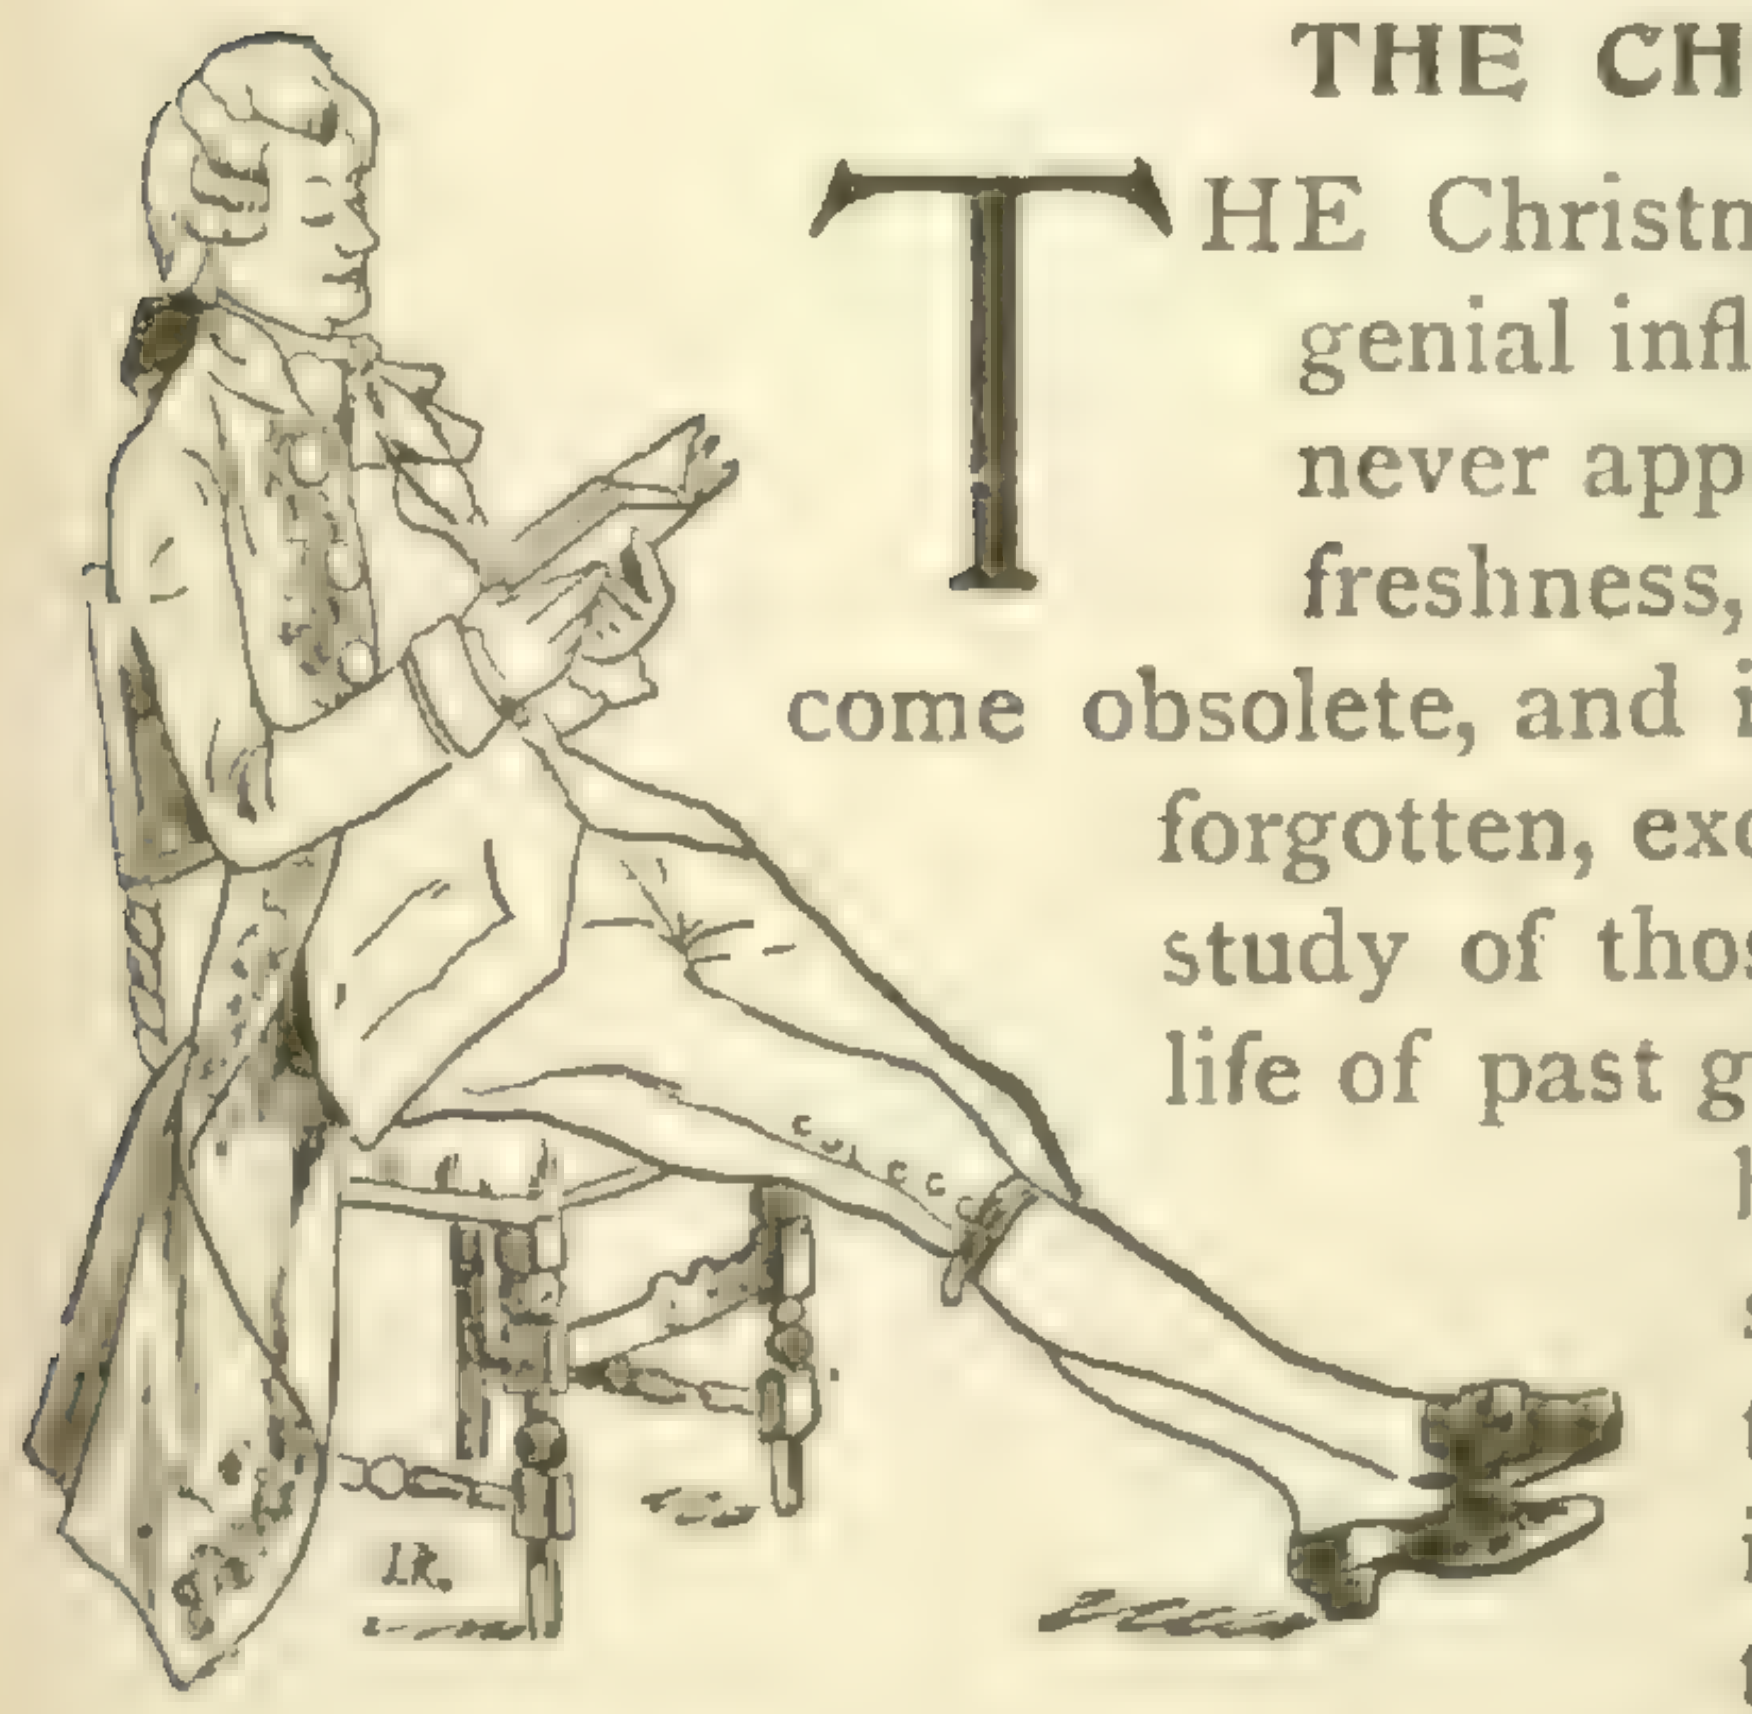
AN ALMANACK FOR 1899
Printed in Colours and representing the
PENZANCE HYBRID SWEET-BRIERS
Is presented with this Number.
Subscribers should see that their Newsagents deliver this Supplement with each copy.

NOTES OF THE WEEK.

THE CHRISTMAS SEASON.



THE Christmas season that now spreads its genial influence upon all classes of society never appears to lack a certain degree of freshness, although many festivals have become obsolete, and in some instances are well-nigh forgotten, except by those who delight in the study of those things which entered into the life of past generations. Young and old alike breathe the spirit of this blessed season, blessed for the opportunities it affords for friendly gatherings, generous contributions to the needs of those in want of help, and kindly thoughts for others. An inquiry into the cause or causes of the remarkable freshness that characterises the celebration of this happy season would unquestionably yield much that is of interest. This investigation would probably reveal the fact that it is not alone due to the religious element, or to the social aspect of the season, but is in great part the result of their combined influence. It would also probably be found that the climate has exercised a material influence in the maintenance of a keen interest in all that belongs to Christmas, for while the festival has occupied an important position in English, German, and Scandinavian customs, its observance is materially lessened as we proceed southward. We, however, do not advise that our readers should engage in the solution of difficult problems at this season, but rather would suggest they regard the Christmas festival as in its nature a necessity of our being, and altogether beneficial. It is satisfactory to observe that the relation of Christmas to horticulture, which in the distant past was extremely slender, is rapidly becoming closer, and as the result the products of the orchard and garden play an increasingly important part in the festivities associated with the Christmas season. The shrubbery is resorted to for the holly with its glistening berries, and the orchard is searched for supplies of mistletoe, which by old and young is regarded as an essential part of the greenery employed in the decoration of the home, while flowers in great variety are lavishly employed by those who are in a position to indulge their taste in this direction. Having regard to the increasing demand for the various products of the garden, it is satisfactory that the supplies of all the more important are abundant and obtainable at reasonable rates. In some instances prices are rather too low from the grower's point of view, but while we sympathise with those who are unable to obtain an adequate return from any particular crop, we derive satisfaction from the knowledge that the section of the community with but moderate means have within their reach the choicest fruits and flowers grown for commercial purposes, and that all but the very poorest are able to obtain a plentiful supply of wholesome fruits and vegetables. Let us hope that the wants of the latter will not be overlooked, and that now, as in the past, those who are in a position to do so will remember that portion of the community who from their own resources are unable to participate in the good things that abound on all sides, and thereby act in accordance with the spirit of the Christmas season.

MISTLETOE.

THE mistletoe is curious in being the only truly parasitical plant, native to this country, of which any decorative use is made, the comparatively few others, such as the broomrape and dodder, being neither conspicuous nor ornamental, while there are few things more beautiful than a well-developed bunch of mistletoe pendulous from its host tree, and thickly bedecked with its lovely pearl-like berries. Examining it carefully we find its entire structure to be curiously distinct from that of plants of independent habit, its peculiar jointed character, and the dull olive green of its blunt ovate leaves set on in pairs, together with its pendulous habit of growth and peculiar mode of branching, all distinguish it most markedly from the foliage among which and at whose expense it grows and flourishes. Its mode of establishment is also very remarkable. Here we have a plant absolutely incapable of taking its nourishment direct from the soil by its own roots, so that were its seeds to fall to the ground when ripe, as with ordinary plants, there would be an end of them. On the other hand, when they by chance lodge in a cleft of the tree, there lies between them and the necessary sap of their host a thick and seemingly impenetrable layer of bark. Any ordinary seed, under such circumstances, would push out a root, and, finding no sustenance, would die off straightway, but the mistletoe is a crafty and insidious plant, and starts by developing and inserting a series of claws, which grip the bark and slowly pierce it, long before it attempts to form anything in the shape of leaves. It thus concentrates all its energies upon tapping the vital forces of the tree, and having in time fixed its tentacles within the circulatory system, it then leisurely proceeds to profit by what it can draw therefrom, and with it fashions its pendulous bush, and eventually its pearly freight in addition. Those little pearls, too, are marvels of adaptation to needs. Therein lies the seed, embedded in a tenacious, sticky medium, so that a bird, making a meal of a number of them, is bound to cleanse its beak by rubbing it on the branches, and almost equally bound now and again to fix an adherent seed in a suitable place for its subsequent development, while, by way of revenge for those actually devoured, the plant supplies the birdcatcher with his birdlime. Finally, in return for its life of parasitism and treachery to its feathered friends, by some strange irony of Fate its pearly branches are selected at this joyous season as a symbol of innocent freedom among coy maids and bashful youths, and snatched from the leafy glade to deck the festal hall. Its moral obliquity as a plant is entirely condoned for the sake of its beauty and the traditions of the past which cling to it.

◆ ◆ ◆

FLORAL EVOLUTION.

IN these days of advanced scientific floriculture, based upon a far deeper knowledge of the laws of reproduction than obtained even when this century was well advanced, floral evolution is seen to be split into two distinct branches, one literally as old as the hills, and the other altogether of recent development. The one form of evolution has been the outcome of the general struggle for existence which has been going on between all forms of life for countless ages, and when we regard the infinite types of beauty, in form, tint, and detail, which have resulted from the intricate relations of hostile and friendly factors in the environment of plants, we cannot fail to be struck with a far greater wonder and admiration than is evoked by the other branch of evolution referred to, marvellous as that is seen to be. That branch, embracing the selective power of man, has grown with his intellectual development, and precisely as that, in these enlightened days of ours, has suddenly burst forth into the full bloom of the Victorian era, so the art and science of horticulture has advanced by leaps and bounds to keep pace with the spread of knowledge and the extension of every facility afforded thereby. In the old days the brilliant flora of the exotic world was known to the travelled only, and the roaming botanist was handicapped in a thousand ways. Enormous areas of the land were sealed books, impenetrable save at their borders, and, so far as the plant lover was concerned, the most he could do was to collect seed and trust to Providence for the rest, since slow-going sailing vessels and ignorance of the Wardian case precluded almost entirely the transport of tender living plants. Should such, by extraordinarily good fortune, reach the grower here, once again he was handicapped by hot, stuffy flues and the general insanitary conditions of the ancient hothouses. Steam revolutionised floriculture in every way, it shortened the perilous voyage, bit by bit it opened up the hitherto impenetrable areas rich with new species of plants, and finally, when these were safely to hand, steam in its incipient stage of hot water afforded the strangers literally a warm and cordial reception on their arrival, and made them feel as much at home in this wayward climate as in their native habitats. Then selective evolution leapt onward with gigantic strides; all the world contributed its material as fashioned by the bee and other tribes on the one side, and the adaptive tissues of the flower on the other, plus that omnipresent and invisible factor which actuates them all, and which no amount of argument can eliminate. This material, beautiful or curious, its sexual and specific relations studied and grasped, was then seen to be as plastic as clay in the potter's hands, and underlying all was that potent factor aforesaid aiding the cultivator in a thousand ways by variations, large and small, some of which could be accumulated into floral wonders of size, while others started off in new directions altogether to swell the crowd of distinct types. By selective culture, which means evolution, fostered and directed by man's particular tastes, a grower can modify a breed of plants in his lifetime as much as Nature would do in millions of years; but there is ever this difference in the result: Nature knows how to maintain her own creatures without man's aid, but man's floral handiwork is entirely dependent upon his continued protection, and left in the hands of Nature would speedily be restored to their pristine shape, and shorn of any exuberance due to human fancy only.

Our Illustrations.—The illustrations accompanying Mr. George Nicholson's article on "A Land of Flowers and Sunshine" are reproduced from photographs taken by Henry Little, Esq., of Baronshalt, St. Margaret's, who has been not less successful with the camera than with orchids, and the other classes of plants to which he has devoted his attention. Mr. Little has during the past few years taken some thousands of photographs in various parts of Europe, and he has given practical effect to his recreation by converting a thousand or so of his negatives into lantern slides, and exhibiting them on behalf of the local charities. Already Mr. Little has been able to hand over to the hospitals and other charitable institutions in Richmond and Twickenham between £500 and £600. The illustrations of the topiary art at Levens Hall are from photographs by Mr. J. Hogg, of Kendal; and of the examples in the gardens of Elvaston Castle Gardens from photographs by Mr. W. Winter, of Derby. The wintry scenes in the gardens of Chiswick House are from photographs by Mr. C. Henwood, of Chiswick; and the illustrations of the Kew Museums are from photographs by Mr. J. Gregory, Croydon.

Mr. W. Botting Hemsley, F.R.S., F.L.S., is known throughout the scientific world as an able botanist, and the Principal Assistant at the Herbarium, Royal Gardens, Kew. Mr. Hemsley, besides being a clever gentleman, is an extremely amiable one, as all who have had the pleasure of his company can testify. We refer to Mr. Hemsley now to congratulate him upon the dedication to himself of the hundred and twenty-fourth volume of the *Botanical Magazine* by its editor, Sir Joseph Hooker, C.B., F.R.S., &c. Sir Joseph Hooker's dedication is worth quoting: "My Dear Hemsley,—I have three reasons, each sufficient, for offering to you the dedication of a volume of the *Botanical Magazine*; firstly, as a record of the interest you have shown in this work, and an acknowledgment of the valuable aid I have received from you in conducting it; secondly, the amount and importance of your labours in Systematic and Geographical Botany, as especially evidenced in your great works on the Flora of Central America and on the Botany of the *Challenger* Expedition; and lastly, my wish that you should accept this dedication as the tribute of a friend to a collaborator for upwards of thirty years in the Herbarium of the Royal Gardens.—Believe me, with esteem and regards, faithfully yours, J. D. Hooker." Sir Joseph could have offered at least another reason for his dedication, viz., that Mr. Hemsley's rise from the ranks to his present high position, by his own efforts, was deserving of such recognition. Mr. Hemsley entered Kew as a "young gardener" in 1860, and gained a Civil Service appointment at the Herbarium in 1865; in 1867 he left Kew owing to a complete breakdown of his health, but returned after about seven years' absence, and since then has continued to rise until he now occupies a position at the top of the botanical ladder.

Chrysanthemum Fixtures, 1899.—In addition to the fixtures of interest to those engaged in the cultivation of chrysanthemums that have been already announced in these pages the following arrangements have been made. The National Chrysanthemum Society will hold its exhibitions on October 10, 11, and 12, November 7, 8, and 9, and December 5, 6, and 7. The meetings of the Floral Committee have been arranged for September 27, October 10 and 25, November 1, 15, and 22, and December 5, and the hour of the meetings has been fixed for half-past one p.m. As in former years, the exhibitions and meetings will be held at the Royal Aquarium, Westminster. The Leeds Paxton Society will hold its exhibition of chrysanthemums November 14 and 15. Messrs. E. Beckett, G. Gordon, V.M.H., E. Molyneux, V.M.H., and J. Wright, V.M.H., have been appointed judges at the Hull Chrysanthemum Show, November 15 and 16. The York Society of Ancient Florists will hold its chrysanthemum show November 15, 16, and 17.

Proposed Opening of Finsbury Circus.—There is, Mrs. I. M. Holmes informs us, a movement now on foot for throwing open the garden of Finsbury Circus to the public, and the scheme is deserving of widespread support. This garden has an ancient and interesting history, for it is a portion of the original Moorfields, a remnant of that division, known as the Lower Moorfield, which was nearest to the City boundary. The Moorfields or Finsbury-fields are described as the chief recreation-ground for the citizens of London by Fitzstephen, Stow, and other early chroniclers, and the Moor-gate led from the City into this common or playground. Although parts of the "great fen or moor" were from time to time enclosed, the palings were always pulled down by the citizens, who thus established and maintained their rights in the land. Aggas's plan of 1560 shows the plot now occupied by Finsbury Circus as an open field, where the inhabitants of London are spreading out their clothes to dry, practising with bows and arrows, and carrying water from the wells, while the cattle peacefully eat the grass. The only building is the "dogge house"—the kennels of the City hounds. But two centuries later, when houses had been built to the north, east, and west of the Moorfields, the open space still remained intact. In 1638 Charles I. granted the Moorfields to the Mayor and citizens of London, the charter expressly stating that no person should have permission from the Crown to erect any new building upon the Inner Moor or the Outer Moor or West Smithfield, "but that the said separate fields and places be reserved, disposed, and continued to suchlike common and public uses as the same heretofore and now are used, disposed, and converted to." And these common fields existed as such until 1786. In 1773 Noorthouck wrote: "What are called the lower quarters of Moorfields, which lie along the front of Bethlehem Hospital . . . are defined by broad gravel walks, planted with trees on each side, and being railed round and covered with grass they form agreeable ranges for the neighbouring inhabitants to walk in. That particularly which crosses the middle, parallel with the hospital, is distinguished by the name of the City Mall." The centre of this City Mall or public promenade, which in Rocque's plan (published in 1746) is shown as an avenue, exactly corresponded with the centre of Finsbury Circus. The ancient and extensive Moorfields and Finsbury-fields are now represented by four limited enclosures, the Honourable Artillery Company's ground, Bunhill Fields Burial Ground, Finsbury Square, and Finsbury Circus; and if the last-named of these spaces is restored to the public we shall only be giving back to the people of London a small portion of the open land which London ought never to have yielded up. The Metropolitan Public Gardens Association will support the scheme as far as is in its power.

The Preservation of the Wagtails.—The Board of Agriculture, in its efforts to protect useful birds, has issued a pamphlet giving illustrations of the pretty water-wagtails and reasons why they should be preserved. Gilbert White states that "wagtails run round cattle, availing themselves of the flies that settle on their legs, and probably finding worms and larvæ roused by the trampling of their feet." This bird is also seen near ponds, streams, and rivers, and in marshes and flooded meadows, taking the insects found there. If pied wagtails are watched it will be seen that they are never still, but are continually hunting for insects of all descriptions—beetles, flies, moths, and aphides, as well as millipedes, snails, and slugs. The pied wagtails migrate from the more northern to the southern parts of the kingdom in the autumn, and some leave this country for the winter. Flocks of them have been noticed in Kent and Sussex near the coast in September, evidently bound for foreign climes. These return again very early in the spring, but there are always pied wagtails to be seen throughout the winter in this country, except in the more northern regions. The grey wagtail is not so common as the pied species. It is found in more solitary places, in the mountainous districts of England and Scotland. It likewise is the good servant of the tiller of the soil. The yellow wagtail is not a winter bird, but appears in this country in the month of March, and leaves in the autumn. There is no doubt that this wagtail, like its congeners, devours the snail hosts of the liver fluke. All the wagtail family (dishwashers) are found near watercourses and marshy places.

Success of the Scottish Horticultural Association.—We have to congratulate this enterprising association upon the great success of its splendid chrysanthemum show held at the Waverley Market last month. On the first day £393 were taken; second day, £346; third day, £348; total, £1,087. The total income from all sources amounted to £1,301. The total expenditure, £1,092, included £233 for music, £430 for prizes, £34 for printing, £57 for advertising, £90 for fitting up the market, &c., leaving a balance of £209. We are glad to see that the association, which gave £250 to charities in 1897, is continuing its good work by distributing £100 this season as follows: Gardeners' Orphan Fund, £15; Gardeners' Royal Benevolent Institution, £15; the Infirmary, £15; Hospital for Children, £15; Society for Prevention of Cruelty to Children, £20; and £10 each to two sick members of the association who formerly rendered valuable aid to the association. Well done, "Auld Reekie."

The Botanical Magazine for the present month contains illustrations and descriptions of Musa Bakeri, a new species from Cochin China; Cardamine latifolia, a Pyrenean plant resembling a gigantic form of the common C. pratensis; Paphiopedilum (Cypripedium) Mastersianum, a fine Javanese orchid now fairly plentiful in this country; Caladenia carnea var. alba, a terrestrial and Australian orchid of slender growth; and Fritillaria pluriflora, a very handsome but rare fritillary from Northern California; its flowers open widely, and are of a rich reddish-rose hue.

A CHRISTMAS MIXTURE.

"I HAVE put you down," writes our Editor, "for a Christmas Mixture. Do the best you can. You have not prepared one for some years." Why, no. Now I think of it, the young people held the field last year, and we old fogies had to retire into the background. By a little bit of topsy-turveydom, only possible at Christmas time, the young men in a certain garden were given authority, and the chief and his local cronies had to do the subordinate work. This season we are given another turn. The editorial *communiqué* goes on: "I shall be glad of the copy at your earliest convenience, and I mention this because of the difficulty of obtaining copy up to time from some writers, even with a fair amount of badgering." Here, straight away, is a text for me. Numbers of young writers long for enshrinement in type, but never get it. Older hands have the opening placed before them, and yet have to be prodded before they take advantage of it. We hear every day about the difficulty of young writers to get their wares accepted, and editors are stigmatised as cold-blooded tyrants, rejoicing in the opportunities which they have of lacerating tender flesh. It is nonsense, every bit of it.

If the young gardeners in this country were half wide awake they would see that there are unexampled opportunities before them for Press work. I do not believe there is a single horticultural editor who would not gladly welcome new blood on his staff, provided it was of the right quality. As Blackwood said regarding George Eliot's maiden effort, there is "place and pay" waiting. Young writers do not make progress because their work is not good enough. Its brevity is baldness, its length is labour. Editors like brevity, but not baldness. They will sometimes tolerate length, but never labour. I am not going to quote names or make direct references, but I will say this—If anyone were asked to count the really capable writers on the various gardening papers he would surely be able to do it on the fingers of his hands. Yet think of the miles of columns which have to be filled every year. This is not well. I am aware that ideal gardening literature is difficult to produce. It must have practical interest, professional accuracy, freshness of idea, brightness of style, and perfect lucidity. But it could be produced if only writers would study manfully enough, and keep always before them the factors which go to make up the perfect article.

But, dear, dear! Here am I being led away into fault-finding at Christmas time, when it is so much more seasonable to be shaking hands with each other, and telling each other what jolly good fellows are we. We'll throw criticism, like physic, to the dogs. Far away sounds the voice of Peter, raised in decorous revelry. The notes are not, perhaps, musical; indeed, they bear a suspicious resemblance to the hooters of the steam tugs on the Thames, but what they lack in melody they make up in vigour. Peter is happy. He has "company," and I believe they are celebrating an argumentative triumph which their host has won. I listen, and this is the ear-haunting pæan of victory which resounds:—

THE SONG OF THE ONION.

Peter—Down beyond the 'tatur rows, up against the peas,
Not so very distant from the sprouts;
(Easy there, the chorus; steady, if you please;
When you see my signal start your shouts).
We trenched a bit o' loam, lads, made it pretty deep,
Carted on the dung and dug it in,
(The master wanted chemicals, but you can bet your heap
I argufied it quickly out of him).

Chorus—If you want some 'taturs, if you want some kale,
If you want some onions, big and sound,
Drop along at Christmas (Lux will stand the ale),
Peter is the boy to bring 'em round.

Peter—A coat beneath the second spit, a coat beneath the third
(Some poor creeturs' satisfied with one),
Every bit o' subsoil broken up and stirred,
Trenching here I tell you isn't fun.
On the top some wood ash, then a bit o' soot,
That's the way we start to make the bed,
Afterwards there's firming, I does it with my foot,
Though others gets a heavy lump o' lead.

Chorus—If you want some 'taturs, &c., &c.

Peter—When it comes to sowing I take a box o' mould
—A fortnight after Christmas is the time—
(Although some young beginners, leastways so I'm told,
Sows their seed six months ahead o' mine).
Plant 'em out in April, watching for the grub
(Paraffin's the stuff to make it ill),
Get some farmyard liquor ready in a tub,
And give it to the onions with a will.

Chorus—If you want some 'taturs, &c., &c.

I am doubtful whether the reader wants any more of this. If I thought he did I would keep on. So far I have counted thirteen verses, and Peter is still singing lustily. After all, a little music makes a change. From time to time preternaturally wise young men complain that the course of study does not run smooth in the bothy, because the chrysanthemum hand, who is clever with the flute, has invited in the cowman, who excels with the violin, and these two are reinforced by the man from the orchids, whose forte is the manipulation of a lugubrious tin whistle. Of course sympathy ought to be with the wise young man. Is he not striving to improve himself? Has he not read a paper stuffed with research (stuffed so full that nothing could be got out of it) before the members of the Claybury Gardeners' Mutual Improvement Association? Yes, these things are true. Nevertheless, if I might, at this festive season, be allowed to whisper a word in his ear, I would say, "Don't make sawdust of knowledge. Keep it fresh and sweet and attractive. If, once in a way, there comes temptation to fling books aside and keep time with the cowman's fiddle, do not shrink from it in horror, but let Nature have her head, and go back to work again when it is all over freshened and invigorated."

I once knew a young gardener who was the solemnest of all solemn prigs. That, it may be suggested, is saying a good deal, since prigs are pretty numerous in horticultural circles; nevertheless, I stick to it. He was a walking encyclopædia of gardening knowledge. He was armed at all points. It was a sight to see him when question time came after one of his numerous papers had been read. The sleek, sedate air said as plainly as possible, "roll them out, gentlemen, I am ready." He was, I say, armed at all points—all save one. There proved to be a weak point in his armour. It was not a horticultural one; indeed, it was nothing more nor less than love. Let me digress for a moment to ask if you ever saw a gardener in love? His is no common passion. It approaches the sublime. One phase of it is a predilection for making edible presents—his master's choicest peaches, for instance. Peter was once in love, and he stopped short at nothing, not even at onions. With a wild and reckless generosity he gave away half the contents of my garden. Fruit, flowers, and vegetables alike went, and I was not sorry when the affair died a natural death in the lady's elopement with a joiner. Our young gardener "read his paper"—*i.e.*, made his proposal—but when it came to question time he was utterly and irretrievably silenced by a decided "No." She preferred the first journeyman (his own junior!) because he was "nicer." Alas!

I wonder if anyone is so foolish as to consider the foregoing as an attack upon study. Perhaps they do, because, as Lord Herschell remarked in his great speech on Anglo-American unity a few weeks ago, stupid persons crop up everywhere, and no country has a monopoly of them. If I were not so desperately determined to eliminate anything which might be construed as unkind from this Mixture I might advance the fact, and give proof of it, that there are a few rather silly persons in gardening circles. However, I shall hope to be better understood by the majority. I believe in study when it is natural, spontaneous, and wholesome, but not when it is stilted and unhealthy. Mental alertness and suppleness form a better equipment than solidity of the stodgy order. If I could only command the rhyming facility of Peter I should be able to express my meaning in verse, but,—ah! my worthy henchman's chant of triumph has ended at last, and it is succeeded by something very different, carolled out in a sweet tenor voice which makes every word sound clear:—

Sing, love, of summer flowers,
For they are sweet;
Swift is the rush of hours
Here at your feet.
Day and its labour past,
Rest soothes us all at last,
Life's tide is flowing fast;
Yes, time is fleet.

Shall I, in its small span,
Stifle my soul?
Silence the glad élan
Which makes it whole?
Nature, with tender sigh,
Spreads out her robes, and I
Draw in devotion nigh,
Glad of her dole.

Empty the life of man,
Arid the heart,
Who from her wondrous plan
Ever shall part.
Tell me the tale anew,
Clarion the story true;
I, if my days be few,
Early must start.

Teach me the lesson, then,
Knowledge I crave;
Work is the lot of men
This side the grave.
But they with rev'rent eyes,
Gazing on fields and skies,
Slowly must learn to rise,
Who pain would save.

Sweet your voice, O singer; searching your philosophy. You tell us in those pure, rich notes, which come floating over the garden at this peaceful Christmastide, the story which Wordsworth told:—

> "To the solid ground of Nature
> Trusts the mind that builds for aye."

It is a lesson of life—one which we all must learn. Not alone does knowledge lie in the solid fact of text-books, but in the hushed and humble study of Nature's vast tome, the pages of which are myriad, the wisdom profound, the truth imperishable. With the hope that every gardener, young and old, may find in it a source of happiness and inspiration, I, who am privileged to be the link between our good Editor, his staff, and the increasing number who become readers of the old paper year by year, join hands all round in a prayer for contentment and prosperity this Christmastide.

LUX.

THE LAND OF FLOWERS AND SUNSHINE.

An excellent idea of the physical conditions which obtain in the portions of North-western Italy and South-eastern France which generally pass under the name of the Riviera is obtained from the following brief quotations taken from a paper in the Journal of the Linnean Society for 1880 by Dr. Allman, F.R.S.: "Nowhere in Europe is there a region which, in winter and spring, basks under the rays of a more genial sun, where its mountain barriers more thoroughly defend it from the icy winds which sweep over the unprotected plains of the north; and when the season of rains is at an end, there spreads over this sunny land an atmosphere of absolute transparency; while away upon its extreme southern boundary lie the waters of the Mediterranean, flowing round wooded crags and picturesque headlands, and gleaming with an intensity of blue approached by that only of the cloudless sky which stretches over all."

"No less peculiar is the distribution of rain throughout the year. The season of rain is confined to the winter and spring months, while the summer is, as a rule, absolutely rainless."

Take the mean temperature of the seasons at Mentone, for example, and we have winter, with a mean of 49·5 degrees Fahr.; spring, 60; summer, 73; and autumn, 55·6. At Nice and Genoa the mean for winter and spring is lower, and for summer and autumn practically higher. Given these conditions, it is evident enough that gardening must be widely different in character from what obtains in England.

The native and naturalised flora is quite as interesting as the garden flora, and a few words respecting the former may not be out of place. Every gardener is familiar with the myrtle; well, this beautiful evergreen is quite common as a brushwood plant in a perfectly wild state in many places along the Riviera. Here and there on rocky ledges may be seen Lavandula spica (the source of the true oil of spike of commerce), a plant nearly allied to, but different from, the Lavandula vera, which at one time was much more widely cultivated in the neighbourhood of Mitcham, in Surrey, than it is at the present time. Then, on rocky slopes and on walls, the Caper plant (*Capparis spinosa*), the unopened buds of which constitute the capers of commerce, grows luxuriantly. Various species of cistus grow freely on hot, dry slopes, and the common Cineraria maritima, largely used in this country as a foliage plant in summer bedding arrangements, is everywhere conspicuous along the coast by its white woolly leaves and heads of yellow flowers. This plant a few years ago was highly recommended as a remedy for certain diseases of the eye.

In rocky, dry, arid spots, too, various mesembryanthemums have become naturalized, and the fleshy-leaved M. edule, with its very large yellow flowers, forms large masses on the sands almost at sea level. The so-called American Aloe (*Agave americana*) is quite at home under similar conditions to the last-named plant, but attains much larger proportions in better soil, and where it can be watered during the long, rainless summer. Indian Figs (*Opuntias*) grow, flower, and fruit freely in many places where they were never planted. The South American Yellow-flowered Tobacco (*Nicotiana glauca*) is not uncommon, and its distinct glaucous foliage and long tubular flowers render it a conspicuous object. A sure sign of water is afforded by the presence of the Great Reed (*Arundo donax*), which forms picturesque groups a dozen feet or more in height, of a particularly tropical aspect. Here in England this rarely is seen in perfection. Here and there the Wild Olive appears as a dwarf scrubby bush, the tall cultivated olive tree—much resembling large old specimens of the Evergreen Oak (*Quercus ilex*)—looks very different. Along the coast the olives are generally allowed to attain their full development, whilst inland the trees in the olive groves are generally pollarded, and do not present nearly so picturesque an appearance.

The orange and lemon are largely grown, and the latter is of considerable commercial importance for its fruits; it flowers all the year round, and at Mentone, Cannes, &c., the fruits are gathered about four times a year. Acacia Farnesiana, the fragrant flowers of which are so largely used in the manufacture of Cassie pomade, may be seen in small fields; the bushes are kept pruned into about the size of large gooseberry bushes. Here and there large plots of tuberoses may be seen, cultivated principally for the flowers, which are largely utilised in the perfume factories. The so-called Pepper tree (*Schinus molle*) makes a very beautiful small tree with its pinnate leaves and pendulous panicles of small red pepper-like fruits. The Carob, too (*Ceratonia siliqua*), is valuable for its large chocolate-brown pods, which are exported for feeding cattle.

Perhaps the most striking feature in the towns of the Riviera are the palms, which are frequently used as street trees. In Hyères, for instance, the streets are planted with the Date Palm (*Phœnix dactylifera*). A much handsomer species, and apparently a quicker grower, is that from the Canary Islands (*P. canariensis*). Washingtonia filifera, a very ornamental fan-leaved palm, is a rapid grower, and attains a considerable size. Cocos flexuosa is the most abundant of the genus, and its enormous feathery leaves, towering up above its congeners and other garden companions, produce an effect which is essentially tropical. Trachycarpus excelsa, the Chusan palm, also thrives splendidly along the Riviera; this species, however, has proved itself quite hardy at Kew.

Next to the palms the most tropical feature in Riviera gardens are the bamboos. Several species, which require in this country a stove for their successful cultivation, thrive thoroughly well in the open air. Less than ten years ago there was a fine specimen of the Giant Indian Bamboo (*Dendrocalamus giganteus*), with stems thirty feet high, in the famous garden at Villa Valetta, Cannes; this same species attains a height of about forty feet in the Palm House at Kew.

Such plants as heliotropes, pelargoniums, lantanas, verbenas, tropæolums, &c., flower all through the winter, and attain considerable size. As I write I call to mind one mass of "scarlet geraniums" growing several years ago under and amongst the pines at Monaco, which formed a tangle like the common bramble in an English wood; the bushes had thick stems, and must have been of considerable age. Allium neapolitanum, Anemone fulgens, various narcissi, and other spring-flowering bulbous plants grow in abundance under the olives on the slopes of the hills, &c., and arrest the attention of the most unobservant of visitors

Climbers on houses consist of such brilliant things as bougainvilleas,

NICE FROM MOUNT BORON.

(With white Daisies and Cyclamen).

tecomas, bignonias, ipomæas, &c., and a visit to such a land of sunshine and flowers marks an event in the life of any gardener whose experience previously had been confined to more northern latitudes.

The famous gardens of Thomas Hanbury, Esq., at La Mortola are alone worth a visit to the Riviera; in this spot are grown upwards of three thousand species of plants, and in a recently published work by an anonymous author Mr. Hanbury adds a footnote to the chapter on "Springtide": "I am disappointed if I have fewer than 450 species in flower in the open border at La Mortola in the month of January." The views of Nice and Monte Carlo, with the gardens of the villas Montebello, Montery, and Lefevre, from photographs taken by Henry Little, Esq., serve to show in an admirable way the beautiful vegetation that provides such a tropical effect in Riviera gardens at a time when our gardens at home are almost bare of flowers.

Kew. G. Nicholson, A.L.S.

PLANT ROOTS AND PLANT FOOD.

I was much interested in Mr. J. J. Willis's able contribution on plant roots and plant food on page 716. He, however, is mistaken in assuming that I deny the possibility of food-creating roots. I merely questioned the accuracy of "Lux's" statement, and pointed out the food-creating power of roots—a fact doubted by him. Of course, we all know that it is not the largest or heaviest roots that contribute most to the plant's well-being, but rather the number of these organs. The more mouths, so to speak, the better are the means afforded the plant of securing adequate supplies of food. The character of roots, large or small, will determine to a great extent the kind of food abstracted from the soil, and consequently the growth of the plant. Again, the food materials within the soil will influence the growth of roots. If nitrogen be in excess there will be a tendency to large roots, and soft, succulent, unfruitful wood in fruit trees, whereas a deficiency of that constituent and a preponderance of inorganic elements will result in firmer and more fruitful growths. The number of roots in this poorer soil will be greater, and they will also be smaller, more fibrous, and with more root-hairs than those thick, succulent productions promoted by the presence of an undue quantity of nitrogen. Knowing this, we are able to regulate fruit tree growth by judicious applications of manures. The natural kind of roots of a plant is usually demonstrated in its method of branching. If they are few and strong the roots will be the same, but should the branches be twiggy and dense, then mats of fibrous roots will almost invariably be found. This teaches us another lesson, viz., that bushy plants with naturally fibrous roots require a greater proportion of potash, phosphorus, lime, and the other inorganic elements of plant food than do plants of more strong, straggling growths and corresponding roots. I must qualify this statement and say that there are exceptions, but the exceptions are rare.

Looking at "plant roots and plant food" with these facts before us, we can easily see the error of destroying fibrous roots within the first nine inches of surface soil. Mr. J. J. Willis seems to regard "plant roots and plant food" as the chief source of contention between "Lux" and myself. He is also mistaken in this conclusion. "Lux" feeds his fruit trees, and so do I; but there is a material difference in the manner in which it is done, and it is over this that we cannot come to an agreement or compromise. "Lux" treats the roots of his trees to a surgical operation every time he supplies them with food, whereas I preserve every feeder intact. He manures and digs the ground occupied by the roots of his trees, thereby destroying them within nine inches of the surface, and mutilating others immediately below that. I surface feed, and only disturb the surface to the depth of two inches when the ground is under bush and tree fruits, and simply top-dress when the orchard is a grass one. By this system of treatment and cropping I obtain heavy yields from the land, secure healthy, fruitful trees and bushes, and a dense carpet of grass in the grass orchard. In reference to grass orchards I see a note in the Magazine, page 713, saying that the trees did not do so well this last season as trees growing where the ground was dug. As this statement is at variance with results that have come under my observation, it would be interesting to know the kind of the two soils, their situation as to securing moisture, and whether the trees in the grass orchard were surface fed. The small orchard mentioned in my former notes at Castle Howard has borne overwhelming testimony to the contrary, and conclusively proved that a grass orchard, judiciously fed and otherwise cared for, was the right place and the right way to cultivate hardy fruit trees. In Breconshire I have been looking for "Lux's" grand orchard, but find nothing but miserable specimens of fruit trees, where the surface roots to the depth of nine inches have been destroyed by manuring and digging. The few trees I have come across in grass land are much superior to them, even although they have been neglected in the way of surface feeding. If "Lux" really believes in what he is teaching I would like to show him samples of trees grown under both systems. I feel convinced, however, that he knows better, and I therefore do not take his statements seriously to heart.

"Lux's" pen is, I think, to the scribe very much what the spur is to the not over-anxious horse. So if the discussion has been the means of bringing irrational methods of fruit culture more vividly before the gardening public, and will lead to better ones being adopted, "Lux" will have done good service. Hardy fruit culture is too much under stereotyped methods, as a visit to gardens, big and small, in various parts of the country will testify. The right varieties of apples, pears, and plums to plant, to suit every purpose, and the most rational system of cultivation, should be better known and utilised. Until this is the case there is plenty of room for "Lux" to find a field for his practical intelligence, wit, and provoking but still humorous kicks, in order to bring facts to the front and expose fallacious notions.

J. Riddell.

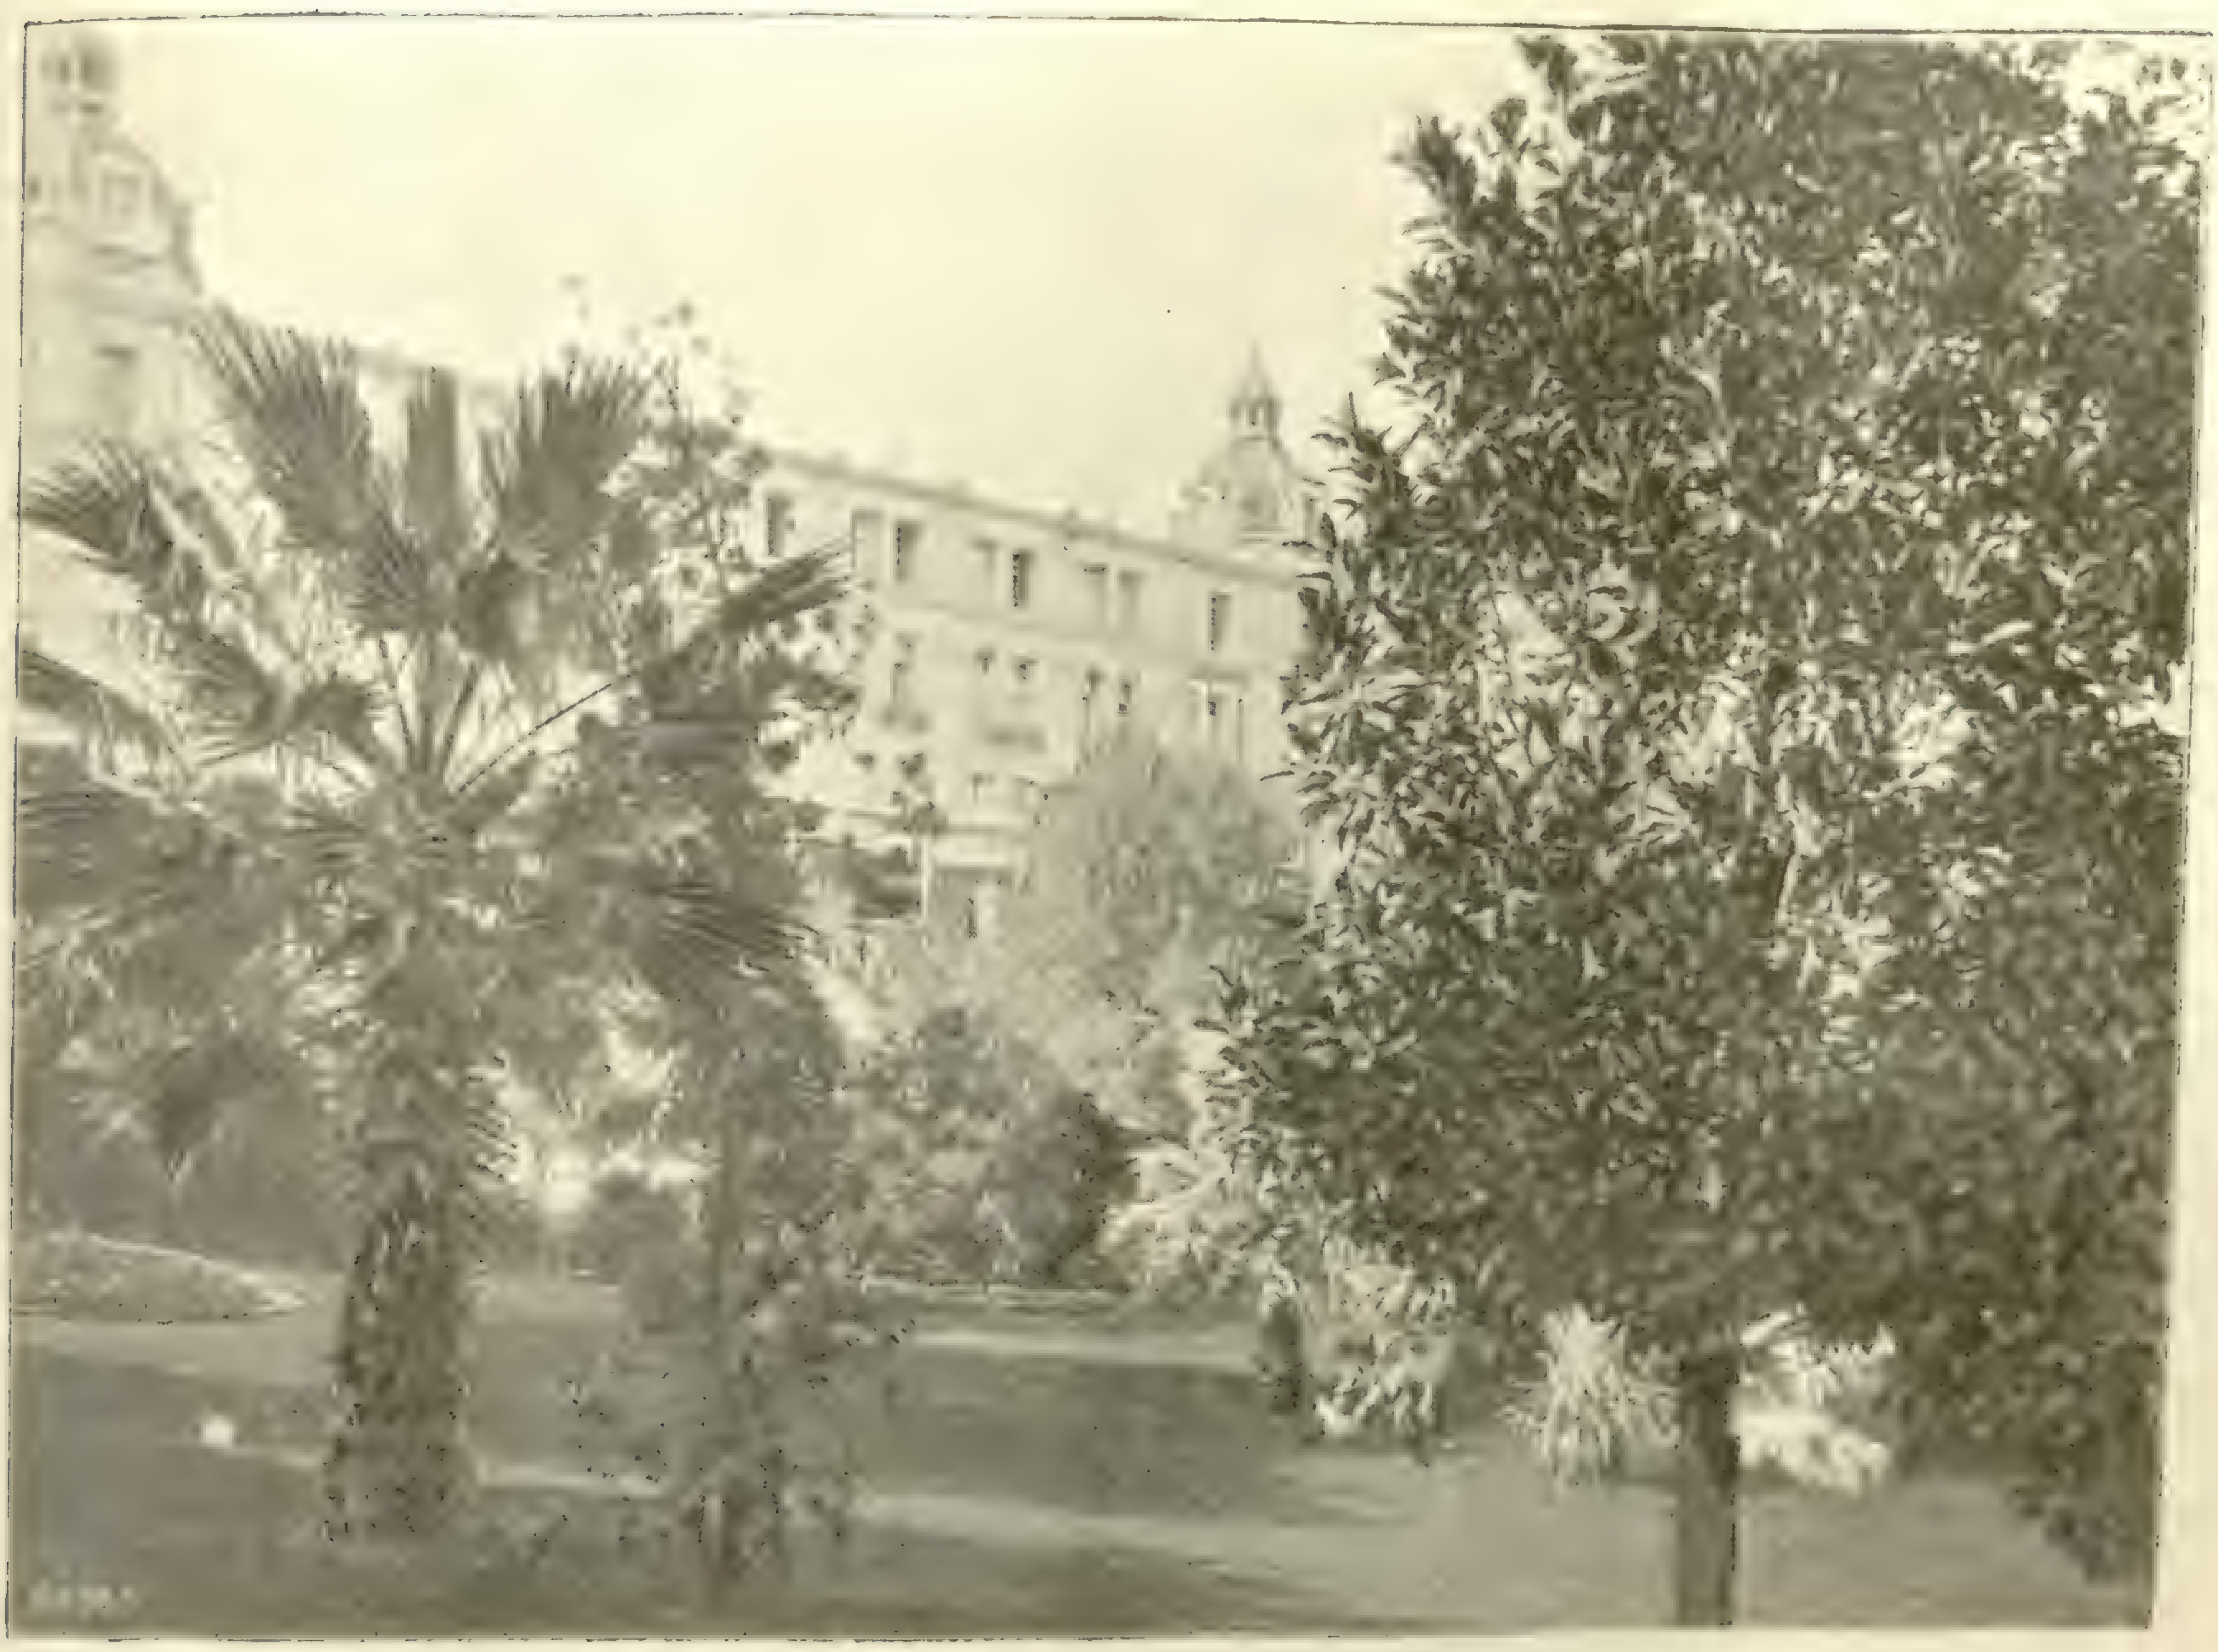
A GARDENER'S EXPERIENCES IN HONG KONG.

On my arrival in Hong Kong in the middle of December, 1891, I found things very different from what they would have been in the old country at that time. Instead of everything being bare and leafless, there was the appearance of summer everywhere. What a sight! The harbour was filled with dozens of merchant ships and hundreds of junks, and what a sight the town, built on the side of the hill, with the hilltops as a background. As a Frenchman once remarked, no one but the British could have built a town in such a place. Immediately, or rather before, our steamer was made fast to her buoy she was surrounded by a very large number of Chinese rowing boats, or sampans as they are called, and there were frantic cries from the boatmen to know if anyone was going ashore; this they did by calling out "wanchee sampan?" Naturally, we did "wanchee sampan," and as soon as we had made our want known there was a tremendous competition as to who should receive our patronage. We finally decided on one and went ashore. These boats are about fifteen feet long and five feet wide, and are, as often as not, "manned" by women. The whole family live in them, men, women, and children, and then have enough room for keeping fowls as well. It is marvellous how they manage to cook their food and sleep in such tiny craft, but a great number of things which the Chinese do are marvellous to European eyes. I believe that I am right in stating that thirty thousand (I have not the numbers with me) Chinese live in this manner in Hong Kong. They are a peculiar people and seldom mix with the people on shore. Well, on getting ashore we made our way to the Botanic Gardens.

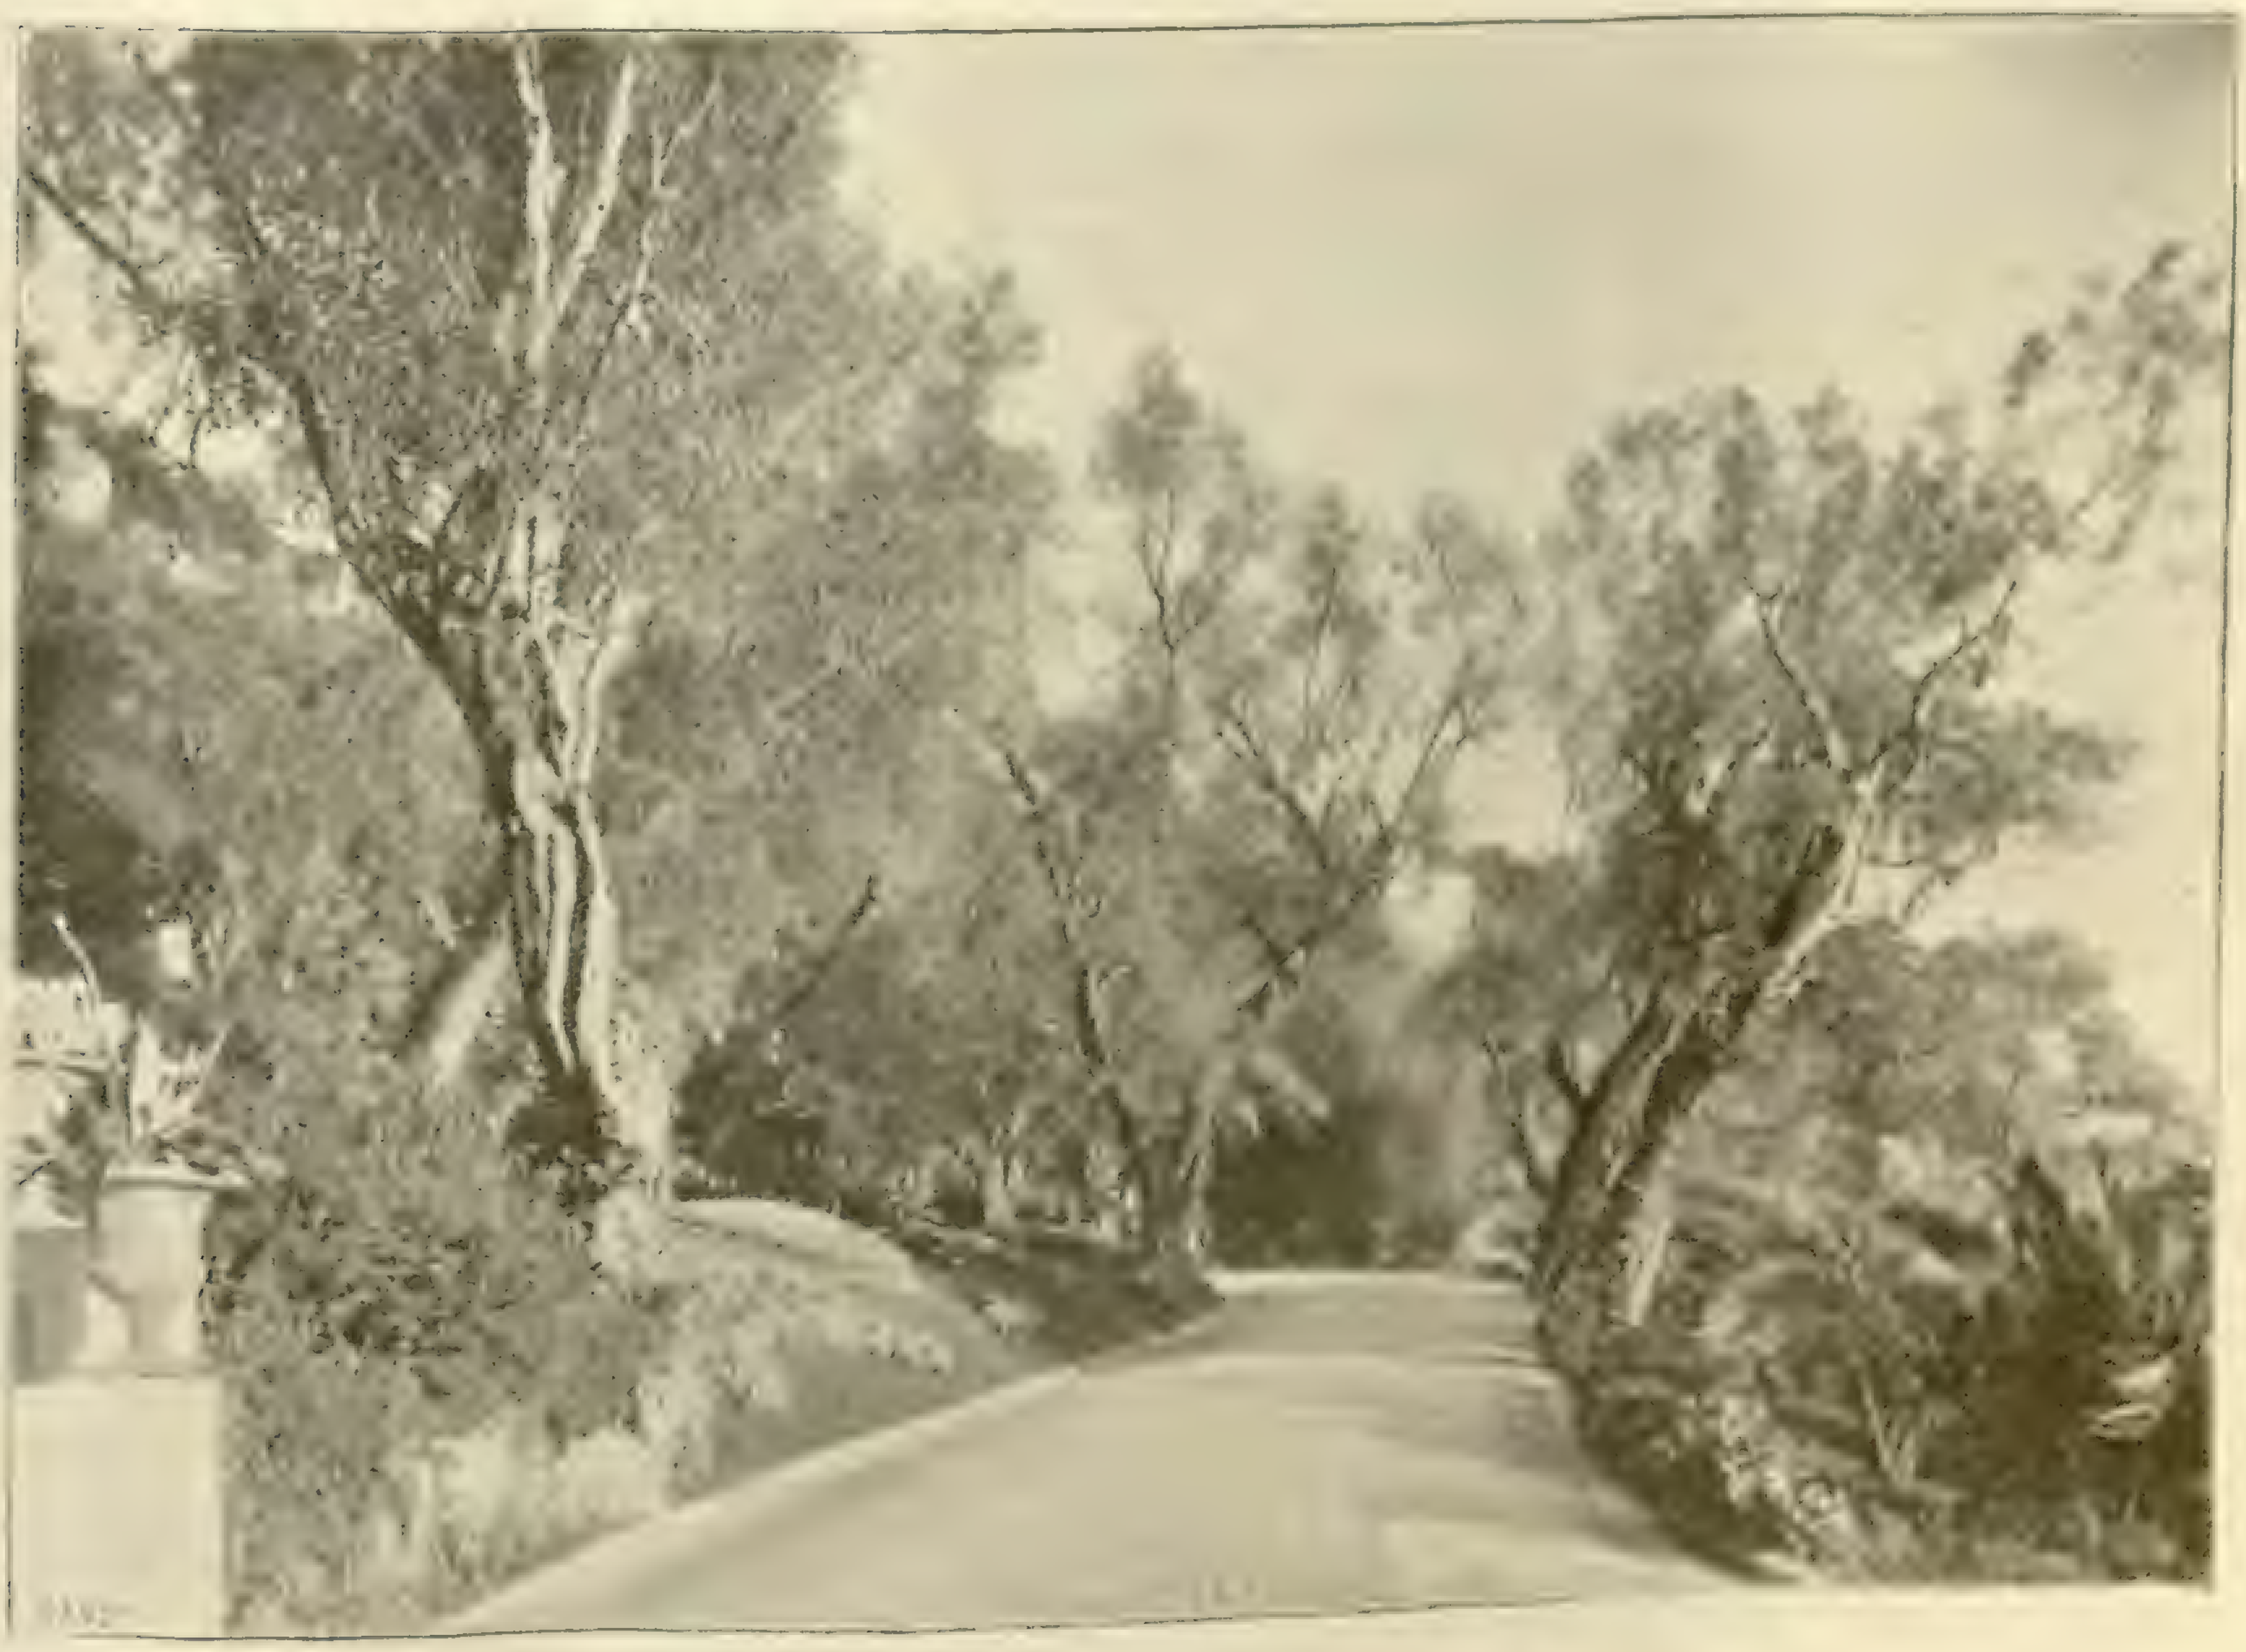
The entrance, or at least the approach, to the Hong Kong Gardens is only about two minutes' walk from the landing-stage, up a winding shady glen planted with cycads, alpinias, alsophilas, bamboos, and many other tropical plants. It was a glorious sight, and one not to be easily forgotten. No wonder that when a little girl was going up there with her mother she inquired if it were the way to heaven. On arriving at the gardens, my future sphere of work, plants and beds were gay with flowers. Geraniums and poinsettias were growing side by side in full splendour, and the tea roses were simply charming, not to mention other things. Surely winter had been turned into summer. This was a kind of thing that I had not been accustomed to, but the same may be said of everyone who goes to the tropics for the first time. You have plenty of flowers under glass at home during the winter, but it is quite a different thing to see a wealth of bloom outside. An Englishman, however, soon adapts himself to circumstances, but it is quite a different thing getting the Chinese to adapt themselves to European ways. You might argue with them until you were black in the face, and then you would be just as far off convincing them of a thing as when you started. The only way to do with them is to tell them that you want a thing done in a certain manner, and then see that they do it.

The language was a thing that bothered me a great deal at first, but I soon found out that it would be much better to get along with a mixture of English and Chinese called "pidgin English." This lingo is easily acquired, and is used by both English and Chinese in the daily routine of affairs. Pidgin is a corruption of business, and has been handed down to us from the early traders with China. Of course, in the various offices now, English is written and spoken by the Chinese as it should be. No doubt it appears very strange to hear one say to a Chinaman, "Put that piecee plant more largee pot," instead of "put that plant into a larger pot," but when one is using such phrases every day the ludicrousness of it becomes lost. Again, I should never think of telling a man to prune a tree, I should say "cut that piecee tree more short," and if I wanted it closely pruned I should say "cut it plenty more short." Upstairs is called "topside," and downstairs "bottomside." I had a rather amusing experience with one of the garden men in connection with the use of the word upstairs. A coolie was lopping a large tree in the gardens, and I inquired for him from the foreman, and this was his answer, "He have 'go upstairs makee cut that piecee tree more short." Evidently he thought that he was getting on with his English. On another occasion I sent a man to go and purchase some pipeclay for cleaning my sun helmet; imagine my surprise when he returned with two short clay pipes. After I had been out there a short time a native thought that he would astonish me by showing me the electric light, for he—in a "you have not seen this before kind of way"—inquired if we had such a thing in England, and he appeared to be quite disappointed when I told him that we had. To this day natives, coming in from out of the country places, may be seen during the cold weather attempting to warm their hands at the street gas lamp-posts when the gas is burning.

It is a great mistake to suppose that the Chinese are fond of work, at least my experience does not support such a supposition. It is true that at any place in China you will see crowds of men, women, and children working morning, noon, and night, and as a matter of course anyone just passing through any of these places goes away with the impression that the natives are a very industrious people. Residents in these places, however, know that the Chinaman only works until he has obtained a



HOTEL METROPOLE, MONTE CARLO.
From the Casino.



GARDEN OF VILLA LEFEVRE, NICE
(With Olive Trees).

sufficient sum to provide him with his day's food and lodgings ; after that he takes a rest. Consequently the crowds who throng the streets in the morning are replaced by others in the afternoon. It takes a very little to support a man and his family; in fact, the coolies employed in the gardens, and coolies in general, only get six dollars per month, which put into English money means eleven shillings and sixpence at the present rate of exchange. Of course, a Chinaman subsists on very little from our point of view. If he has a little rice with a bit of fish or vegetable added to it he is contented. A man in a better position than the average coolie, say getting ten or twelve dollars a month, is in a position to keep two wives. A man in the gardens, receiving eleven dollars a month, is in the happy position of having two better halves. How would a European manage to do such a thing on twenty shillings per month, supposing it were permissible ? If a man is in a sufficiently prosperous condition to be able to pay for a wife he has to do so, and I will tell you of an amusing case which came under my notice. A man—he was earning eight dollars per month—bought a wife for eighty dollars, and after he had been married three months his wife died. He was relating his misfortune to me, and I naturally sympathised with him, thinking that he had lost a good partner, and one to whom he was greatly attached. As he unfolded his story I found out, however, that it was not the loss of his wife he was lamenting, but the loss of the eighty dollars, and he coolly informed me that it had been a very bad speculation, and that he hoped his next venture in the same line would turn out more successfully. A Chinaman in a good position in Hong Kong who had four wives once told me that he should think Europeans had a comfortable time with only one, whereas he had a very lively time of it occasionally when the whole lot turned on him.

To a newcomer it is very amusing to watch the change which comes over some of the men during the winter season—very thin men often become enormously stout. The reason of this is they move about so slowly that they are unable to keep themselves warm, and have to put on coat after coat to make themselves comfortable. Instead of seeing a man with a coat of many colours, you will see him with many coats of many colours, and when he has a dozen on, which is not at all uncommon, his sudden obesity is easily explained. They have a great dislike to be hurried over anything, and if you want a thing done quickly you had better do it yourself. Suppose that you have ordered something from a tradesman, and he has failed to finish it by the time promised, if you speak to him about it he will tell you that there is another day tomorrow, and you will find that there are a good many to morrows before the thing is completed. As the summer comes on the stout gentlemen gradually assume their natural proportions again, and in the height of summer all that they burden themselves with is a pair of pants, made as short as possible. Of course, I am speaking of the working class, as the labourer is always in the majority.

The coolie class, generally speaking, is illiterate, but one day, in my peregrinations, I thought that I had come across an exceptionally intelligent individual in the shape of a naturalist. I was passing by this particular person's garden when I saw that he was equipped with a butterfly net, and was in the act of catching some of those beautiful insects. I stopped and inquired of him his reason for catching those insects, expecting, of course, to hear that he was making a scientific study of them ; but, alas ! my hopes were doomed to disappointment. He said, "What for my makee catch that piecee butterfly ? Why, bye-en-bye he have got plenty smallee piecee worm ; he makee chow-chow my piecee cabbagee"—which, put into English, meant that his cabbages would be eaten up with caterpillars unless he caught the butterflies, and prevented them from laying eggs. Whilst on the subject of insects I might mention a few of those which Europeans find objectionable, and I will begin with mosquitos. Newcomers suffer from these blood-suckers a great deal, but after they have been in the tropics for a year or two their blood is not rich enough for the mosquito's delicate palate, and they are generally left alone. These pests like the genuine, pure, and unadulterated article best. Wrists and ankles are their favourite feeding places, and they can pursue their nefarious practices through a thick woollen garment quite easily. You are just dropping off to sleep when you hear a slight buzzing sound at your ear, and you know at once what is the cause of it. You make frantic efforts to silence it by attempting to kill its producer by beating the air madly with your hands in all directions, but in vain. After a restless half-hour or so you get a light and settle the question once for all, as you think, for there is no sleeping until the buzz has been silenced. You then turn into bed again, under the impression that "something attempted, something done, has earned a night's repose." But you are mistaken, for in a few minutes you hear another buzz even stronger than the first, and the same pantomime has to be gone through again. Many people defy these insects by sleeping under mosquito curtains, and it is certainly very pleasant to hear them buzzing around you when you know that you are safely out of their reach, but the worst of it is it is so frightfully hot underneath curtains.

Cockroaches are innumerable, and often do much damage. They are particularly fond of the covers of books, and woe to the new arrival's library unless he has been warned of the ravages that these pests commit. For leather goods they also have a peculiar fondness. Books may be preserved from their depredations by giving them a coat of Chinese varnish as soon as you obtain them. One of the most destructive insects, if not the most destructive, is the so-called white ant (termes), which is not an ant at all. Books, clothes, furniture, and many other things are often destroyed before their owner has the slightest suspicion that anything is amiss. Boxes full of goods, standing on the floor without anything underneath them, are nothing but mere shells when you go to open them, unless you have paid constant attention to them. The ants commence underneath the boxes and work upwards, devouring boxes and goods as they go. The roofs of houses and beams of floors are often destroyed by these insects. An auctioneer was having a sale in a house in Hong Kong, and he had no sooner said "Going, going, gone," than the floor gave way, and auctioneer, buyers and goods were precipitated to the basement below, some of the people receiving serious injuries. The fact of the matter was the beams of the floor had been destroyed by white ants, and the unusual weight of so many persons had caused them to give way. Centipedes are sometimes met with in old houses, and their bites are very dangerous. It is seldom, however, that people are bitten by them. Some of them are fine, big fellows, six inches in length and an inch in breadth, of a rich chestnut colour, which sometimes changes to green. Of reptiles snakes may be mentioned. There are many kinds found on the island, both poisonous and non-poisonous, but it is very rare indeed to hear of a snake bite. The cobra is included in the list of poisonous ones, and the rock snake, a reptile about eight feet long, in the non-poisonous list.

So far I have not mentioned our seasons, although I stated that it looked like our summer at the time of my arrival in the colony. Well, we divide the seasons into two only, the hot and the cold, and do away with spring and autumn. The hot season commences in April or May, and lasts until the first or second week in October, and as a matter of course the cold season must be from October until April or May. The seasons agree with the monsoons ; when the south-west monsoon sets in our summer begins, and when the north-east monsoon comes in our winter comes with it. The summer is also the rainy season, and during its six months we have nearly the whole of our rainfall, on an average about a hundred inches a year. During the winter very little rain falls, and this season is certainly very much like an English summer, perhaps a little colder at nights towards the end of January and the whole of February. Our temperature during the summer ranges from 85 degrees to 94 degrees Fahr. in the shade during the day, and from 80 degrees to 85 degrees Fahr. at night. About three months ago people in London were crying out with having to put up with a week or two of high temperature, but what would they do if they had six months of it? I suppose they would become accustomed to it and take it as a matter of course, the same as we do. During the summer we have what are locally termed typhoons, another word for circular storms. The amount of damage done by them is very considerable when the colony receives the full force of such a gale. Trees and houses are blown down, and junks and ships are driven ashore. The force of the wind is tremendous, and I have never experienced anything like it in England, although other people may have. I remember once being carried off my feet in one of these storms, and sailing along quite merrily for a considerable distance towards a brick wall. It was a new wall and I did not want to damage it, but I was at a loss to understand how I was going to prevent it, for I was travelling at a good rate. Suddenly I alighted on my feet about ten feet from the wall, and you may be sure I breathed freely again when I fully realised that the wall remained undamaged. Whilst I have been in England I have often been asked if it rained continuously during the rainy season when I have been telling people that we had a rainy season of six months. In case there are any others who are in doubt on the subject, I may as well state that we have much fine weather through the summer. The fine days, however, are very humid.

Many folks ask how we live in Hong Kong, what we eat and what we drink ; they seem to think that we live in a barbarous country, and exist on nuts and roots. Well, we obtain very much the same kind of eatables and drinkables as people in the old country. Fowls, beef, and mutton are to be had at all times, and game when in season, as well as turkeys and geese. Vegetables, such as cabbage, cauliflowers, spinach, turnips, carrots, vegetable marrows, kidney beans, peas, and celery, are obtainable during the winter months ; and Chinese spinach (a species of Amaranthus), bringals, octros, sword beans (Onavalia), and sweet corn through the summer. Lettuce, watercress, and mustard and cress can be had all the year round. We miss the English fruits, such as strawberries (although we are beginning to be able to grow them), raspberries, gooseberries, and currants. Apples are imported from Australia and California, and pears come from North China. Tropical fruits that we have include mangoes, pumelos (or grape fruits, as they call them in the West Indies), persimmons, lichees, pineapples, bananas, and oranges. There are two or three dairy farms in the island, so that we can obtain new milk daily. Many things are imported from England in tins, such as butter, jam, and pickles. Wines and spirits are also imported, and as there is no duty on them they are much cheaper than they are in England. Good Manila cigars may be had at three dollars (6s.) per hundred, and as they are so cheap very few people smoke pipes. The Chinese are great smokers, their favourite smoke being the cigarette, made from Chinese tobacco, and generally very strong, and not at all palatable to Europeans. There are two or three very large sugar refineries in the place, so that we can sweeten our tea or toddy—if we take it—according to taste.

March and October are the two busiest months in the gardens for seed sowing. In the former month we sow our flower and vegetable seeds for our summer supplies, and in the latter month those which are to give us our winter supplies. Nearly all goods, whether light or heavy, are carried by the Chinese by means of bamboos across their shoulders. It is very seldom that they use a wheelbarrow or trolly. It is a quite common thing to see a Chinaman with a bamboo across his shoulder with a small basket of goods, weighing three or four pounds, on one end of it, and a stone or brick on the other end to balance it. We travel by means of jinrickshaws, or rickshaws, as we shorten the word down to, and chairs. The rickshaws are small, two-wheeled carriages with shafts fixed to them, pulled by coolies ; and it is surprising the distance a coolie will take you, going at a good speed, without stopping. On a good level road they can go quite easily for five miles without resting. The chairs are generally used for hill work, and are carried by two or four coolies. From the town to the peak, 1,400 feet up, at which a number of people reside, a cable tramway is laid, so that you can enjoy a cooler atmosphere within about ten minutes of the busy centre.

Hong Kong Botanic Gardens. W. J. TUTCHER.

SUTTON'S
VEGETABLES AND POTATOES
FOR EARLY WORK.

Copyright S. & S.

CABBAGE, SUTTON'S EARLIEST. **From a photograph.** Per packet, 1s. and 1s. 6d.

This very distinct Cabbage increases in favour annually. The habit is dwarf with scarcely any outer leaves. Hearts large, tender, crisp, and of excellent flavour; but the chief merit is that they come very quickly.

"I sowed your Earliest Cabbage on the 5th of March and cut on the 5th of June. I shall not grow anything else for early work. I cannot speak too highly of it."—Mr. A. MYSON, Gardener to F. R. Rodd, Esq.

SUTTON'S GREEN GIANT BROAD BEAN.

This is really a green-seeded counterpart of Sutton's Exhibition Longpod, one of the most remarkable and popular Beans yet raised; and those who prefer green-seeded Beans have now at their command as heavy a cropper as the best of the white-seeded varieties. Per quart, 2s. 6d.

SUTTON'S FORCING DWARF FRENCH BEAN.

Dwarf, prolific, and quick in producing the crop. No other Kidney Bean possesses in the same degree the essential qualities for culture under glass. Per quart, 2s. 6d.

"I can speak emphatically in praise of your Forcing Dwarf Bean. It crops well, and is very valuable for forcing."—Mr. A. J. SANDERS, Gardener to Viscountess Chewton.

SUTTON'S INIMITABLE FORCING CARROT.

The earliest Carrot in cultivation, and the most suitable variety for forcing. Makes an elegant side dish, and the flavour is delicious.

Per ounce, 1s.

"Your Forcing Carrot is the quickest and best I ever grew."—Mr. W. GURNEY, Gardener to J. P. Bryce, Esq.

SUTTON'S EVERY-DAY CUCUMBER.

Raised by Mr. Owen Thomas, of the Royal Gardens, Windsor, and awarded a First-class Certificate by the Royal Horticultural Society, March 8, 1898. The distinguishing feature of this Cucumber is that it meets the requirements of all seasons of the year, and may be grown continuously—hence the name. Per packet, 3s. 6d.

SUTTON'S ROYAL JUBILEE MELON.

A magnificent Melon; fruits large, handsomely netted, possessing deep rich green flesh of the most superb flavour. Per packet, 1s. 6d. & 2s. 6d.

"At my employer's picnic the guests said your Royal Jubilee Green-fleshed Melons were of lovely flavour and could not be better. I grew them in a cold frame facing south by sun-heat alone."—Mr. C. SYMONS, Gardener to Mrs. Bassett.

SUTTON'S SELECTED AILSA CRAIG ONION.

The largest Onion in cultivation. Unsurpassed for exhibition; very fine flavour. Per packet, 2s. 6d.

Mr. BOWERMAN, the Champion Onion Grower, says:—"Your strain of Ailsa Craig is the best I ever had. I have received letters from all parts asking me where the seed can be got. I have told them all that I had mine from Messrs. Sutton."

SUTTON'S HARBINGER PEA.

One of the most remarkable of our recent introductions; altogether superior to American Wonder for early border work. Per quart, 3s. 6d.

"From a sowing made on February 1 I have some grand pots of your Harbinger Pea now (April 5) in full pod grown in a cool house all along. The manner in which they have grown and podded is surprising."—R. H. F. WHITE, Esq., Aghavoe Grange.

SUTTON'S EARLIEST OF ALL RADISH.

Much prized for its charming colour and earliness. When only three or four leaves are visible the roots have attained a suitable size for table. Per ounce, 8d.

SUTTON'S EARLIEST OF ALL TOMATO.

Unquestionably the earliest red Tomato in cultivation. Fruit of medium size, brilliant red colour. Very prolific and of superior flavour. Valuable for amateurs' gardens as well as for large establishments.

Per packet, 1s. 6d. & 2s. 6d.

"Your Earliest of All Tomato I believe to be the very best variety yet introduced for all round purposes. It comes in first, is a good setter, fruits continuously, and is good indoors or out."—Mr. G. W. SYMES, Gardener to Mrs. Hayden.

SUTTON'S RINGLEADER POTATO.

Maintains its position as the earliest Kidney Potato in cultivation Flavour and quality excellent as soon as the tubers are large enough to lift. Per 14 lbs., 5s.; per ½ cwt., 17s. 6d.

"I have to-day (April 20) dug your Ringleader Potato in the open border. I think this the earliest Potato in cultivation."—Mr. B. GRIST, Gardener to Mary, Lady Hamond Græme.

IMPORTANT FEATURES.

Our invention, by increasing the width of Centre Casting and continued through to the under row of Top Pipes, assures a free circulation of Hot Water from Fire Box to upper rows of pipes. This is important, as it prevents concussion of the water in boiler when being sharply driven.
To prevent the possibility of leakage, each pipe is machine faced on flanges, and all turned to gauge.
Tested to a pressure of 60 lbs. in our works before despatch. Full information and prices on application,

Offices and Warehouses, SOUTHWARK STREET, LONDON, S.E.

BOTANICAL MUSEUMS.

IN times gone by the very name of a museum was sufficient to indicate to the minds of children or young people a dull, mournful building, filled with mouldy and musty specimens that had no attractions for a juvenile understanding, and very often but little meaning to that of an adult. No museum was thought to be complete without its Egyptian mummy—indeed, it was often the sole attraction. Museums in those days were collections of the most incongruous objects. All branches of science were more or less included, but often geology, zoology, botany, ethnography, and other sciences were hopelessly mixed up in a haphazard kind of way. The more general character, indeed, that a museum assumed the more it was appreciated by those who found pleasure in visiting these "old curiosity shops." Museums devoted exclusively to illustrating any one branch of science were scarcely known, while at the present day we find them being established not only in our large public schools, but in almost every elementary school, and botany is by no means left behind in this respect. On the contrary, botanical museums may be, and are, of different characters at the present time, such, for instance, as those attached to the Universities, which contain valuable stores of carefully prepared specimens to illustrate the scientific teaching of the study of botany, such as the different parts of the flowers, seeds, fruits, leaves, &c., or the structure of the stems. On the other hand, there are museums, such as those at Kew, which give special attention to the products of the vegetable kingdom, as furnishing material for supplying articles of food and medicine, and manufactures, as clothing, building, and such like. That a museum of this nature can be made popularly attractive is proved by the great number of visitors who frequent the well-known museums in the Royal Gardens, Kew, and also from the use that is made of them by commercial firms in London and the large business centres of England. The Kew Museums stand in the honourable position of being the first of the kind ever established, and their origin is due to Sir William Hooker, the first director of the Royal Gardens, who gave his own private collection as a nucleus upon which to start, the success of which has been so great that it is only repeating a well-known fact to say that the collections contained in the three museum buildings at Kew are far and away the finest and most complete in the world. Moreover, they have been taken as a pattern for establishing similar museums in many of our colonies as well as in foreign States.

In the formation of a botanical museum there are two ways in which the objects may be arranged, namely, by a botanical or a commercial classification, that is, by the system adopted at Kew, where the objects are arranged scientifically, according to the nature of the plants producing them; or, on the other hand, by a commercial arrangement, where food products, such as fruits, would be kept together, starches and meals together, drugs, oils, perfumes, &c. It stands to reason that the first arrangement, namely, the botanical classification, is more suited to museums situated in a botanic garden, such as those at Kew, while in a commercial centre the second form of arrangement would undoubtedly be the most useful.

It is difficult to believe that any of my readers are unacquainted with the Kew Museums and their arrangement, but lest there should be any it may perhaps be well to give a brief outline of such arrangement. The natural orders follow each other in the sequence adopted in the "Genera Plantarum" of the late Mr. George Bentham and Sir Joseph Hooker, commencing with Ranunculaceæ, and finishing with Gramineæ. In each order the genera are arranged in the same sequence, and all the products, be they food products, drugs, fibres, oils, or what not, are placed in the genus or species to which the plant refers. Thus in Papaveraceæ we are shown the poppy heads, or fruits of Papaver somniferum, the opium poppy, scarified to show the exudation of opium, with the actual instruments used for incising the fruits, and all the vessels and paraphernalia used in India in the preparation of opium for the market, and finally the prepared opium itself; a series of alkaloids, for which opium is valuable in medicine as well as an opium smoker's complete equipment; and further, samples of the seeds which, under the name of "maw" seeds, are given to cage birds. These seeds abound in a sweet oil which is expressed and used for mixing with olive oil for table use. From such a series as this we gain the information that the white poppy yields opium from its fruits, that it flows in a milky form from slits made in the fruits, that it becomes semi-solid and black by a system of manipulation, that it is smoked in or on peculiarly constructed pipes, that it yields a number of valuable alkaloids, as morphine, codeine, &c., and further, that though the juice is a powerful narcotic, the oil contained in the seeds is perfectly harmless and sweet, and is used as a table oil. This is just one illustration of the information sought to be conveyed by such a museum as that at Kew, and, everything being fully and descriptively labelled, it is not difficult to understand, but space will not allow us to multiply instances of classification.

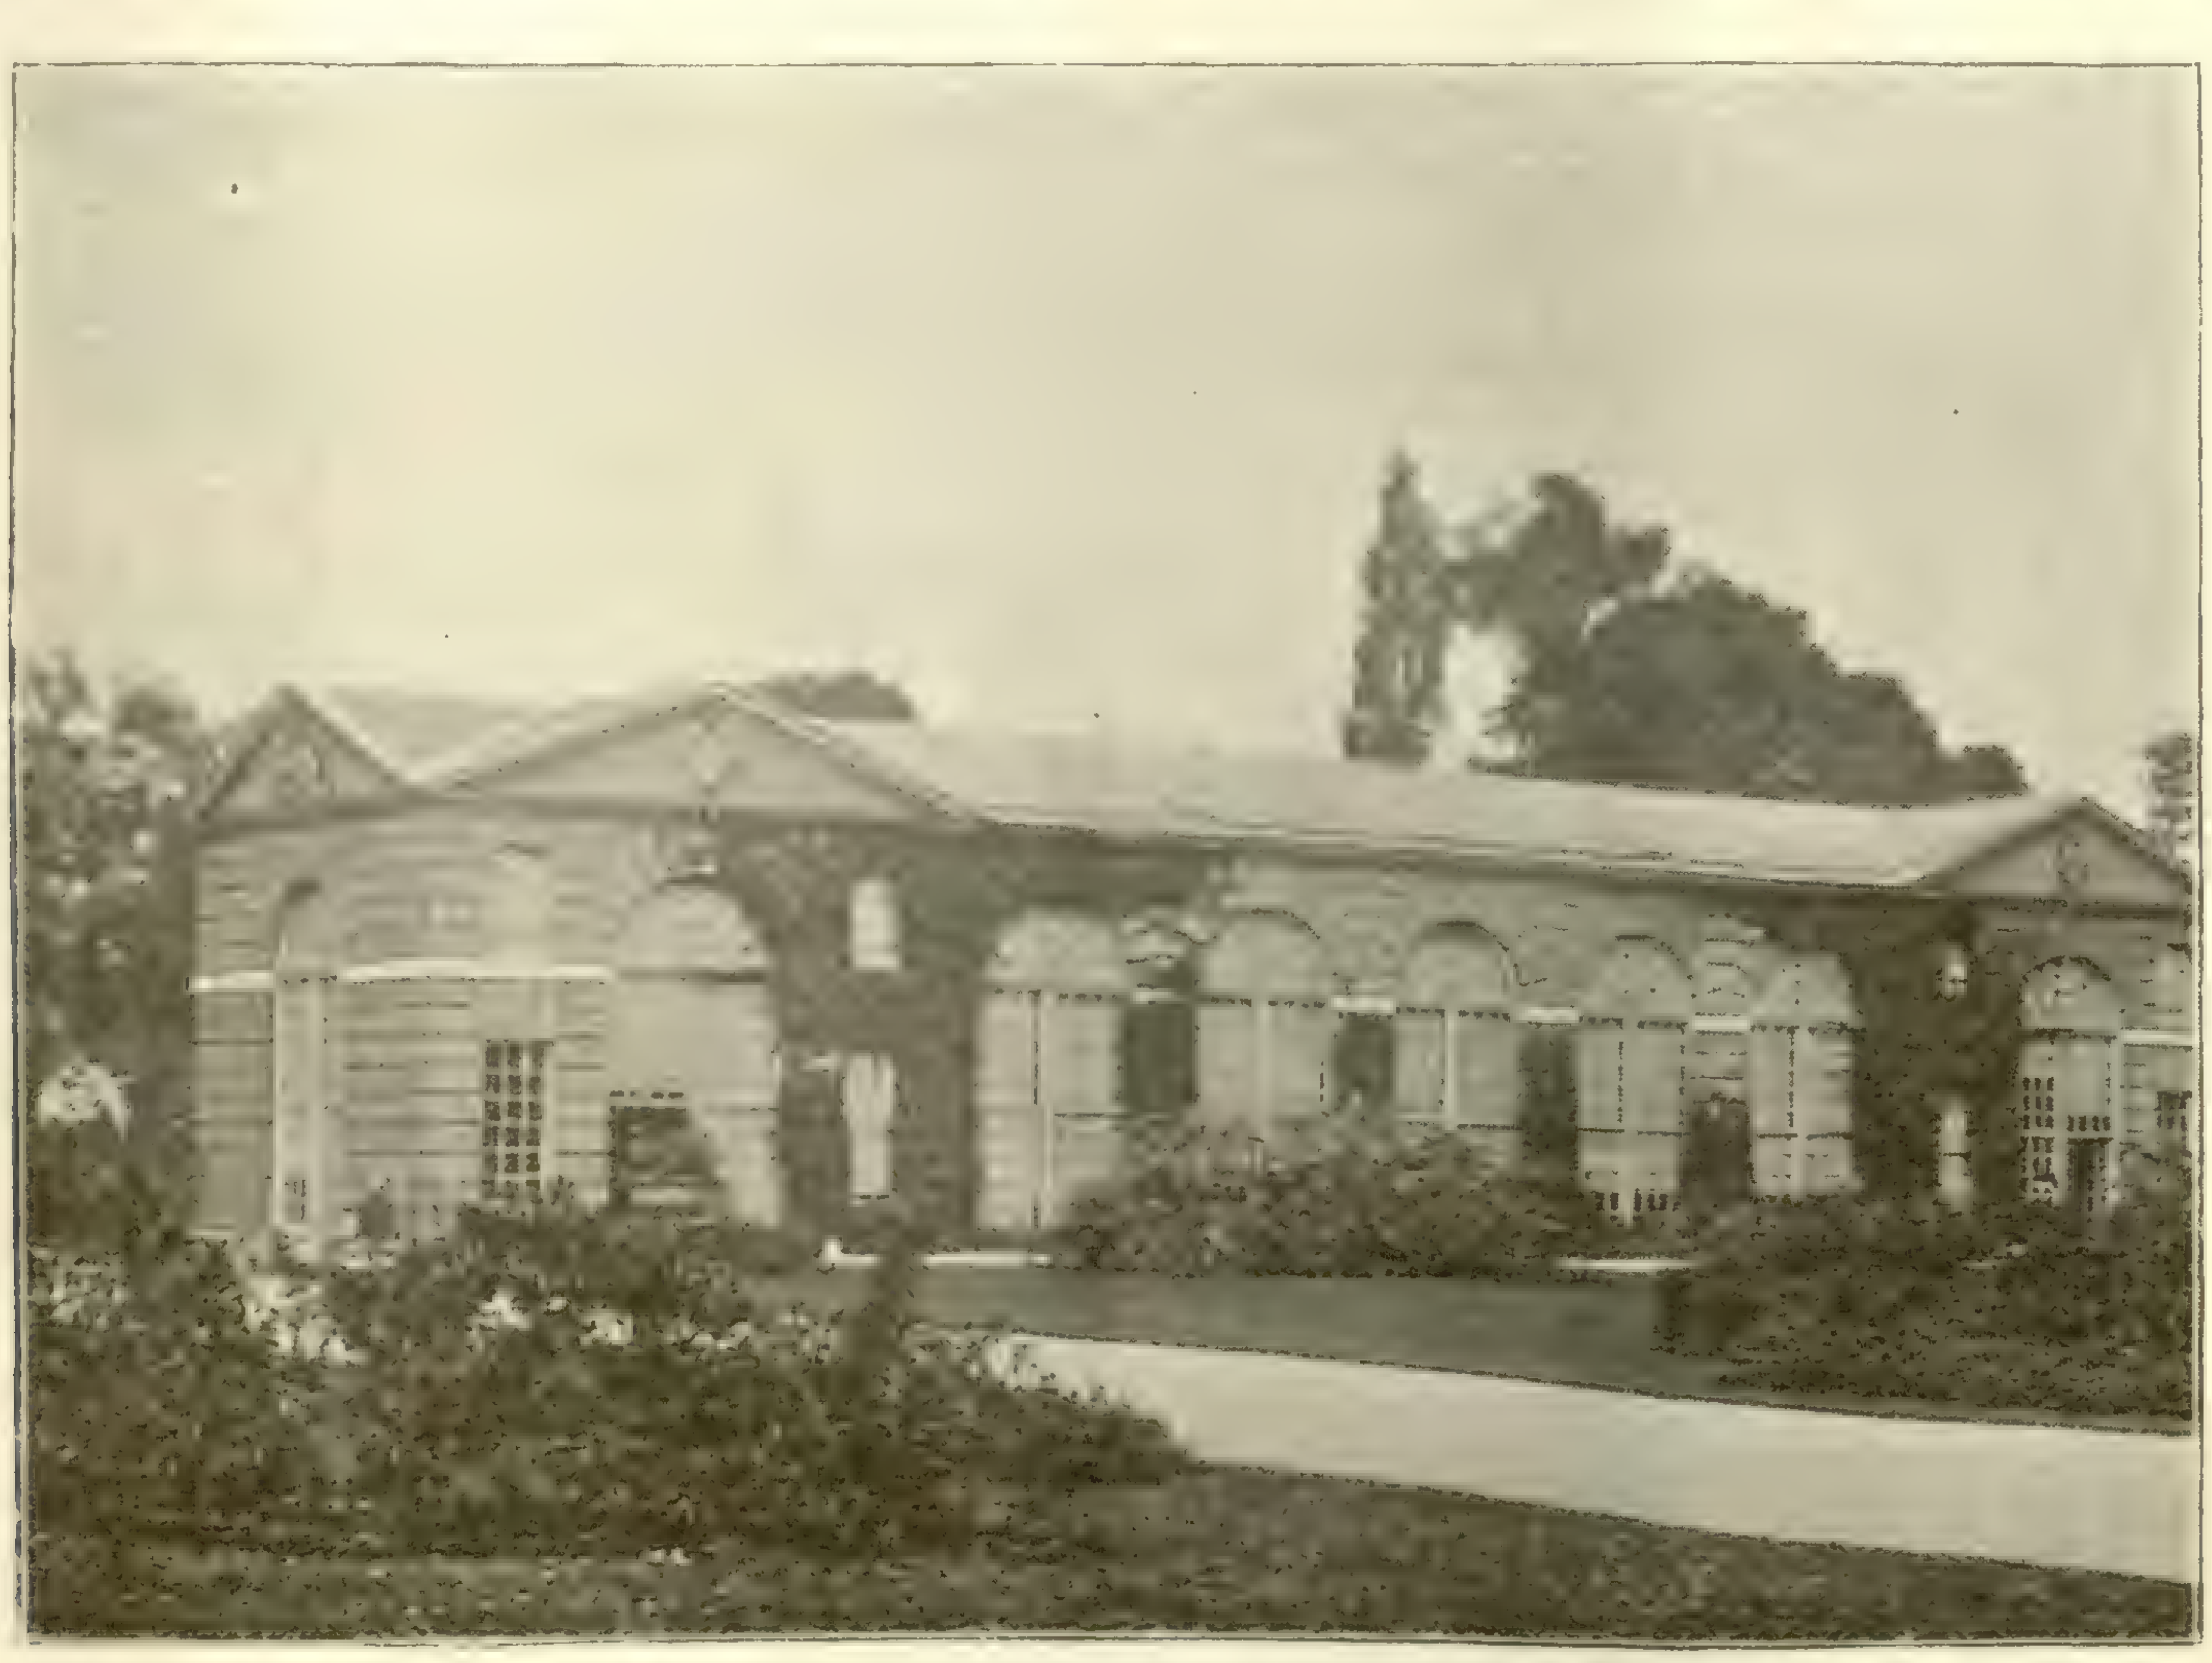
A description of a few of the most interesting objects will perhaps be of more particular interest, and none more so, probably, than the collection of wreaths and chaplets from the tombs at Thebes, where at periods of 1100 to 1200 B.C. they were used to adorn the mummies which were so carefully placed in their enduring receptacles that they have in many instances come out to-day almost as fresh as when they were first placed there, and so perfect in form that it has been quite possible to determine the species of plants that were so used. Of these may be noted the following: Nymphæa cærulea, the colour of which was distinctly blue when first discovered, but which has since turned brown by exposure to light and air: some very beautiful wreaths are composed of the flowers of this water-lily and leaves of Mimusops Schimperi strung or twisted on strips of date palm leaves. This wreath was found in the coffin of Rameses II., of the date 1100-1200 B.C. Another wreath of a like date is composed of the leaves of Salix safsaf and the flowers of Acacia nilotica. Perhaps some of the most perfect of the single flowers taken from any of these wreaths are those of Narcissus Tazetta, Chrysanthemum coronarium, and Centaurea depressum. Turning from these interesting relics of a remote age, we find in another part of the museum, in a special case, a remarkably fine specimen of the New Zealand sheep plant, a tufted plant of the Compositæ, growing often in huge masses quite as large as an ordinary sheep, and having a shaggy appearance very similar to the wool of a sheep, so that shepherds are said to be often deceived by them in the dusk of the evening, more particularly at distances on the mountains. The New Zealand sheep plants belong to the genus Raoulia, and are referable to two species at least, namely, R. eximia and R. mammillaris. The only use to which the plants are put in New Zealand is by ladies for making pincushions, by covering a small portion with silk or other fabric. Continuing our wanderings further, and by studying the products of the Anacardiaceæ—an order which includes the mango, the cashew nut, pistachio nut, and the species of Rhus which ornament our gardens—we find under Rhus vernicifera a

GENERAL MUSEUM, KEW.

very complete and interesting series of what is known as Japanese lacquer ware, which are beautiful and artistic designs in caskets, boxes, trays, bowls, sword cases, &c., the foundations of which are of wood, thickly coated with numerous layers of fluid lacquer which is drawn from the trunks of the species of Rhus mentioned above, and prepared in a variety of ways by mixing with numerous colours or with gold and silver. In the old lacquer ware, of which the Japanese were the sole masters, so long and tedious an operation was its preparation in depositing the successive layers of lacquer that actual plates of gold and silver, mother-o'-pearl, slices of shells or stones were worked into the design, and covered with layer upon layer of lacquer, and the whole rubbed down to an absolutely smooth and unbroken surface, capable of lasting for an indefinite period. Many examples of this beautiful work can be seen in the Kew Museum side by side with half-finished work and the crude materials and tools used in its manipulation.

If our inclination leads us from peaceful arts to warfare or the chase, we shall find many illustrations in the Kew Museum of such articles. Arrows, spears, and darts are not unfrequently poisoned by savage tribes, to make their aim more deadly, and many of these poisons are of vegetable origin. The best known is no doubt that of the upas tree (*Antiaris toxicaria*), a large tree of Java and Borneo, the poisonous juice of which is obtained from the bark. Of late years it has been the subject of considerable attention by chemists, notwithstanding that the poisonous nature of the tree has been known for one hundred and twenty years or more. The poison valley of Java with its upas trees was one of the most interesting stories in botany of our boyhood, which in the light of modern science we can now afford to laugh at. As the most recent examination of upas poison has been made almost at the time we are writing, and has been embodied in an address on arrow poisons delivered to the North British Branch of the Pharmaceutical Society, by Dr. Ralph Stockman, we take the opportunity of quoting from his interesting statements. The active principle is known as Antiarine. It is extremely poisonous, and experiments made by Dr. Stockman showed that 1-6400th gr. was sufficient to kill an ordinary-sized frog in comparison with 1-4500th gr. strophanthin, and 1-2600th gr. urechitin. The sap is known as Ipoh Kayu (tree poison) among the natives. It kills guinea pigs and other small animals in a few minutes from stoppage of the heart, and has been used in Cochin China against the French soldiers, who died in from half an hour to several days after receiving their wounds. It is in use throughout the Eastern Archipelago by nearly all the native peoples, pure, or mixed with snake poison, scorpions, centipedes, other plants, and occasionally with arsenic.

Regarding the extraordinary stories that have been told about the deadliness of the upas tree, Dr. Stockman says they are traceable to an account of the tree written last century by a Dutch surgeon named Foerscher, whose account was copied as genuine into a number of the periodicals of the time, and thus obtained a wide circulation. The following is an extract from this Dutch doctor's description: "I shall now only relate simple, unadorned facts of which I have been an eye-witness. In the year 1774 I was stationed at Batavia, and during my residence there I received several different accounts of the Bohon upas and the violent effects of its poison. They all seemed incredible to me, and I resolved to investigate this subject thoroughly, and to trust only to my own observation. . . . . I had procured a recommendation from an old Malayan priest to another priest who lives on the nearest habitable spot to the tree, which is about fifteen or sixteen miles distant. The letter proved of great service to me in my undertaking, as that priest is appointed by the Emperor to reside there in order to prepare for eternity the souls of those who for different crimes are sentenced to approach the tree and to procure the poison. Malefactors, who for their crimes are sentenced to die, are the only persons who fetch the poison. After sentence is pronounced on them by the judge they are asked in Court whether they will die by the hands of the executioner, or whether they will go to the upas tree for a box of poison. They are afterwards sent to the house of the old priest, and remain some days, during which time the ecclesiastic prepares them for their future fate by prayers and admonitions. When the hour of their departure arrives the priest puts on them a long leather cap, with two glasses before their eyes, which comes down as far as their breast, and also provides them with a pair of leather gloves. The worthy old ecclesiastic has assured me that during his residence there, for upwards of thirty years, he had dismissed above seven hundred criminals in the manner which I have described, and that scarcely two out of twenty have returned. He showed me a catalogue of all the unhappy sufferers with the date of their departure from his house annexed, and a list of the offences for which they had been condemned. I was present at some of these melancholy ceremonies."



WOOD MUSEUM, KEW.

The horrors of the upas have now passed, and it is no longer necessary to go to Java to learn its mysteries, which are now unfolded, and its nature and properties are fully exhibited in No. 1 Museum at Kew, amid the pleasant surroundings of the Royal Gardens, as shown in our picture. Indeed, all those objects which we have already referred to are to be found in this same building. In the other picture, which is an excellent representation of No. 3, or the Timber Museum, is arranged a very fine collection of the choice woods of the Empire of India and the British colonies, arranged in a geographical sequence according to the countries producing them. This building was formerly known as the Orangery, and for many years after the gardens were opened to the public it was used in winter for the storage of such plants as could be placed out of doors during the summer but required shelter through the winter. The erection of the central portion of the Temperate House left this building free, and it was at once converted into a museum for large specimens of timber, and a few other objects requiring special cases that cannot be accommodated in the arranged collections in Museums Nos. 1 and 2. One such special collection is of peculiar interest, as it is devoted entirely to illustrating the uses to which bamboos are put in Japan, and is the more valuable just now when bamboo culture in this country is attracting so much attention. Space will not allow us to do more than mention the existence of still another museum, which is officially known as No. 2. In this building are arranged the monocotyledonous orders, such as Scitamineæ, Liliaceæ, Palmeæ, Graminaceæ, and the Cryptogams. Thus advantage is taken in the three buildings of dividing their contents into the dicotyledons in No. 1, the monocotyledons in No. 2, and the timbers and special objects in No. 3, each of which is equally valuable both from a scientific and from a commercial point of view, for all the collections are made much use of by those engaged in trade and commerce, as well as by the teaching profession.

JOHN R. JACKSON, A.L.S.,
Keeper of the Museums.

Royal Gardens, Kew.

FORCING LILACS.

EARLY forced flowers are always much appreciated, and none more so than the Persian lilac. This old-fashioned, but ever popular, shrub ranks as one of the most valuable for forcing, requiring but a small amount of trouble to bring it to perfection, the most essential points for the cultivator to keep in view are: The proper time to start the plants so as to produce flowers when they will be in greatest demand, and the thorough maturing of the wood during the preceding season of growth, for on this depends in a great measure the success of forced plants.

It is indispensable that the forcing should be commenced gradually at first; a temperature of 50 to 55 degrees will be ample for the first week or nine days. Afterwards keep the structure in which the plants are placed more moist, with a corresponding rise in the temperature, but at no time should more than 65 or 70 degrees be accorded lilacs. Various methods are adopted in the procuring of suitable plants. Some gardeners prefer to purchase the stock, or a portion of it, from a nurseryman. These are usually well-grown and ripened, therefore almost certain to give good returns, and such may, when over for the season, be either planted out in the shrubbery, or in the reserve garden, for forcing either one or two years hence. Others depend largely on plants grown by themselves in various sizes. A stock of these may be raised annually or biennially as required, by lifting strong suckers from around an old tree that has become established in the shrubbery. The buds which have formed below the surface of the soil, and a few inches above it, should be cut clean out, so that a clear stem may be secured. These may be planted in the reserve garden at distances of two feet apart each way, and very little attention will be required by them except to keep them free from weeds. If well attended to in this respect, and kept watered in dry weather, they will be in proper condition for forcing in the second or third year.

Lifting should take place early in the month of October, and the plants be at once potted up, using a compost of equal parts loam, leaf-soil, and sand; afterwards the plants may be stood out of doors, and if they are subjected to a few degrees of frost so much the better. Where quantities of lilac are required, a few large plants may be lifted from the open for forcing, and they will be found to yield large numbers of deliciously-scented flowers. They may be lifted and housed as required, merely retaining a good ball of soil and standing the plants on the floor or bed of the house, and working in and about the roots some light compost. Plunging the plants in stable manure and leaves will be found advantageous, provided that these materials be well incorporated and turned two or three times in the open air, to allow the rankness to pass off. Syringings should be frequent, but light, more in the form of a dew than of a thorough drenching, and the floors of the house must be kept damp.

M. Lemoine, of Nancy, has been most successful in the production of many fine lilacs, notably several double forms. Madame Lucie Lemoine is a magnificent variety, bearing long panicles of bouvardia-like white flowers; these are of immense value for cutting purposes. Whether for arranging in vases for the embellishment of rooms, or for bouquets and buttonholes, they are equally effective, and will last a long time. Other good double varieties are Madame Jules Finger, Leon Lemoine, La Tour d'Auvergne, Virginité, and many others, including the purple-flowered rubella plena. Of singles, Charles X. is still one of the best, although there are other varieties which will amply recompense the cultivator for any trouble he may bestow upon them.

Stoneleigh. H. T. MARTIN.

THE AMATEUR QUESTION.

CONCERNING the remarks on the above subject in your issue of the 3rd inst. I cannot accept "the common sense view of things" as set forth. As regards the National Chrysanthemum Society's definition of an amateur I fully appreciate the advice given by Judge Martineau as to "having the rules relating to amateurs amended for the purpose of making them more intelligible." This, no doubt, will now be done. I suggested such an alteration when the schedule for the present year was under revision by the committee appointed for that purpose, but it was not then considered that such alteration was necessary. In your issue of October 29 you say "the ambiguity has arisen in consequence of a want of appreciation on the part of a section of the committee of the fact that all cultivators who do not grow for sale are amateurs." I, as one possessed of this "want of appreciation," cannot accept this, as, despite the "combined wisdom of some fifty or sixty of the most distinguished horticulturists in the United Kingdom," the definition of an amateur as laid down by the National Rose or Dahlia Societies, I submit that no professional gardener (*i e.*, one gaining his livelihood by gardening), or anyone employing a gardener, can rightly be termed an amateur. It is a misnomer that I have contended against for years at annual and other meetings of various societies which I have attended. This is an opinion shared by a large majority of the seven hundred odd members of the National Amateur Gardeners' Association. I also fail to see why you should consider it any injustice to disqualify anyone who, upon giving up possession of his garden, should sell the plants growing in it, or even anyone selling seedlings raised by himself. Both, I maintain, would be strictly trade transactions. In the former case, if he did not choose to take them away with him he could give them away or leave them for his successor; and in the latter he could make an exchange with any nurseryman willing to distribute them. Awaiting further correspondence on the subject,

East Finchley. A. TAYLOR.

Blackened Potatos.—My experience with Chancellor has been similar to that of your correspondent A. D. (page 784, December 3). Grown in the gardens here, in a deeply-dug medium loam, it cooks white and floury, and is of splendid quality. We tried it for two seasons in ploughed land on the farm, some three miles distant, both in a heavy loam and in lighter soil; in each case we had heavy crops of fine tubers, which, on being cooked, turned black, were without flavour and worthless. For this reason we had to discard it. Its parent, Magnum Bonum, and other varieties grown in the same field with Chancellor, produced clear-fleshed tubers, which never blackened.—S. P, *East Anglia.*

APRICOT CULTURE.

IN no former season have apricots produced better crops than in the one just past, when the fruits attained a degree of ripeness and perfection of flavour that will not readily be forgotten. The trees fairly revelled in the great heat, and although this latter entailed the application of a great deal of water to the roots at various times, the outcome of it all is that the trees are in the pink of condition. The wood made is of medium strength; it has ripened up as thoroughly as the most exacting could wish for, and it is also bristling with fruit buds. All this augurs well for the future, and, barring accidents in the shape of severe frosts at the time of the blossoming of the trees, or even after the fruit has set—when they are very susceptible to injury from extreme cold—the future may be looked forward to with hopefulness.

The foliage is now falling fast, which is a reminder that we have arrived at that time of the year when it is the rule to take a survey of the fruit trees generally, with the view of ascertaining what may be required in the shape of new trees to make good any deficiencies. The apricot must, of course, be included; more so, perhaps, than any other fruit tree, as owing to the bad habit it has of losing main branches it is necessary to give constant supervision in this respect if the walls are to be kept well clothed. Neglect of planting means in many instances that in course of time great blanks on apricot walls will occur, which take several years' growth to efface, and much loss of time and crop follows as a natural sequence. The present is also a good time to effect the lifting and transplanting of trees which stand in need of a check owing to their making strong growth. This has the effect of restoring them to fruitfulness, and the remedy is often necessary in the case of apricots planted in soil enriched with manure with well meaning, but mistaken, kindness.

With regard to planting, although I live in a district most favourable to the growth of the apricot, I find it very necessary to plant young trees frequently to provide against contingencies. This I do by putting in maiden trees wherever wall space will allow, and train them myself, when I always have trees to fall back upon in case of a death, or in the event of a tree becoming decrepit or worn out. Trained trees I do not buy unless absolutely compelled to, as they take a whole year in which to recover from the moving, and I find maidens give more satisfactory results. These latter grow away quickly, and frequently form far better trees in one year than purchased trained trees do in two. By growing trees at home in this way the risk arising from loss through lifting is largely minimised, as they but seldom fail, while the lifting and transplanting can always be accomplished earlier in the season than is the case when trees have to be procured from a distance. I find it an excellent plan, before planting new trees, to remove as much of the old soil from the border as can be conveniently done, and without unduly disturbing the roots of adjacent trees. I also take the precaution to have plenty of lime rubble and wood ashes mixed with the new compost. Farm or stable manures we ignore entirely, and when stimulants are required artificial manures are given on the surface during the growing season.

With regard to trees which have made too strong growth from the fact of their having been planted in a too rich compost, the sooner such are lifted and replanted the better taking care at the same time to prevent a recurrence of the evil by replacing the over-rich soil with that of a poorer description, to which calcareous matter has been added. The quantity of the latter that should be used will depend entirely on the nature of the loam, as some soils require very much more than others to keep them open. I find the apricot does best in a compost consisting of two-thirds fairly heavy loam, and the remainder made up of wood ashes, lime rubble, and a fair quantity of brickbats broken small. This should be thoroughly consolidated before the trees are planted by repeated trampings, or even ramming it if necessary. This will prevent gross growth being made; it also ensures the trees coming early into bearing, and the fruits produced by such are always of the best quality. If the lifting and transplanting be properly done in the way of following up and preserving the principal roots and fibres as far as possible, and by laying them out afresh in compost such as has been described, or that of a similar nature, according to the means at command, they should give no further trouble in this direction.

Stoke Edith Gardens. A. WARD.

IS THE ONION SURFACE ROOTING?

WITH regard to this question, perhaps I did not make it quite clear that it was not so much deep digging as deep manuring the lecturer spoke against. Cottagers were advised the onion was only surface rooting, and consequently could not take advantage of manure dug in a spit deep. I am very pleased to find the question has already received replies, and hope other growers will have something to say about this matter. As the question is solely one of onion cultivation, Mr. Riddell's remarks (cultural) prove my contention, viz., that under cultivation the onion is deep rooting. I also observe (*vide* Mr. Riddell) that "food does create roots," at any rate in the case of onions, for it lengthens and multiplies them, and that notwithstanding the bait of bonemeal and sulphate of ammonia used for surface dressings.—S. P.

Under the above heading I perused with interest some remarks in your issue of November 19, page 752, by "S. P.," and, among other things, I noticed my name mentioned in connection with an article I wrote on exhibition onions last spring. All I wish to say now is that I adhere strictly to what I then wrote, and, as the proof of the pudding is in the eating, I shall be most happy to send your correspondent, if you will furnish me with his name and address, a few specimens which were grown precisely under the conditions I then laid down. He will then be able to compare ours with any the lecturer may care to bring forward; and I may mention we experienced one of the most trying seasons I have ever had to contend with as regards drought.—E. BECKETT, *Elstree.*

WORK FOR THE WEEK.

WARM ORCHIDS.

CATTLEYA BOWRINGIANA at the present time will be emitting its young, tender roots, so that if repotting or top-dressing is required it must be attended to. A compost of rough fibrous peat mixed with a few pieces of charcoal and fresh sphagnum moss will suffice, but the plants must be kept well up above the rim of the pot, because the new breaks or growths are produced low down, and thus apt to rot off or in danger of being broken. The work, generally speaking, at this time of the year consists of giving everything a thorough cleansing. There is usually plenty of washing, sponging, &c., to be done, and it is well that all this should be finished while the ordinary course of work is light, for when growth recommences there is very little time for cleaning. Plenty of soft soap and soda will be required to wash down all the stages, rafters, and glass. All the spar or cinders ought to be well washed, so that slugs and woodlice may be killed, and the appearance of this material be made more pleasing.

We have again experienced a change in the weather, and one we do not expect at this time of the year, and are scarcely prepared for. Of late there have been times when we prepared for a night's frost, and when the morning came the rain was falling fast, consequently the houses were warmer than necessary. Great care is required when this occurs, for the following nights may bring cold winds followed by frosts. It is rather puzzling weather for growers I should prefer seasonable weather, so that the plants might take their annual rest and receive as much light as possible. At all times orchids must have a certain amount of humidity in the atmosphere, and if not found naturally such must be provided, according to requirements, by artificial means; a quite dry atmosphere in an orchid house is bad, but excessive moisture is worse.

In many collections several of the phalænopsis will be pushing up their spikes, especially in districts that are clear of fogs; it is wise to put neat stakes to these, and take every precaution to ward off attacks of beetles, slugs, woodlice, &c. But in foggy districts it would be wise to cut away these spikes, and depend upon the second crop of flowers. It is a great pity phalænopsis blooms are so sensitive to fog, for they are extremely useful and beautiful flowers, and must be favourites with all growers. A few plants of dendrobiums must be brought on gently to provide a succession of flowers for general use, as these come in well for buttonholes at the present season.—T. STAFFORD, *Tyntesfield Gardens.*

STOVE PLANTS.

THE present is a suitable time to give the palm house a thorough cleansing. In the first place, tie the palm fronds carefully up so that they be not injured by being stood closely together in one half the house while the other half undergoes a thorough scrubbing with hot soapy water. Cleanse the stages and limewash the walls, then take the palms in hand, giving each a careful sponging to remove any scale or dirt that may be upon them. For cleaning the base of such leaf-blades as Latania borbonica, chamærops, &c., produce, there is nothing better than a good toothbrush, afterwards utilising the syringe to wash out what the brush has loosened. Any potting and top dressing necessary may also be done now, providing the plants so treated are not to be used for room decoration for some time to come. In rearranging the palms, allow each plant the maximum of space to show off its individual beauty, and grow perfectly upright, for a palm whose growth is one-sided is not a desirable object. Any whose pots are full of roots, and are not potted or top-dressed, will require an occasional application of some good artificial fertiliser, with now and again a watering with soot-water to encourage that dark green colour which is such a desideratum. Among those palms most useful from a decorative point of view are Kentia Fosteriana, K. Belmoreana, Latania borbonica, Cocos plumosus, C. Weddeliana, Caryota urens, Phœnix dactylifera, P. rupicola, P. reclinata, Areca lutescens, A. crinita, and Seaforthia elegans. Caryota urens and Seaforthia elegans, though both beautiful and useful subjects, do not bear room treatment so well as the others named, and care must be taken that they are not left in for more than five or six days at a time. All palms, while they are in the rooms, should be kept rather drier at the roots, or the foliage will soon become pale; directly there is the least indication of loss of colour remove them to a warm house, thoroughly cleanse the foliage, and allow them to become quite dry, then stand the pot in a tub of very weak liquid manure for about ten minutes. The soil suitable to the majority of palms during the earlier stages of growth is one part peat, one part loam, and one part good leaf-soil, with a free admixture of sand and a little charcoal. At later pottings the peat may be reduced until, when they are placed into pots of nine-inch diameter and upwards, it may be omitted altogether, excepting for some of the more delicate, such as caryota and cocos.

Nepenthes will now require a position at the warmest and dryest end of the stove and reduced supplies of water, yet taking care that the roots are not allowed to become dry, for, though resting, they require more water than the general run of stove plants in that state. As the bracts are removed from the earlier batches of poinsettias, gradually dry them off and store them away in a dry position in a temperature of 50 to 55 degrees. The later plants are coming on rapidly, and should receive stimulants to develop the bracts to the largest possible size. Reinwardtia tetragyna is now in full beauty, and is amongst the brightest of plants in flower at this season. A position in a moderately dry house with a minimum temperature of 55 degrees suits it admirably when in flower. Urceolinas, as the flowers fade, should be stored away in the intermediate house until the season for repotting and starting into growth comes round again. Encourage gardenias that are required in flower at an early date by judicious applications of stimulants and a free use of the syringe. Pot on young plants of these and ixoras as they fill their pots with roots. Cut down plants of strobilanthus whose leaves have lost their colour, and encourage them to break away from the base, when cuttings can be taken. Keep up a supply of panicum, fittonia, pilea, and selaginella in small pots for furnishing purposes.—J. TUNNINGTON, *Ripley Castle Gardens.*

THE FLOWER GARDEN.

WHERE not already taken in hand herbaceous beds and borders should be cleaned and made as tidy as possible. All dead tops of Michaelmas daisies, solidagos, pæonies, and many others should be cut away close to the ground, and hardy fuchsias of the Riccartoni type may be similarly treated. These latter are useful subjects either for herbaceous or shrubbery borders, and may, if desired, be lifted, divided, and replanted now. During the continuance of mild weather, if the soil be not too wet, any herbaceous subjects that have outgrown their allotted spaces may be reduced or taken up and replanted, discarding the central portion of the clumps, which are often weakly and poor. Borders may also be entirely renovated during open weather by taking short sectional pieces up at a time, trenching, manuring, and replanting each piece and so on, weather permitting, until finished. This is the more easily done where the soil is of a light nature, and besides a saving of time in spring the plants make some roots and partially establish themselves before dry weather is likely to set in. Where other work is not necessary, as above, the borders should be given a surface dressing of half-rotten manure, to remain until the spring, and be then lightly pricked into the surface. Border chrysanthemums may have the tops removed, and unless cuttings are now obtainable a plant or two of each variety should be lifted and placed in cold frames, where protection may be afforded in the event of severe frosts occurring, and from these cuttings may be obtained later for future planting. Those remaining in the borders in permanent positions should be given a slight mulching of cocoa fibre refuse or coal ashes, as should any other subject not quite hardy, as dielytras, alstroemerias, cannas, montbretias, &c.

Herbaceous pæonies, where not freely supplied with water during the past summer, have suffered somewhat from the excessive drought. These strong rooting subjects require good soil and feeding to enable them to produce fine blossoms; large clumps impoverish the soil quickly, and the blooms are small and poor in consequence, and often, especially if dry, the buds fail to develop. Any spare liquid manure may with advantage be poured around the roots even in winter and the surface soil be removed and rotten manure applied, placing the soil back on the top of it. Where the clumps have become over-large they may be dug up now, weather permitting, and divided and replanted elsewhere in well-trenched and manured stations. If required in same positions trench and heavily manure, and add fresh soil about the plants at replanting. Small plants of herbaceous pæonies have little decorative value and take at least two or three years to grow into effective specimens, therefore lifting is not advisable unless the clumps are over-large and partially worn out through exhaustion of the soil.

In shrubbery borders evergreen trees and shrubs, as laurels, hollies, yews, cupressus, &c., may be cut into shape, or with laurels, where large branches have grown tall and lanky, these may be removed by sawing them away close to the ground; work of this description may be done when the ground is too wet to work upon, or even in frosty weather. Prunings of evergreens are often useful for house and church decoration at this season. A considerable amount of labour must of necessity be devoted to the clearing up of fallen leaves from walks, lawns, and pleasure-grounds generally. Leaves should be raked up and carted away without delay, otherwise they may be scattered again by winds. Sweeping should follow the raking, and after this is accomplished both lawns and paths should receive a good rolling if the weather is suitable for the operation. The leaves need not be removed from shrubbery borders in many cases, but be lightly pointed in with flat-tined digging forks. Dirty gravel paths, where regravelling is not necessary, may be easily turned at this season when moist, using forks as above, and turning the gravel over to the depth of two or three inches. New gravel may also be laid on paths providing the weather be fairly dry.—C. HERRIN, *Dropmore Gardens.*

HARDY FRUITS.

THE pruning of bush fruits, gooseberries and currants, will now claim attention. In many gardens birds are troublesome, and it may be well to defer the pruning of gooseberries till the latest possible date; but there are objections to this latter, as the birds frequently take the lower buds needed for next season's fruit. I find it much better to prune at this season, and protect from the enemy. The pruning of young trees should be confined to thinning, opening the centre of the bush room, and removing cross branches. Sucker growths should be cut or pulled clean out from the base, and in all cases the trees will be more shapely if trained to a single stem. In many gardens it may be out of the question to protect with netting; but if this can be done, and wire netting used, it preserves the fruit also. For a wash to preserve the buds I have found fresh lime mixed with quassia extract efficient. Many of our best gooseberries are of pendulous growth, and so it will repay one to give such supports, and in pruning to clear the lower branches from the soil as much as possible. Where the grub was troublesome last year it will be advisable to remove the surface soil from under the trees after the pruning, and replace with new materials; burn the old soil to prevent the spread of the pest. A good coating of fresh lime, sulphur, and soot in a soluble state will prevent moss growth. Gooseberry trees on walls should be attended to. I find we obtain much better fruit if a goodly portion of the weak spurs are removed every third year; this gives the trees a nicer appearance, and the growths, being less crowded, are stronger. At the same time it may be well to encourage new leaders in the case of old trees. Few fruits are more useful than the gooseberry on a north wall, as it is an easy matter to net the trees, and the fruits keep a long time, while the trees give a good return for the space given. Now is a good time to plant cordon gooseberries, using the cream of the dessert kinds, and training them to iron rods or strong stakes. We have now some valuable additions to dessert gooseberries in Langley Beauty, Langley Gage, and Golden Gem, all of which do well in cordon form. All kinds of fruit trees will benefit now by a top-dressing of manure.

Black, white, and red currants should now be pruned, the first by thinning out old wood or weak growth, leaving the well-ripened, strong wood of last season for next year's fruit supply. Many growers leave black currants too crowded, and the fruit are small in consequence. White currants need the same treatment as red, and both these fruit well on spurs or buds which are close to the old stems, so that in pruning it is not necessary to leave a lot of young wood except in the case of young trees needing extension. The shoots may thus be cut close home, only leaving two or three buds from the old wood. In the case of old trees it may be found by this hard pruning that branches are becoming thick and stunted; in such cases it may be well to allow a few new growths to proceed from the base, and in time these will take the place of the older wood. In our locality birds play sad havoc with the currant buds, and we are obliged to protect in the way advised for gooseberries. The black varieties are first attacked, but a dressing of quassia with other mixtures soon repels them; the first-named causes the buds to have a bitter taste. Of late years the black currant has suffered greatly from the mite, and in the case of badly infested trees I have found it advantageous to cut them down to the soil and secure new growths from the base, as half measures are useless.

Plums should now be pruned, and in the case of young trees inclined to be too gross it will be advisable to lift and replant carefully, this being preferable to severe pruning In training young trees on walls these fruits always have a tendency to ascend and grow strong, so now is a good time to lower the branches and equalise the flow of sap. In light soils or gravel the plum fruits none too freely, so if a heavier compost can be given so much the better. Dessert cherries should be pruned and renailed. Morellos also may be taken in hand, but to obtain fine fruits avoid overcrowding. All kinds of fruit trees which root near the surface, such as the cherry, are benefited by a top-dressing of good material at this season; we find burnt refuse and bone-meal an excellent fertiliser. Preparations may now be made for next season's grafting by securing scions of the varieties needed; these should be cut, labelled, and the lower half placed in soil in a cool place, such as under a north wall, and the soil made firm round the wood.—G. WYTHES, *Syon Gardens.*

THOMSON'S

VINE, PLANT, AND VEGETABLE MANURE

INVALUABLE TO ALL CULTIVATORS.

The splendid Grapes produced at Clovenfords for so many years are the result of the judicious application of **Thomson's Manures.** It is splendid also for other Fruit Trees, Plants in Pots, Vegetables, Lawns, &c. It is so combined as to contain all the elements for both stimulating and sustaining.

Sold in Bags and Tins of various sizes. 1 cwt. Carriage Paid to all Stations in the United Kingdom.

ALSO

THOMSON'S SPECIAL TOP-DRESSING MANURE.

To be used as an **additional stimulant** during the growing season for Chrysanthemums and other Plants.

½ cwt. Carriage Paid to all Stations in the United Kingdom. In Bags of various sizes.

Both Manures to be had from most Nurserymen or Seedsmen, or direct from the SOLE Makers—

EXHIBITIONS AND MEETINGS.

NATIONAL ROSE SOCIETY, December 8.

THE annual meeting of this flourishing and ably conducted society was held on the 8th inst. at the Hotel Windsor, by kind permission of the Horticultural Club. The chair was taken by C. E. Shea, Esq., who was supported by the Rev. H. H. d'Ombrain, the Rev. G. E. Jeans, the Rev. J. H. Pemberton, Dr. Shackleton, E. Mawley, O. G. Orpen, G. Bunyard, T. B. Haywood, Conway Jones, C. Cant, R. F. Burnside, J. Burrell, G. Moules, F. Cant, Harcourt Landon, Bateman, J. D. Pawle, etc. Dr. Shackleton and Mr. J. Burrell were appointed scrutineers of the ballot, and then Mr. E. Mawley, one of the hon. secretaries, read the committee's report for 1898:

REPORT OF THE COMMITTEE FOR THE YEAR 1898.

The past year may be regarded as one of steady progress, whether the point of view taken be that of the society's exhibitions, the increase in the number of members, or the issue of its publications.

The most complete arrangements had been made by the society's local representatives—Mr. R. B. Cater, the president of the Bath Floral Fête Committee, and Mr. W. F. Cooling—for the southern exhibition at Bath, but the season unfortunately proved such a very backward one that only exhibitors from the most forward districts were able satisfactorily to compete—in fact, it was, without exception, the smallest show the society has yet held. For the same reason the metropolitan exhibition, which took place at the Crystal Palace a week later, was of rather less than average extent.

If, however, not so large as many of its predecessors, it was certainly one of the best arranged and most enjoyable of recent years. This was principally due to the whole length of the nave having been placed once more at the disposal of the society, and to the new plan of dividing the exhibits in the amateur and trade classes into distinct sections. The best rose show of the year was undoubtedly that at Halifax, where 4,100 blooms of "exhibition" roses alone were staged, making this the most extensive show—with the exception of that at Birmingham in 1890—that has ever been held by the society in the provinces. At all three exhibitions the attendance of visitors was unusually large.

The conferences held in connection with the Bath and Halifax Shows were most successful. Two excellent papers were read, one by Mr. W. F. Cooling, and the other by Mr. G. Paul, followed in each case by an interesting and animated discussion. To the authors of those papers the thanks of the committee are due, as well as to Mr. R. B. Cater and the Venerable Archdeacon Brooke for presiding at the conferences.

The sale of the society's publications during the year has been again very satisfactory, and especially that of the "Hints on Planting Roses." The first edition of these "Hints" having become exhausted, a new and revised edition was printed, and has recently been distributed to the members with the report of the two rose conferences.

It is with deep regret the committee have to record the untimely death of Mr. Rivers H. Langton, one of its members, and a constant exhibitor at the society's exhibitions. A challenge cup, subscribed for to his memory, was offered at the Crystal Palace Show as the first prize in a class in which he himself had so often successfully competed—viz., that for suburban grown roses.

FINANCE.

The committee congratulate the members upon the present satisfactory financial position of the society. The amount in hand at the beginning of the year was £39 18s. 7d., and now at its close there remained £86 16s. 10d. to carry forward to the next account, the total expenditure having been £719 17s. 2d., while the aggregate receipts, including last year's balance, amounted to £806 14s. Although more than the usual number of changes have taken place in the *personnel* of the non-exhibiting members, the amount received in subscriptions has on only three previous occasions been exceeded. This is the more encouraging, as in the Jubilee year of 1897 there was a considerable falling off in this important source of income as compared with the preceding year.

ARRANGEMENTS FOR 1899.

No application having been received from any northern town for the society to visit it in 1899, there will be only two exhibitions next year—a metropolitan and a provincial show. This the committee cannot but regard as rather a fortunate circumstance than otherwise, for had three shows been as usual held it would have been impossible to bring out the new edition of the "Official Catalogue of Exhibition and Garden Roses," which it is proposed should be issued next year, without resorting to the undesirable practice of calling upon the members to contribute to a special fund to defray the cost of its publication.

The metropolitan exhibition will be held, as usual, at the Crystal Palace on the first Saturday in July, while the provincial show will take place at Colchester, in conjunction with the Colchester Rose and Horticultural Society, on the following Thursday, July 6. In order that the early-flowering roses be not altogether overlooked, it has been decided to offer, on June 27, a few prizes at the Royal Horticultural Society's Rose Show, which will be held at their Exhibition Hall in James Street, Westminster.

A committee will shortly be formed to prepare the new edition of the society's official catalogue of exhibition and garden roses, which will be issued to members during the autumn of 1899.

MEMBERS' PRIVILEGES.

Members subscribing £1 will, as usual, be entitled to two private view and four transferable tickets, the latter admitting at the same time as the general public; while subscribers of 10s. are entitled to one private view and two transferable tickets. Each of these tickets is available for any one of the society's exhibitions. Members joining the society for the first time in 1899 will also receive copies of the following publications: The "Official Catalogue of Exhibition and Garden Roses," the supplement to that catalogue, "Hints on Planting Roses," the "Prize Essay on the Hybridisation of Roses," the "Report of the Conferences on Pruning and Exhibiting Roses," as well as the new edition of the official catalogue, as soon as issued. Members alone are allowed to compete at the shows of the society.

The committee tender their hearty thanks to all the donors of special prizes, the competitions for which have contributed so much to the interest and extent of the society's exhibitions, and especially to that at the Crystal Palace. Among these donors may be mentioned the Right Hon. Lord Penzance, the Mayor of Bath, the Venerable Archdeacon Brooke, Mr. C. J. Grahame, and Captain Ramsay. Their thanks are also due to their local secretaries, and especially to Mr. R. B. Cater, of Bath, and Mr. R. Foley Hobbs, of Worcester, through whose exertions a good many new members were obtained for the society during the year; while Mr. G. W. Cook has again done excellent service.

T. B. HAYWOOD, Hon. Treasurer.
J. D. PAWLE,
F. T. WOLLASTON, } Auditors.

A resolution to the effect that the report and financial statement be adopted, printed, and circulated was moved by the Chairman, who considered that the report was one upon which they could congratulate themselves, excepting that two of the 1898 shows were rather smaller ones than usual. He thought, however, the lack of display was amply made up for by the conferences; he was glad to find the society's literature was so much appreciated that the "Hints on Planting" had to go into a further edition. He did not deprecate the lack of one show in 1899—two instead of three—for it enabled the society to be rather more liberal than usual. He was satisfied that the society was ably conducted, and retained the services of its able hon. secretaries, Rev. H. H. d'Ombrain and Mr. E. Mawley. The adoption of the report was seconded by Mr. Frank Cant. The Rev. J. H. Pemberton was sorry that there was to be no northern show in 1899, and considered this somewhat of a misfortune; he even wondered whether the northern rose growers were becoming lukewarm. He thought the N.R.S. should not subsidise other societies. The Rev. H. H. d'Ombrain stated there were only about twenty outstanding subscriptions. With respect to a northern show, he knew of no large amateur rose grower in the north, and that was the reason why no invitation had been received for a northern provincial exhibition in 1898.

Mr. A. Foley Hobbs proposed, and Mr. F. W. Campion seconded the proposition, "That the thanks of the society be given to the officers and other members of the committee for their services during the year." This was carried, and responded to by the Rev. H. H. d'Ombrain, who eulogised Mr. Mawley's efforts with regard to the conferences.

Mr. George Paul proposed a new regulation, as follows: "In the three trophy classes at the metropolitan exhibition, and in the two trophy classes at the provincial exhibition, the blooms must be staged in boxes of the following dimensions, viz.: Twenty-four blooms in boxes 3 ft. 6 in. long by 1 ft. 6 in. wide, and eighteen blooms in boxes 2 ft. 9 in. long by 1 ft. 6 in. wide, all outside measurements." This regulation, he said, needed little explanation, as it made a provision by which all competitors in trophy classes mentioned should compete on an equality as regards the spacing of the blooms. Mr. Frank Cant seconded the proposition, considering it also enabled the blooms to be staged so that their labels could be distinctly read by visitors. The Rev. J. H. Pemberton could not agree entirely with the proposed new regulation, as he objected to anything that would appear as if the society did not know its own mind with respect to the size of boxes. He therefore proposed as an amendment that Rule 18 should read: "Exhibition stands should be of the regulation size, namely, four inches high in front and not more than eighteen inches wide, and be set out with moss or other suitable material. They should also be of an uniform length, namely: For twenty-four blooms, not less than 3 ft., nor more than 3 ft. 6 in.; for eighteen blooms, not less than 2 ft. 9 in., nor more than 3 ft.; for twelve blooms, not less than 1 ft. 6 in., nor more than 2 ft.; for six or nine blooms, not less than 1 ft., nor more than 1 ft. 6 in." In addition to this, he proposed that the new regulation should read: "In the three trophy classes at the metropolitan exhibition and in the two trophy classes at the provincial exhibition the blooms must be staged in boxes of the regulation size as set forth in Regulation 18 as amended." Messrs. Mawley, F. Cant, C. Cant, and O. G. Orpen took part in the discussion that followed, Mr. Orpen rather objecting to the mathematical precision proposed for the sizes of show boxes. Mr. G. Paul thought an error of a quarter of an inch should not disqualify, but an error of an inch he would consider a wilful infringement of the regulation, and deserving of disqualification. The Chairman pointed out that such small deviations from the proposed fixed sizes as one-eighth or one-quarter of an inch would not necessarily be wilful digression, and would doubtless be treated by the judges in a common-sense manner. After a little more discussion the amendment was put, with the result that ten voted for and eighteen against it. Mr. Pemberton was desirous of bringing forward another amendment, but this was not considered convenient. The proposal of Mr. G. Paul was then put to the meeting, and carried by nineteen votes against five. The committee was given power to add a notice that other sizes than those fixed would disqualify a competitor.

Mr. Landon expressed his dissatisfaction with the new regulation as passed, and proposed that the committee insert a notice in the forthcoming schedule to the effect that the new regulation and fixed sizes for show boxes were experimental, and the experiment was being made with a view to eventually fixing sizes for boxes throughout the competitions of the N.R.S. This suggestion, together with one that the committee shall meet and thoroughly consider the question of uniformity of size in show boxes for roses, was agreed to.

The scrutineers stated that the house list of officers had been accepted. The Hon. Secretary gave out that the Southern Provincial Show of 1900 would be held at Salisbury, and probably the northern one at Birmingham, but this was not settled; the metropolitan show would be held at the Crystal Palace as usual.

On the proposal of the Rev. G. E. Jeans a hearty vote of thanks was accorded the chairman for his services.

The annual dinner of the society was held later in the evening, under the presidency of R. B. Cater, Esq. The proceedings throughout were of the most enjoyable nature, the dinner being followed by speeches from the Chairman, Rev. H. H. d'Ombrain, Mr. E. Mawley, Mr. G. Bunyard, V.M.H., Mr. G. Paul, V.M.H., Mr. O. G. Orpen, Mr. J. Collingridge, and Mr. George Gordon, V.M.H. The musical arrangements were in the hands of Mr. J. D. Pawle, and gave every satisfaction.

ROYAL HORTICULTURAL SOCIETY, December 13.

THERE was a very pretty and interesting exhibition on the above date at the Drill Hall, and it formed a fitting conclusion to the splendid series that have marked the progress and popularity of the society during the present year. Orchids and winter-flowering begonias were especially good.

FLORAL COMMITTEE.

Mr. W. J. Prewett, gardener to C. A. Pearson, Esq., Frensham Place, Farnham, showed a goodly group of heaths and Begonia Gloire de Lorraine associated with Dracæna Sanderiana, D. Godseffiana, and a few cypripediums; silver Banksian medal. The value of Acalypha hispida (Sanderi) for winter decoration was admirably demonstrated on this occasion by Messrs. F. Sander and Co., St. Albans, who showed a number of good specimens carrying numbers of the long and vivid crimson tails which showed up splendidly in the half light in the Drill Hall; other introductions of this firm were on view, including Acalypha Godseffiana and Licuala Jeanenceyi; silver Banksian medal. A magnificent exhibit of Begonia Gloire de Lorraine was put up by Mr. H. B. May, Edmonton, who occupied half a long table with forty fine specimens in forty-eight's, thirty-two's, and twenty-four-sized pots; the largest were two and a-half feet through and beautiful plants; these begonias were associated with adiantum and other ferns, and Asparagus Sprengeri, the combination affording an opportunity of noting how useful is this begonia for winter decoration; silver-gilt Banksian medal.

Chrysanthemums in considerable variety were staged in bunches by Mr. W. Wells, Earlswood, Surrey; this was a bright exhibit, and the varieties staged most freely were Madame P. Rivoire, Mrs. C. Bown, Monsieur Viellard, Julia Scaramanga, Georgina Pitcher, Lucy A. Thomson, soft yellow, a useful late variety, and a sport from Silver Cloud; Beauty of Sholing, Redhill Beauty, Mrs. W. Butters, and Sunset; there was a handsome set of late-flowering kinds; silver Banksian medal. Messrs. H. Cannell and Sons, Swanley, Kent, had a brilliant exhibit of zonal pelargoniums, cut blooms arranged in big sprays; some of the most effective and warmly coloured of these large-bloomed forms were W. E. Cordon, Rudyard Kipling, King of Crimsons, Nicholas II., Lord Reay, A. Tennyson, Lord Farrer, Countess de Morella, The Sirdar, a grand new form with immense deep scarlet flowers; and Hall Caine; silver gilt Banksian medal. Mr. H. Eckford, Wem, Salop, sent four varieties of single-flowered primulas, remarkable chiefly for their excessive frilling and fringing and the graduation of the colouring in some forms, notably in Isa Eckford, where the orange-centre shades to the vivid red-rose margin.

Messrs. J. Veitch and Sons, Chelsea, showed a very bright group of the winter-flowering begonias raised by Mr. Heal at the Chelsea Nursery; these included Myra, the very bright and semi double Winter Cheer; Success, a double pink; Ensign, semi-double, carmine. All were flowering with the utmost freedom, carrying their flowers on graceful sprays well above the bold green foliage. Silver Flora medal. Mr. Empson, Ampthill House gardens, sent a specimen of the bright-flowered Plumbago rosea, a species not sufficiently grown for winter effect. Mr. Kingsmill, Harrow, showed a flower of Aristolochia ornithocephala. Mr. W. J. Godfrey, Exmouth, showed Christmas Favourite, white, and Queen of Pinks, two late Japanese chrysanthemums; Winter White was also shown, but unfortunately all the flowers had had their necks broken in transit.

ORCHID COMMITTEE.

A really fine display of orchids was made on this date, the amateur and trade growers coming out well with tasteful groups. Mr. W. H. White, grower to Sir Trevor Lawrence, Bart., Burford Lodge, Dorking, staged a beautiful lot of calanthes, all representing excellent culture; the principal forms were Calanthe revertens, C. Veitchi, C. V. lactea, C. Burfordiense, very brilliant, C. bella, C. versicolor, C. amabilis, C. Victoria Regina, and C. Veitchi splendens; Mr. White also showed fine plants of Cypripedium Leeanum in variety; silver Flora medal. Messrs. F. Sander and Co., St. Albans, put up a small group of orchids, the sprays of Oncidium varicosum Rogersi brightening up the specimens of Cypripedium Leeanum giganteum, C. L. superbum, C. L. magnificum, C. Tityrus, C. Albert Hye, and others.

From Messrs. J. Veitch and Sons, Chelsea, came an interesting collection, in which Cymbidium Traceyanum was most conspicuous and a good form; Cypripedium insigne Sanderæ with two fine blooms, C. insigne Chantini, C. Niobe, C. Leeanum, C. Arthurianum pulchellum, Masdevallia Imogen, Oncidium dasystyle, Dendrobium atro-purpureum, D. bracteosum album, Ionopsis paniculata, Epidendrum Edresio-Wallisi, and Lælia Novelty were all represented by neat flowering specimens, making together a pretty display that gained a silver Flora medal. Messrs. Hugh Low and Co. contributed a pretty set of orchids, the specimens of Cattleya Dowiana, C. crispa, Cypripedium insigne Laura Kimball, C. Leeanum in variety, Sophronitis grandiflora, Cymbidium Traceyanum superbum, a finely coloured variety, Oncidium tigrinum, O. crispum, &c., were all well represented and tastefully set up with ferns; silver Banksian medal.

Mr. H. J. Chapman, orchid grower to R. I. Measures, Esq., Cambridge Lodge, Camberwell, showed a first rate collection of cypripediums, together with a few other interesting orchids, such as Vanda Kimballiana, Sophronitis grandiflora, Oncidium cheirophorum, &c. Among the cypripediums we noted good flowering plants of C. Wottoni, C. Allanianum, C. insigne Sanderæ, C. Leeanum, C. Chamberlainianum, C. insigne Ernesti, C. Io-grande, and C. Niobe among other notable forms; silver Flora medal. Mr. A, Howard, gardener to H. Little, Esq., Baronshalt, Twickenham, sent examples of the more popular cypripediums, together with a three flowered spike of C Stonei, Lælia autumnalis, Vanda cærulea, and Dendrobium formosum giganteum; bronze Banksian medal.

Mr. Holbrook, gardener to E. Ashworth, Esq., Wilmslow, staged a fine specimen of Cypripedium insigne, Harefield Hall var., carrying bold blooms that are well marked, and of immense size. Mr. G. Cragg, gardener to W. C. Walker, Esq., Winchmore Hill, sent a remarkably well-flowered Dendrobium aureum, sweetly fragrant. A collection of cypripedium blooms came from Captain Holford, Westonbirt, Gloucester. Unfortunately the flowers were badly staged, being crowded eight or nine blooms together in the earthen vases. To send such fine blooms and then not stage them tastefully seems to us to be an unfortunate mistake. A silver Banksian medal was awarded. Sir W. Marriott, Blandford, sent a fine flower of Cattleya Mendeli crossed C. gigas.

The Chelsea firm showed several fine hybrid orchids, notably Lælio-cattleya Frederick Boyle, a hybrid in which Lælia anceps and Cattleya Trianæ are very evident; Lælia Omen, a eross between L. autumnalis and L. purpurata, very distinct; L. Digbyana-purpurata, a cross between the species noted, but one in which L. Digbyana is not very evident, save in the growth; Lælio Cattleya Andreana var. Agnes, the result of crossing L. elegans and C. bicolor. Mr. H. A. Burberry showed a very pretty and dark-lipped Lælia anceps, named Burberryanum; it is a handsome large-flowered variety.

FRUIT AND VEGETABLE COMMITTEE.

Mr. C. Ross, Welfork Park, showed an apple named Paroquet, and Mr. A. Dean sent a dish of brightly-coloured fruits of Hoary Morning. Mr. W. Shingler, Melton Constable, sent a seedling grape, the result of a cross between Lady Hastings and Gros Colmar.

SCOTTISH HORTICULTURAL ASSOCIATION.

THE last meeting of this year has been held, and there was a good attendance, some score of new members being proposed. The president, Mr. Todd, showed a handsome vase, some eighteen inches high, with a base of smilax, furnished with fine chrysanthemums, produced, as he explained, with few of the luxuries of superior culture, just having such rough and ready treatment as any amateur grower could afford. We noticed the following blooms set off with a grass, something between a big Briza major, and called Elephant Grass: Viviand Morel, W. H. Lincoln, Yellow La Triomphante, Souvenir de Petite Aimée Mr. Jones sent a box of friends and foes of the chrysanthemum, which most growers seemed shy to open, for fear any of them should make good their escape, and Mr. Cooke showed a nice plant of Lilias with six blooms in a six-inch pot, stating that it was inserted as a cutting at the end of last March, and that many sorts could be grown successfully in six-inch pots.

The secretary, Mr. Robert Laird, then proceeded to read a paper by Mr. A. Wright, Falkland Park, South Norwood, Surrey, on the arrangement of hardy plants in the garden. The author of the paper, to the apparent surprise of the society, dealt with the question under the three heads of trees, shrubs, and hardy herbaceous and alpine plants. In each class he recommended grouping as the best means of brightening the effect. Plants of the same genera mostly go well together. The grouping of trees was often passed over because of its difficulties, and also owing to the fact that the planter seldom lived to see the full effects or results of his work. This was doubtless the reason why so little was done to develop to the full the landscape effects of trees. Deciduous trees should not be too near the house, because of the litter of their falling leaves, a gardener's, and not an artist's, reason. Foregrounds of evergreens, including conifers as recommended by Mr. Wright, are by no means always best. Thorns, laburnums, apples, cherries, crabs, chestnuts, green and purple beeches, birches, silver poplars, golden or other variegated planes, and many other trees often give far greater light and variety to our lawns and gardens. Mr. Wright hastened on to shrubs as more manageable and sooner grown into artistic groups. The great danger here, as among herbaceous plants, was formality of beds and borders. The less of this the better. Such shrubs as rhododendrons, azaleas, berberis seemed made for grouping, and, indeed, the same might be said of most of our other choice shrubs—deciduous and evergreens. Finally, as to our herbaceous and alpine plants, we had a group worthy of all the attention that could be brought to bear upon it. Year by year they were taking a more prominent place among their best hardy neighbours. Few who knew their great wealth of beauty but would admit that this was a change in the right direction. The place for herbaceous plants, &c., was in front of the shrubbery, a place hardly endorsed by several speakers, who contended that the herbaceous plants and alpines would certainly object to the roots of the trees and shrubs underground, and their shade trees and shrubs overhead.

After an animated discussion—in which the following took part, Messrs. Long, James Grieve, Comfort, Frazer, Fish, Johnstone, Mackenzie, and the President—the latter proposed a vote of thanks to Mr. Wright for his paper, which was heartily passed, for though it had elicited considerable variety of opinion all agreed that the paper had provided useful pegs for discussion. One of the most interesting facts elicited by this discussion was stated by Mr. Mackenzie, to the effect that there was nothing new in the grouping of plants for effect. All our chief gardens are planted on the grouping system, and the great Loudon, when in his prime, submitted a plan to the Town Council of Edinburgh to cover Arthur's Seat with groups of trees and flowering shrubs, such as rhododendrons, &c. The treasurer presented an epitome of the takings at the last chrysanthemum show, which showed a balance of £209 over expenditure.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.

AT a meeting held the other day of those directors of the above society who were associated with Mr. Duncan M. Smith during his vice-chairmanship of the society a resolution was proposed, and unanimously adopted, that it would be a fitting and courteous thing to recognise in some way Mr. Smith's long and untiring services to the society—services so onerous and valuable as to well deserve some recognition, not only by the directors who were associated with Mr. Smith, but also by the members of the society generally. This resolution was carried out on Wednesday evening, 7th inst., when Mr. Smith was entertained at dinner in the Imperial Hotel, Aberdeen. There was a large and representative gathering, and Mr. William Pyper, of Hillhead, president of the society, occupied the chair. After dinner the loyal toasts were proposed and very heartily responded to.

In proposing the toast of "The Guest of the Evening," the Chairman said they were there that night to do honour to a gentleman whom they had known for the last twenty years, and who had been connected with the Royal Horticultural Society of Aberdeen beyond that period. The purpose of their meeting that night was to convey their indebtedness to Mr. Smith for the services he had rendered to the society. Their guest had had a great deal to do with the building up of the society and getting it into the position it was at the present time. They were sorry to lose such an official as Mr. Smith. Although Mr. Smith was not now an official of the society, he was still a member, and as a member they would find him doing noble and honourable work as in the past.

The toast was most enthusiastically responded to, and Mr. Smith in reply said he was deeply sensible of the great honour they had done him that night, but he could not bring himself to think that the services he had performed to the society were worthy of so great a reward. He was proud indeed that he had won the respect and esteem of many of the gentlemen he saw that evening. Mr. Smith then gave many pleasant reminiscences of his connection with the society, and in conclusion bespoke the hearty support and encouragement of all classes of the community on behalf of the society, and declared that, although he was retiring from active duty, he should ever retain a warm corner in his heart for the Royal Horticultural Society of Aberdeen.

Mr. J. S. Bulchart, advocate, proposed "The Society," and the Chairman in reply said it had been in existence for seventy-four years. Its membership was about five hundred, the reserve fund amounted to £200, and they had H.R.H. the Prince of Wales as their patron.

NEW PLANTS AND FLOWERS.

Cypripedium insigne, Harefield Hall var.

This is one of the very largest forms of C. insigne yet brought under our notice. The plant is robust, and carried six blooms, each measuring four and a-half inches from the tip of the dorsal sepal to the apex of the lip, and four and three-quarter inches across the petals. The dorsal sepal is almost three inches broad, and has a very broad white apex, the white area extending some way down the sides; the basal area is very pale, transparent, and yellowish-green, over which is strewn a large number of big purple spots, a few of these extending upward into the white apex. The petals are wholly pale-green, with a few darker veins; lips large and full, pale-green, with dark-green veins; ventral sepal, very pale-green, with a few purple dots; peduncle rich and blackish-purple. F.C.C., R.H.S., December 13. Mr. E. Ashworth, Harefield Hall, Wilmslow.

Lælia Digbyano-purpurata.

A handsome orchid, whose parents are L. Digbyana and L. purpurata. The flowers are very large, and resemble a fine form of L. purpurata. The sepals are narrow, faintly blush-tinged on a white ground. Petals broad, white, with rosy-purple streaks at the margins. Lip very broad at the apex, rich purple, margined with paler purple. Throat yellow, tube cream coloured. There is not much evidence of L. Digbyana in the flower, but this species has dwarfed the habit of the plant and modified the growths and foliage. A.M., R.H.S., December 13. Messrs. J. Veitch and Sons, Chelsea.

Calanthe revertens.

A handsome calanthe, producing its flowers rather closely together on the spikes. The colour is intense rosy-red, almost approaching a scarlet shade, and very effective. The usefulness of this gay orchid can scarcely be exaggerated. A.M., R.H.S., December 13. Mr. White, orchid grower to Sir Trevor Lawrence, Bart., Dorking.

Asparagus Sprengeri compacta.

This is a most distinct form of a now well-known species, producing shorter growths, on which the leaves (phyllodes) are larger than in the type, and placed closely together. It is a graceful basket plant, and one of great beauty and usefulness. F.C.C., R.H.S., December 13. Mr. H. B. May, Edmonton.

The Rochford Tubular Boilers, as supplied by Messrs. C. P. Kinnell and Co., Southwark Street, S.E., are becoming increasingly popular owing to their simplicity, the ease with which they are managed, and their quick-heating power. Messrs. Keynes, Williams, and Co. have recently erected a considerable number of new glass houses at their East Farnham nursery, and these are being satisfactorily heated by double sets of Rochford tubular boilers, so fixed that each boiler can be readily disconnected for cleaning and repairing, or during warm weather, when but one boiler in each pair is needed to provide the requisite temperature.

Market Gardeners' Rights at Covent Garden.—A short time ago several market gardeners trading at Covent Garden sued the Duke of Bedford, as owner of Covent Garden, on behalf of themselves and all other growers of fruit, flowers, and vegetables, for a declaration that he was not entitled to exclude them from certain preferential rights as to stands conferred by the Act for the Regulation of Covent Garden Market (9. Geo. IV., cap. cxiii.), and they also claimed consequential relief. The defendant applied to set aside the proceedings on the grounds that the plaintiffs, as having separate and distinct causes of action, could not join, and also could not, as private individuals, sue on behalf of a class of the public, *i.e.*, growers of fruit, flowers, vegetables, &c., in respect of public or other statutory rights. Judgment was deferred until the 7th inst., when Mr. Justice Romer said that the first point was to consider whether the plaintiffs were entitled to sue on behalf of themselves and all other growers of fruit, flowers, vegetables, roots, or herbs within the meaning of the Act (9 Geo. IV., cap. cxiii.). Now, as pointed out in "Temperton v. Russell" (*L.R.*, 1893, 1 Q.B., 435), Order XVI, rule 9, which provides for persons suing or being sued as representing a class, only extends to cases where the class have or claim some beneficial proprietary right which is being asserted or defended. He had, therefore, to consider whether the growers in question as a class have a beneficial proprietary right under the above Act which is being asserted in this action. On consideration of the provisions of that Act in favour of the growers with regard to Covent Garden Market, he was unable to come to the conclusion that the growers as a class have any proprietary rights in respect of the market. All members of the public have a right to go to and use the market, and it appeared to him that, by the Act, all that in substance is provided is that those members of the public coming to use the market who are growers shall have preference over the rest of the public in taking and having let to them certain parts of the market. Of course, if any individual grower had let to him under the Act a part of the market he would, during the letting and in respect of the part let, have a proprietary right. But he could not see that growers as a class can be said to have a proprietary right in respect of the market merely because if any member of the class chooses to go to and use the market he can claim to be preferred over an outside member of the public in taking or having let to him a portion of certain specified parts of the market. He considered that such right as the growers as a class have under the Act is in the nature of a public right, which must be enforced when necessary by the Attorney-General. Of course any member of the class who has been injured by the provisions of the Act being disregarded will have his remedy in respect of his own individual injury. But where the complaint is that the rights of the growers as a class have been disregarded and relief is sought on behalf of the class by way of declaration of right or injunction then he thought, the Attorney-General is the proper person to sue.

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, &c., for reproduction in the Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning change of dates.

Crinodendron Hookerianum.—B. C., Ryde: The correct name of this Chilian shrub is Tricuspidaria hexapetala. You might apply to Mr. William Bull, 536, King's Road, Chelsea.

Rustic Adornments.—S. L., Forest Hill: We believe "Rustic Adornments for Homes of Taste" will suit you exactly, for besides treating upon summer houses, garden seats, rockeries, ferneries, and window boxes it deals with floral decorations, balcony gardening, and garden aquaria, also giving advice concerning pleasure and flower gardening and the management of an amateur's green house and conservatory. The work is published by Messrs. W. H. and L. Collingridge, 148 and 149, Aldersgate Street, E.C., price 6s.

Half-inch Bones for Roses.—E. L. M., Surrey: We recommend quarter-inch bones for mixing with the soil in the preparation of rose beds, rather than those of larger size. As the ground has already been well prepared by digging and trenching, it will perhaps be the best plan to apply the bones when planting the roses, giving a good handful to each station. These prepared bones can be readily obtained through any of the horticultural sundriesmen who advertise in our columns or through most nurserymen. Plant the roses as quickly as possible; if they seem very dry on receipt, put them in a tank of water for an hour or two before planting. Be careful not to make the soil pasty by too much treading upon it during the present wet weather, and though it may not be too wet for planting, you will save much trouble later by using a few planks to walk or wheel upon.

Woodlice, or "Slaters."—M. B., Glasgow: We believe the pests you allude to as "slaters" are what are known throughout the southern counties as woodlice (*Oniscus asellus*). If allowed to remain and multiply in your rock fernery under glass they will do an immense amount of damage next spring when growth commences. There are various means by which woodlice can be exterminated, or, at least, so reduced as to be almost harmless, but persistent efforts are needed in every case, coupled with patience. Select a few dry and dirty flower-pots, the dirtier the better, and into these place some dry, but also dirty, moss; then place these traps where the woodlice congregate. Early in the morning, or late at night, provide yourself with a pan of boiling water or strong brine, and into this quickly shoot the contents of the pots, taking care no woodlice are left behind. The moss may be subsequently dried and used again and again. Shift the traps occasionally, and after a fortnight's trapping there should be few woodlice left. Raw potatos, halved and scooped hollow, also serve as traps, and are very useful in the case of plants in pots. Dusk and dawn are the best times to examine the traps.

Autumn and Winter Berries.—T. M., Winchester: The following list, if not a complete one, is probably quite as extensive as you could wish, and it will serve to show what a wealth of berried subjects is available during autumn and winter. Not all those mentioned are still in condition, but a considerable number could be obtained in southern gardens and utilised for Christmas and other decorations: Cratægus prunifolia, C. orientalis, C. o. sanguinea, C. punctata splendens, C. cordata, C. coccinea, C. oxycantha, C. melanocarpa, C. pyracantha, C. Leelandi, C. glandulosa, C. tomentosa, Hippophœa rhamnoides, Gleditchia triacanthos, Pernettya mucronata, P. m. speciosa, P. m. angustifolia, Arbutus procera, A. Unedo, Cotoneaster affinis, C. frigida, C. horizontalis, C. microphylla, C. Simonsi, C. bacillaris, C. buxifolia, Berberis asiatica, B. vulgaris, Rosa rubiginosa, R. simplex, R. canina, R. rugosa, in variety; Magnolia purpurea, Viburnum rugosum, V. opulus, Skimmia japonica, S. j. fragrans, Pyrus floribunda, P. malus nigra, P. Bertini, P. salvifolia, P. Ringo, P. terminalis, Hypericum androssemum, H. pyramidatum, Rhamnus cathartica, Euonymus europæus, E. e. fructo-alba, Trochodendron aralioides, Cornus sanguinea atro-sanguinea, Symphonicarpus racemosus, Ilex Perado, I. aquifolium vars., Styrax obbassa, S. japonica, Rhamnus fragula, R. f. variegata, Hedera arborea chrysophylla, Laurus nobilis, Alnus pendula Van der Bom, A. cordifolia, Cerasus Lauro-cerasus, Leycesteria formosa, Quercus Ilex, and Xanthocerus sorbifolia. The common privet also provides fine clusters of black berries that are finely decorative and the honeysuckle yields red ones. Apart from hardy trees and shrubs there are Physalis Alkekengi, P. Franchetti; the open pods of the wild iris, with scarlet berries; and then also such tender subjects as the capsicums, Solanum capsicastrum, Ardisia crenulata, Callicarpa purpurea, and Rivina humilis. The late and long-continued summer of the present year ripened up the fruits of hardy passifloras freely in the southern counties, and these could be utilised with considerable effect.

Names of Plants.—Under this heading we can only undertake to name species and specific varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp moss or leaves as packing material to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that the numbers be legible and firmly attached to the specimens. We cannot promise to name more than six specimens at one time from any one correspondent.

C. H., Roehampton: 1, Linum trigynum; 2, Poinsettia pulcherrima; 3, Euphorbia jacquinæflora.

L. T. G., Sheffield: 1, Maxillaria picta; 2, Didymochlæna lunulata; 3, Gymnogramma Mayi; 4, Nephrolepis Bausei; 5, Symphoricarpus racemosus.

W. R., Leicester: 1, Erica hyemalis; 2, Araucaria excelsa; 3, Nephrodium molle corymbiferum; 4, Pteris longifolia; 5, an ordinary form of Cypripedium insigne; 6, Cœlogyne (Pleione) lagenaria.

H. E., Nottingham: 1, Polystichum angulare proliferum; 2, a selaginella, but too shrivelled to be recognised; 3, Selaginella Wildenovi; 4, Hippeastrum reticulatum; 5, send when in flower; 6, Bambusa Fortunei variegata.

Names of Fruits.—We are pleased to assist our readers as far as it is possible to do so in naming fruits, but it is absolutely necessary that they should send us good specimens carefully packed, as it is only when characteristic examples reach us in perfect condition that we are able to determine their names. We are compelled to insist on the observance of this rule, as so many specimens now reach us. We cannot undertake to name more than six varieties at one time; and both apples and pears should be sent when approaching maturity, but before they are fully ripe, that we may have the assistance of their distinctive colours in determining their identity.

B. W. E., Ipswich: 1, Mère de Ménage; 2, King of the Pippins; 3, Baumann's Red Winter Reinette; 4, Minchull Crab.

R. F., Windsor: Nottingham Medlar.

P. P., Berkhamsted: 1, Alfriston; 2, Ribston Pippin; 3, Dumelow's Seedling.

A. D. J., Bideford: 1, Blenheim Pippin; 2, Dr. Harvey; 3, Cellini.

S. R. M., Gloucester: 1, Glout Morceau; 2, Easter Beurre; 3, Vicar of Winkfield; 4, Catillac.

O. G., Warwick: 1, Egremont Russet; 2, Fearns Pippin.

The mean reading of the Barometer during the week at Greenwich was 29·82 inches, and that of the Thermometer 49°·4, the latter being 8°·6 above the week's average in the 50 years 1841—90. The direction of the wind was south-westerly, the horizontal movement of the air being 46 per cent. above the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 6·7 hours. The measured rainfall amounted to 1·34 of an inch.

MARKETS.

Covent Garden.

THERE is now a steadily increasing demand for all kinds of produce. Supplies of fruits and vegetables are fairly large, though there is not an abundance of high-class green stuffs. Oranges, grapes, apples, and nuts sell readily. The potato trade is fairly good, and the cut flower trade brisk.

FRUIT.—English apples, 3s. to 9s. per bushel; Nova Scotian and Canadian, 10s. to 22s. per barrel; Californian, 7s. to 9s. per case; French pears, 3s. to 5s. per case; Californian, 4s. to 7s. per half-case; English grapes, 10d. to 1s. 9d.; Channel Islands, 6d. to 1s. per lb.; Almeria, 10s. to 18s. per barrel; Jaffa oranges, 7s. to 10s. per box; Valencia, 8s. to 16s.; Murcia, 6s. to 6s. 6d. per case; pineapples, 1s. 6d. to 4s. 6d. each; bananas, 4s. to 9s. per bunch; lemons, 8s. to 16s. per case; English tomatos, 6s. per 12 lb.; Bordeaux, 1s. 6d. to 2s. per box.

FLOWERS.—Arums, 8s. to 12s.; carnations, 2s. to 6s.; chrysanthemums, white and yellow, 1s. to 4s.; eucharis, 3s. to 6s.; gardenias, 1s. 6d. to 3s.; Lilium Harrisi, 8s. to 12s.; tea roses, 1s. to 2s.; pink roses, 3s. to 6s.; cattleyas, 6s. to 12s.; Odontoglossum crispum, 2s. to 6s.; and tuberoses, 4d. to 9d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; chrysanthemums, 6s. to 9s.; marguerites, 3s. to 6s.; mignonette, 2s. to 4s.; pelargoniums (scarlet), 6s. to 12s. per dozen bunches; lily of the valley, 1s. to 2s. 6d.: Roman hyacinths, 1s. to 1s. 6d.; pelargoniums, 6d. to 1s. per dozen sprays; and bouvardias, 4d. to 8d. per bunch.

VEGETABLES.—English onions, 5s. to 5s. 6d. per cwt.; Valencia, 6s. per case; Dutch, 3s. 3d. to 3s. 9d. per bag; eschallots, 8s. to 10s. per cwt.; cucumbers, 2s. 6d. to 4s. 6d.; endive, 1s. 3d. to 1s. 9d.; lettuce, 9d. to 1s.; cos, 2s. to 2s. 6d. per dozen; cabbages, 3s. 6d. to 6s.; cauliflowers, 6s. to 9s. per tally; celery, 6s. to 12s. per dozen rolls; Brussels sprouts, 2s. 6d. to 3s. per half-sieve; spinach, 2s. to 2s. 6d. per bushel; seakale, 9d. to 1s. per punnet; mushrooms, 8s.; garlic, 3s. per 12 lb.

Borough Potato Market.

There is a moderate trade at recent rates, the late and large supplies having kept prices down. Scottish Abundance, Bruce, and Main Crop, 65s. to 70s.; Beauty of Hebron, Snowdrop, and Up to Date, 70s. to 75s.; White Hebron, Early Puritan, Bruce Magnum, Sutton's Early Regent, Reading Giant, and Imperator, 60s. to 65s.; Blacklands, 60s. per ton; Germans, 2s. 9d. per bag.

ENGAGEMENTS FOR THE ENSUING WEEK.

MEETINGS.

MONDAY, DECEMBER 19.—National Chrysanthemum Society: General Committee Meeting.

AUCTIONS.

MONDAY, TUESDAY, WEDNESDAY, DECEMBER 19, 20, AND 21.—Dutch Bulbs, Hyacinths, Lilies, Brazilian Orchids, Cattleyas, Cypripediums, Lilium Auratum, &c., Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.

COMMERCE, WITH ITS SPREADING WINGS, has traversed the globe many times, and binds nations together with the strong ties of mutual self-interest. Through its influence London has become the metropolis of the world, and her merchants have amassed wealth sufficient to make them the envy of princes. Holloway's Pills and Ointment have now become essential articles of commerce with all parts of the world. They have effected cures which have seemed miraculous, and given relief in complaints when all hope had been lost. In all known diseases their success has at all times been wonderful. In cases of disorders of the stomach, bile, liver complaint, indigestion, fevers, ague, &c., they act like a charm, as the cure is speedy and certain.—[ADVT.]

FROM ALL NURSERYMEN, SEEDSMEN, & FLORISTS.

G. H. RICHARDS, Manufacturer & Patentee, 124, SOUTHWARK STREET, LONDON, S.E.
Telegraphic Address: "VAPORIZING, LONDON."

CANARY GUANO
FOR GREENHOUSE & GARDEN
THE BEST IN THE WORLD.
TINS, 6d and 1s each. BAGS, 14 lb. 4/6; 28-lb. 7/6; 56-lb. 12/6; 1 cwt. 20/ each.
FULL DIRECTIONS FOR USE ON EACH TIN.
Perfectly Clean—May be used by a Lady.
Retail of all Seedsmen, Nurserymen, and Florists.
Wholesale of—THE CHEMICAL UNION, LTD., IPSWICH.

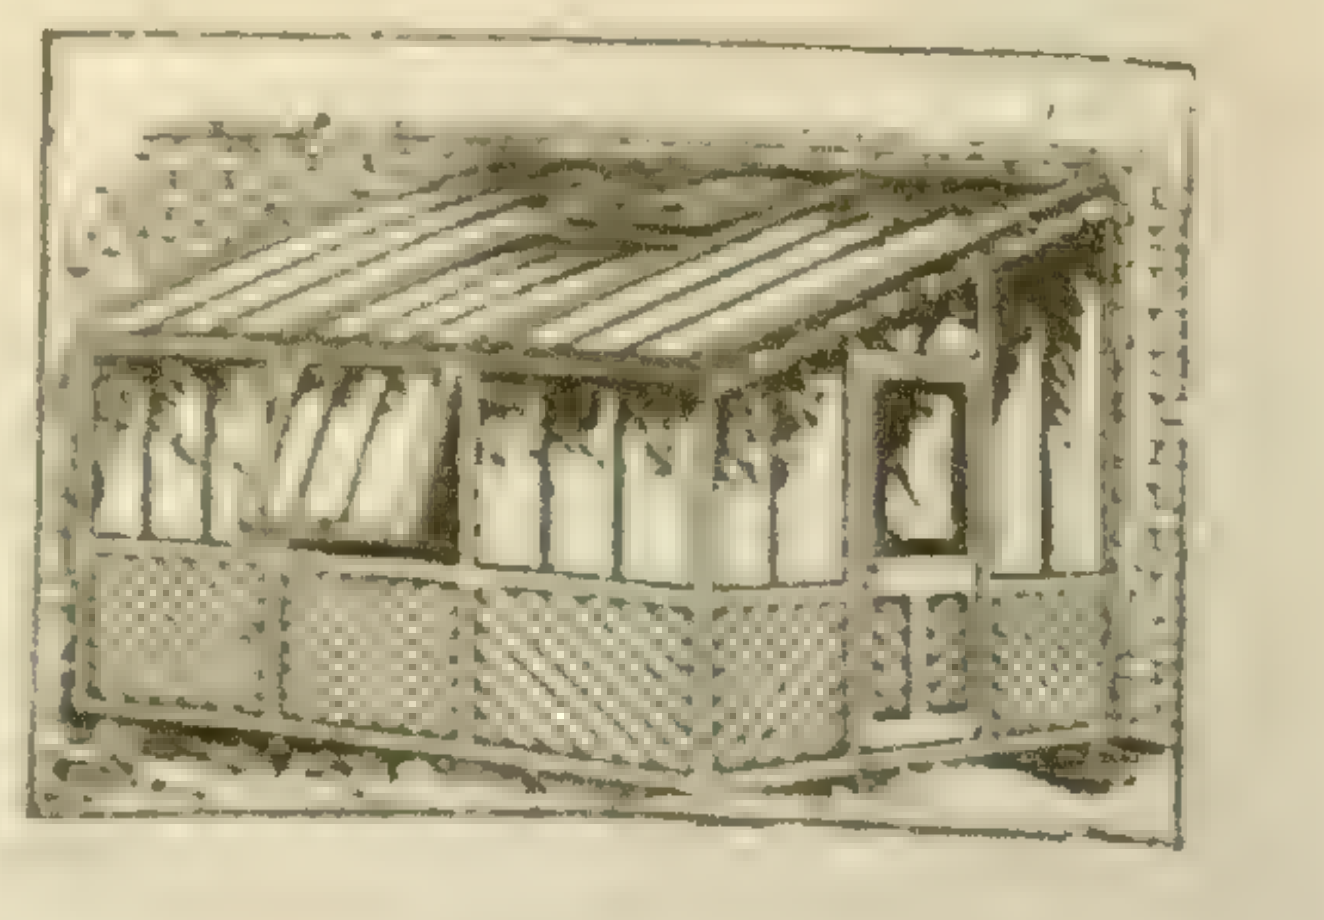
GREENHOUSES FOR THE MILLION.
ALFRED PEEL and SON,
HORTICULTURAL BUILDERS AND HOT WATER ENGINEERS,
WOOD GREEN, LONDON, N.

Beware of Imitations.
The Original Inventor of Portable Greenhouses.
Established 20 Years.

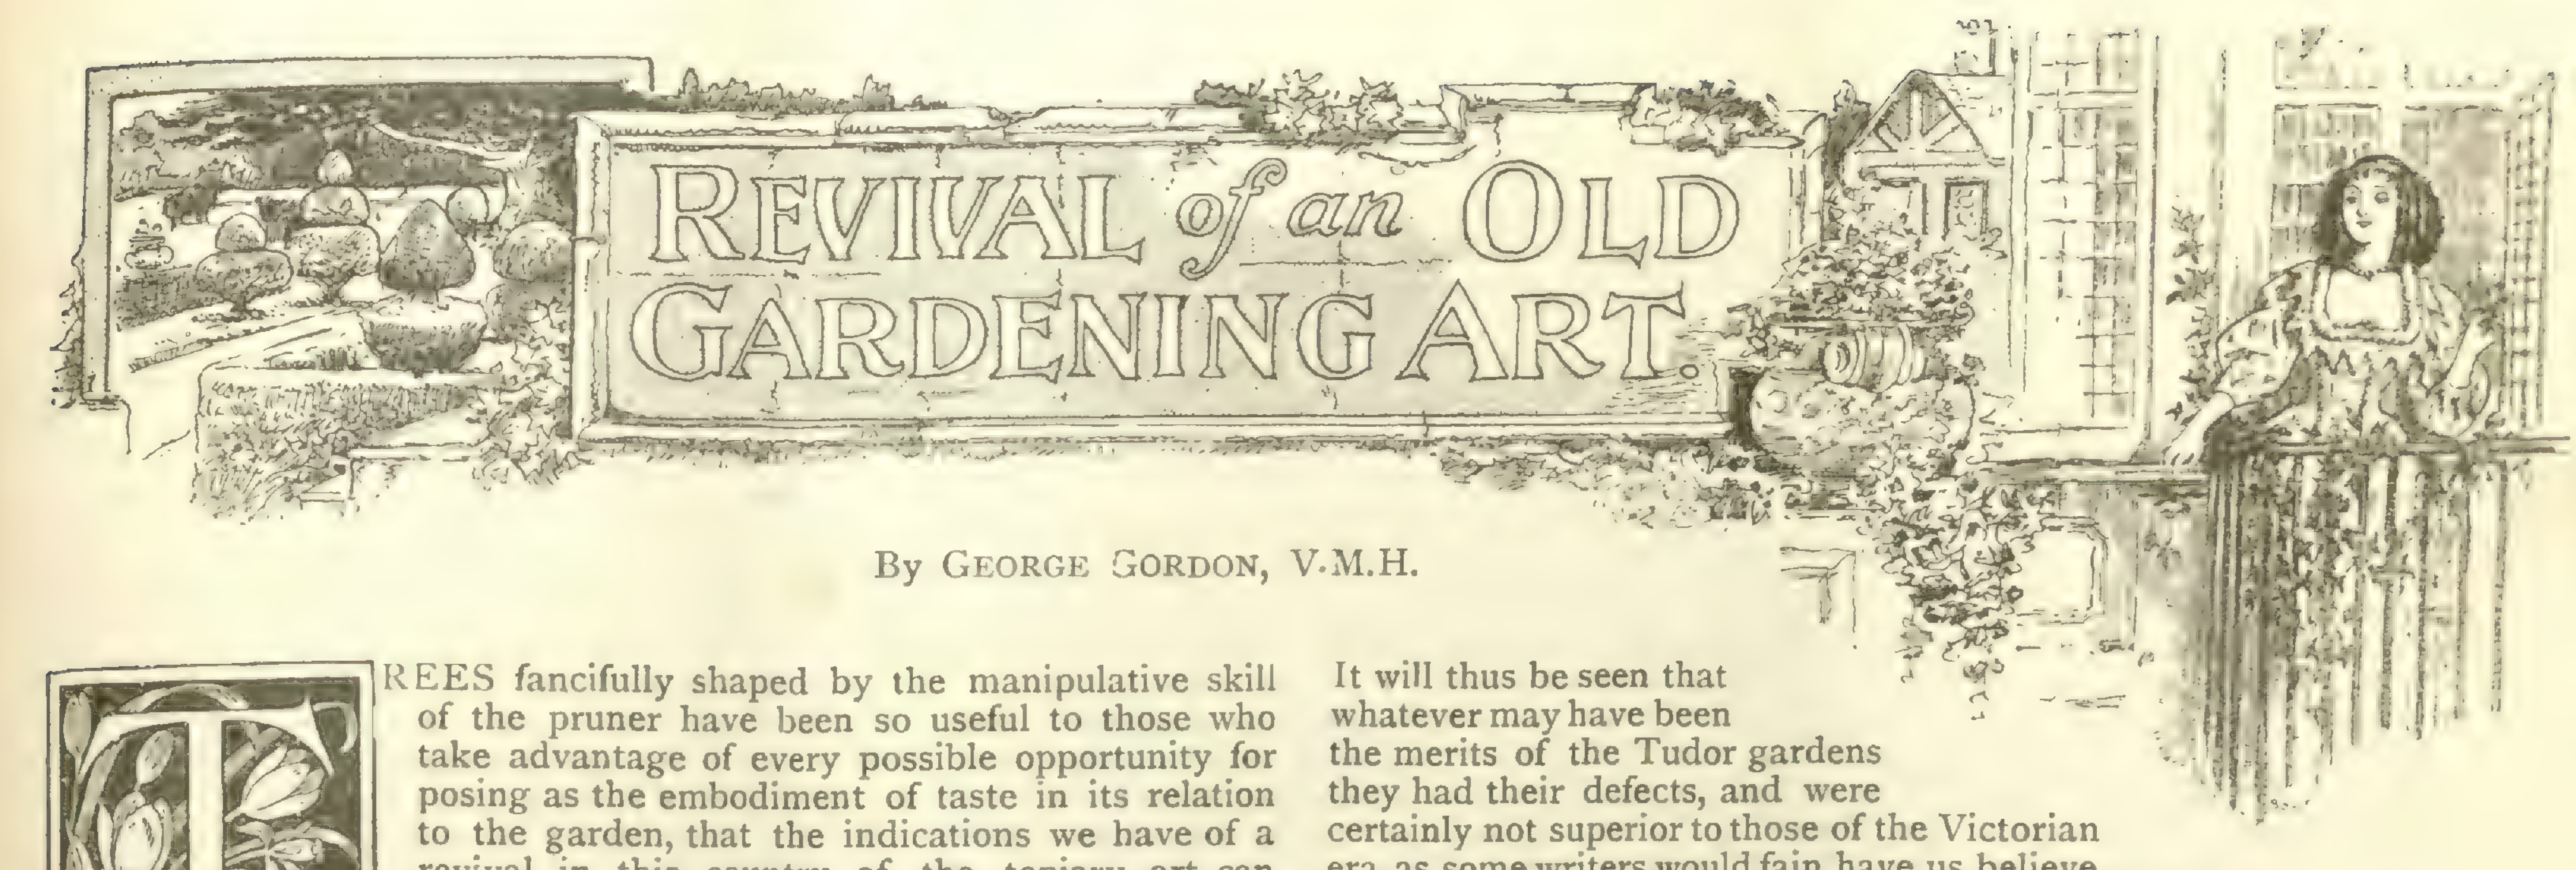
The Best and Cheapest Builders in the Kingdom.

GREENHOUSES COMPLETE from 50s.

Thirteen Medals and Diplomas awarded at the principal Exhibitions. All intending purchasers should inspect our houses before purchasing elsewhere, and compare them with others at the same cost. None but the best materials used.
ESTIMATES GIVEN FOR EVERY DESCRIPTION OF HORTICULTURAL BUILDINGS.
CATALOGUES POST FREE.



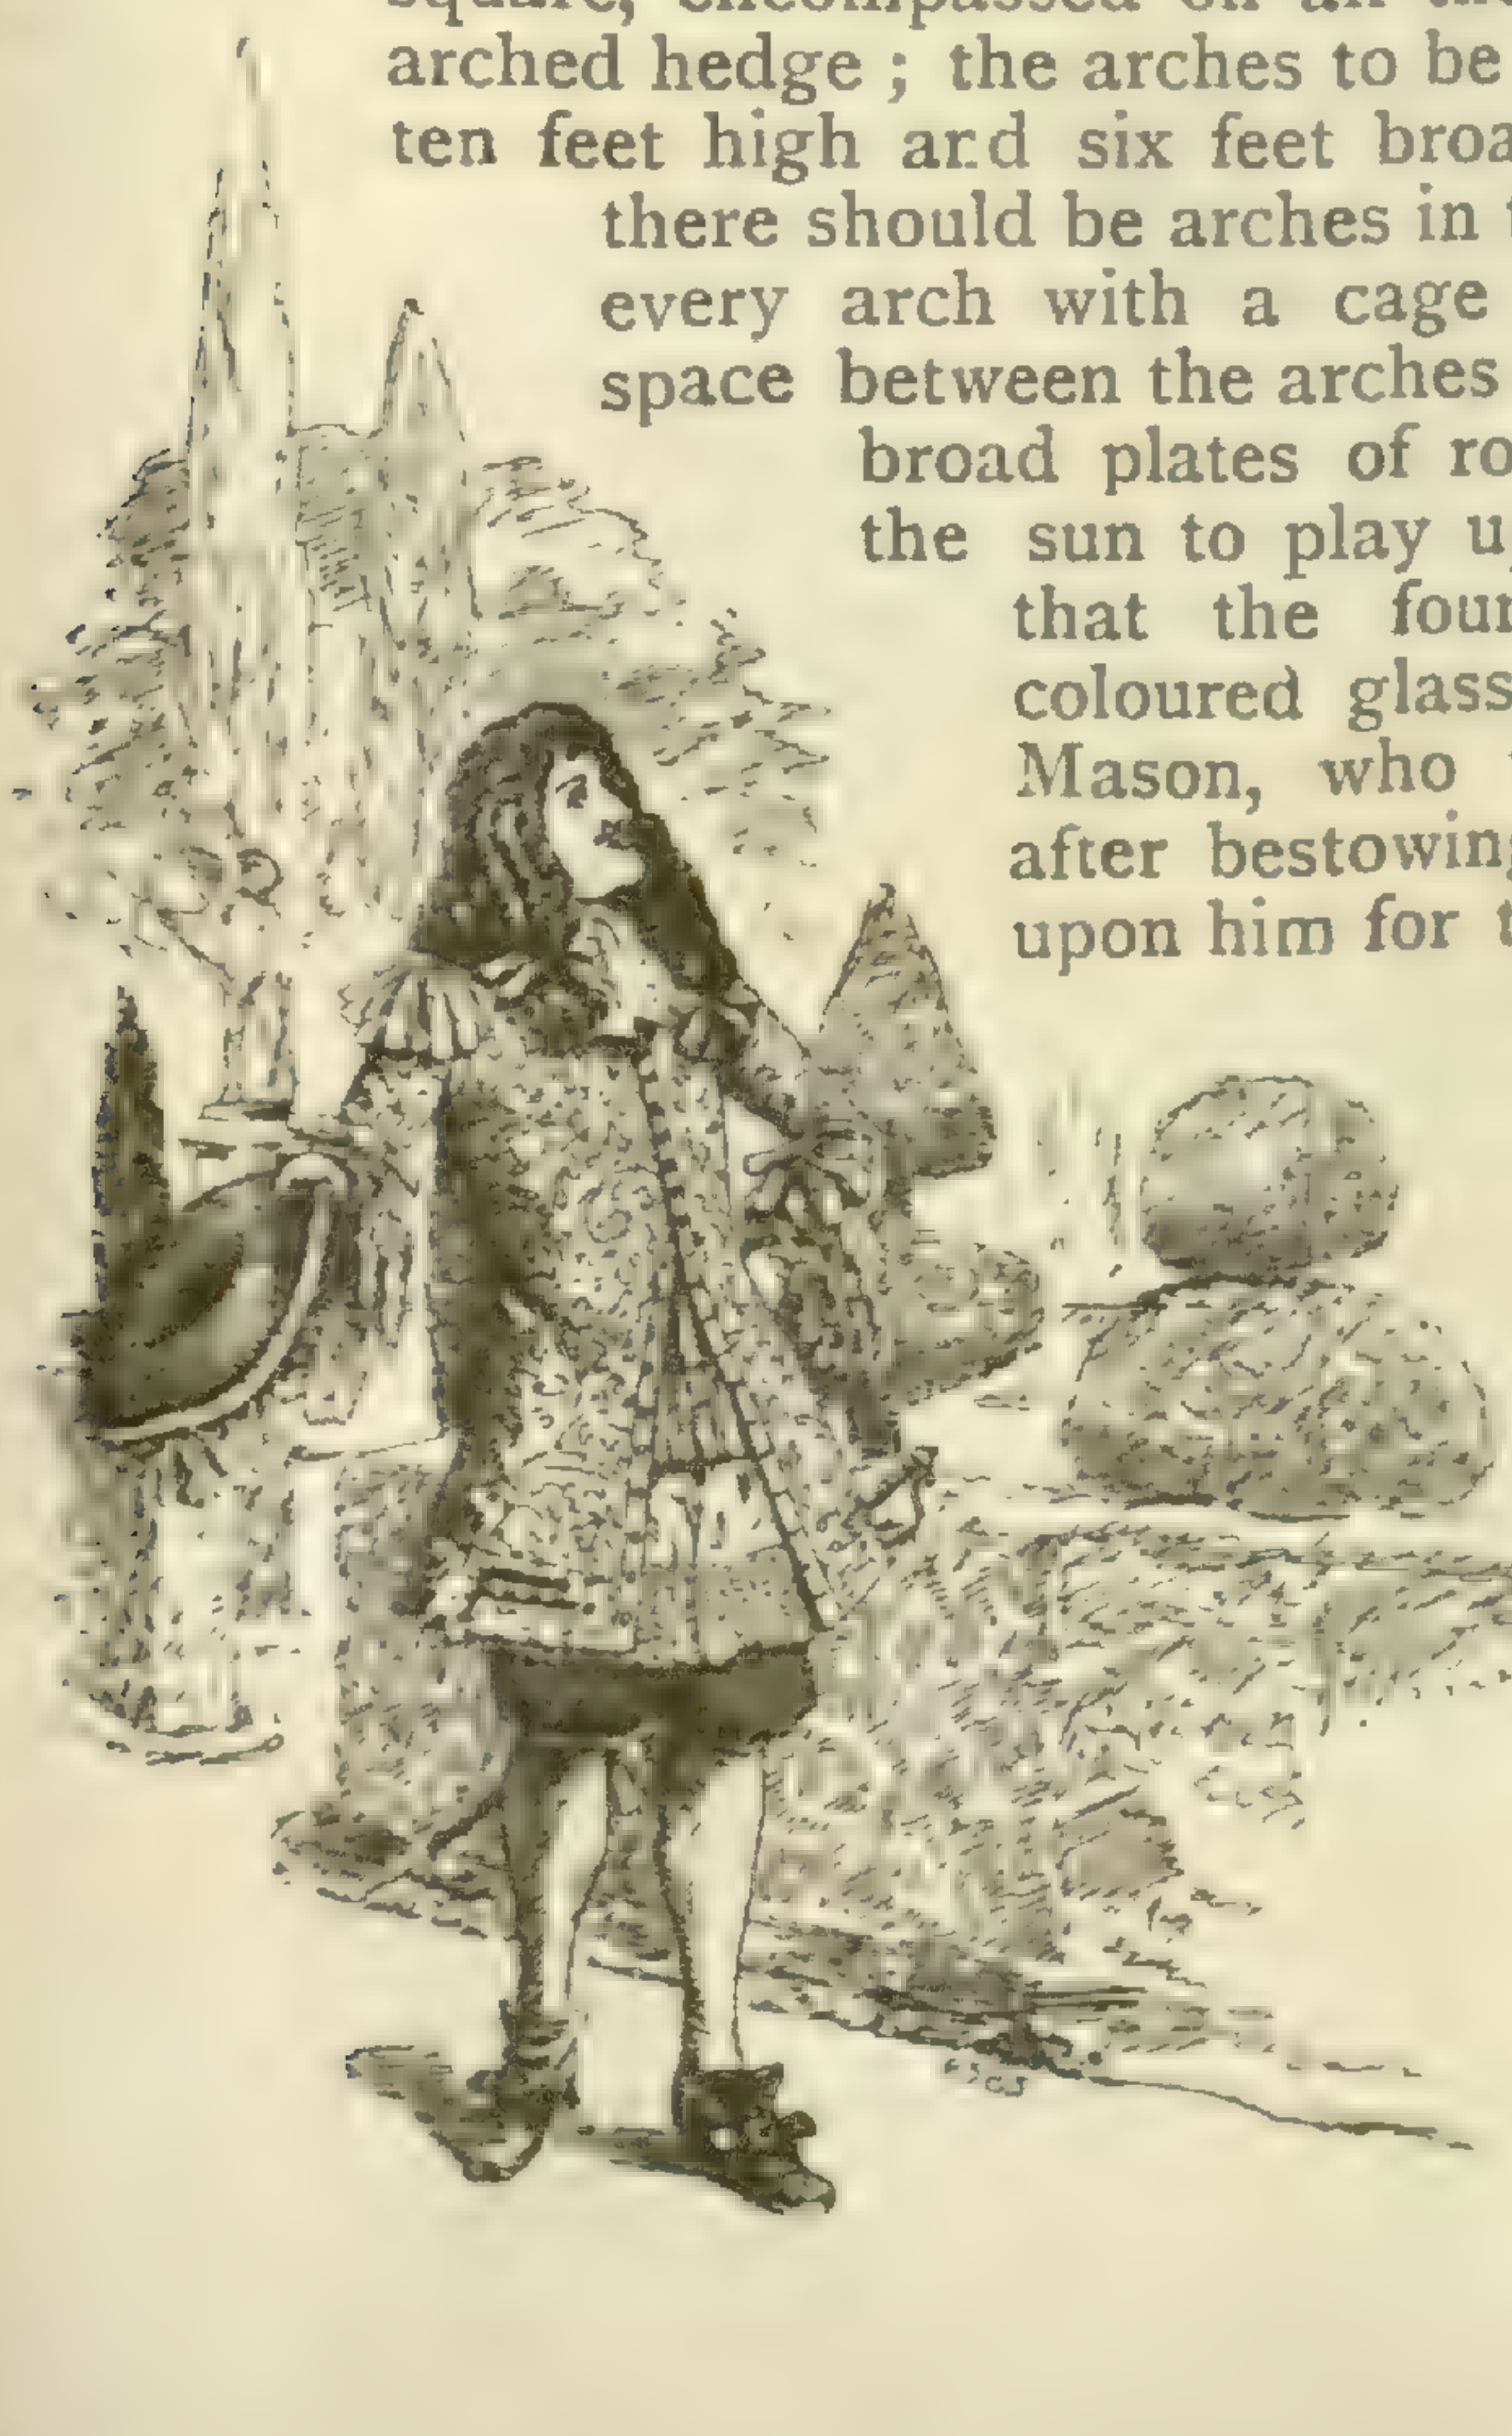
Fir Tree Oil INSECTICIDE
For destroying Insects on Plants. Used by every Orchid Grower of any note all over the world.
The CHEAPEST and BEST.
Half pints 1/6, pints 2/6, quarts 4/6, half gallons 7/6, gallons 12/6, 5 gallon drums 10/6 per gallon Carriage Paid.
E. G. HUGHES, VICTORIA STREET, MANCHESTER.
Sold by all Seedsmen. Pamphlets free on [illegible]



REVIVAL of an OLD GARDENING ART.

By GEORGE GORDON, V.M.H.

TREES fancifully shaped by the manipulative skill of the pruner have been so useful to those who take advantage of every possible opportunity for posing as the embodiment of taste in its relation to the garden, that the indications we have of a revival in this country of the topiary art can hardly fail to afford gratification to some members of the community. To wax indignant about them, to rail against the mutilation of trees, and to give a show of wisdom to people who are exceptionally shallow, are so easy that it is not difficult to understand why signs of some change in this direction should be welcome to the self-constituted arbiters of taste. The justification for a discussion of the relative merits of old-fashioned and modern gardens no longer exists; and with the abolition of the worst features of the bedding system, and the popularity of hardy plants, two perennial sources of criticism have been dried up. There are, of course, some who still believe that gardens of the present day cannot be compared with those of past generations, and of this I have evidence in an essay on the gardens of the Tudor period, which appeared in one of the popular monthlies a short time since. In this essay comparisons are instituted between the Tudor and Victorian gardens, and inferences drawn by no means favourable to the latter. The writer indeed asserts that "when in perfection" the Tudor gardens "were equally stately and beautiful, and in their natural variety far superior to the commonplace blaze of colour in geometrical shapes which make up the modern garden, wherein all individuality seems sacrificed to conventionalism." Following a quotation from the opening paragraphs of Bacon's famous essay on gardens, we are assured that "This is a progressive idea to which all our modern fashionable ones, as enunciated by head gardeners, is opposed." Then we read of "trees of odorous blossom," of "waving boughs and multitudinous fragrance," and of "ample areas of well-mowed evergreen grass, which should delight the eye," as compared with "the modern garden, and the limited ideas which define it, and the scrimpy 'lawn,' with its limited space cut up into octagonal and other beds of verbenas and calceolarias." In writing in this way, it is not difficult to convey to those who do not trouble to think for themselves an idea of superiority in matters of taste and an acquaintance with the styles of gardening that obtained during the two periods. But what are the facts? Instead of the flower garden possessing ample lawns with few flower beds and spacious borders, and so placed as to afford, in country districts, extensive views over park and meadow, it was enclosed between "green," or other walls, and cut up into innumerable beds known as knots, some of which were occupied by flowering plants, while others had spread over the surface some coloured material. "As for the making of knots or figures that they may lie under the windows of the house on that side which the garden stands, they be," says Bacon, in his essay, "but toys; you may see as good sights many times in tarts." Having thus stated his views with regard to the knots, this distinguished writer observes: "The garden is best to be square, encompassed on all the four sides with a stately arched hedge; the arches to be of carpenter's work, of some ten feet high and six feet broad." He also suggests that there should be arches in the hedge with a turret over every arch with a cage for birds, and "over every space between the arches some other little figure with broad plates of round coloured glass, gilt, for the sun to play upon." He further advises that the fountain be "embellished with coloured glass and such things of lustre." Mason, who was an admirer of Bacon, after bestowing a liberal measure of praise upon him for the efforts he had made with a view to the improvement of the garden of his days, writes in the first book of his "English Garden":—



"The age of tourneys, triumphs, and quaint masques,
Glar'd with fantastic pageantry, which dimm'd
The sober eye of truth, and dazzled ev'n
The sage himself; witness the high arch'd hedge,
In pillar'd state by carpentry upborne
With coloured mirrors deck'd and prison'd birds."

It will thus be seen that whatever may have been the merits of the Tudor gardens they had their defects, and were certainly not superior to those of the Victorian era, as some writers would fain have us believe.

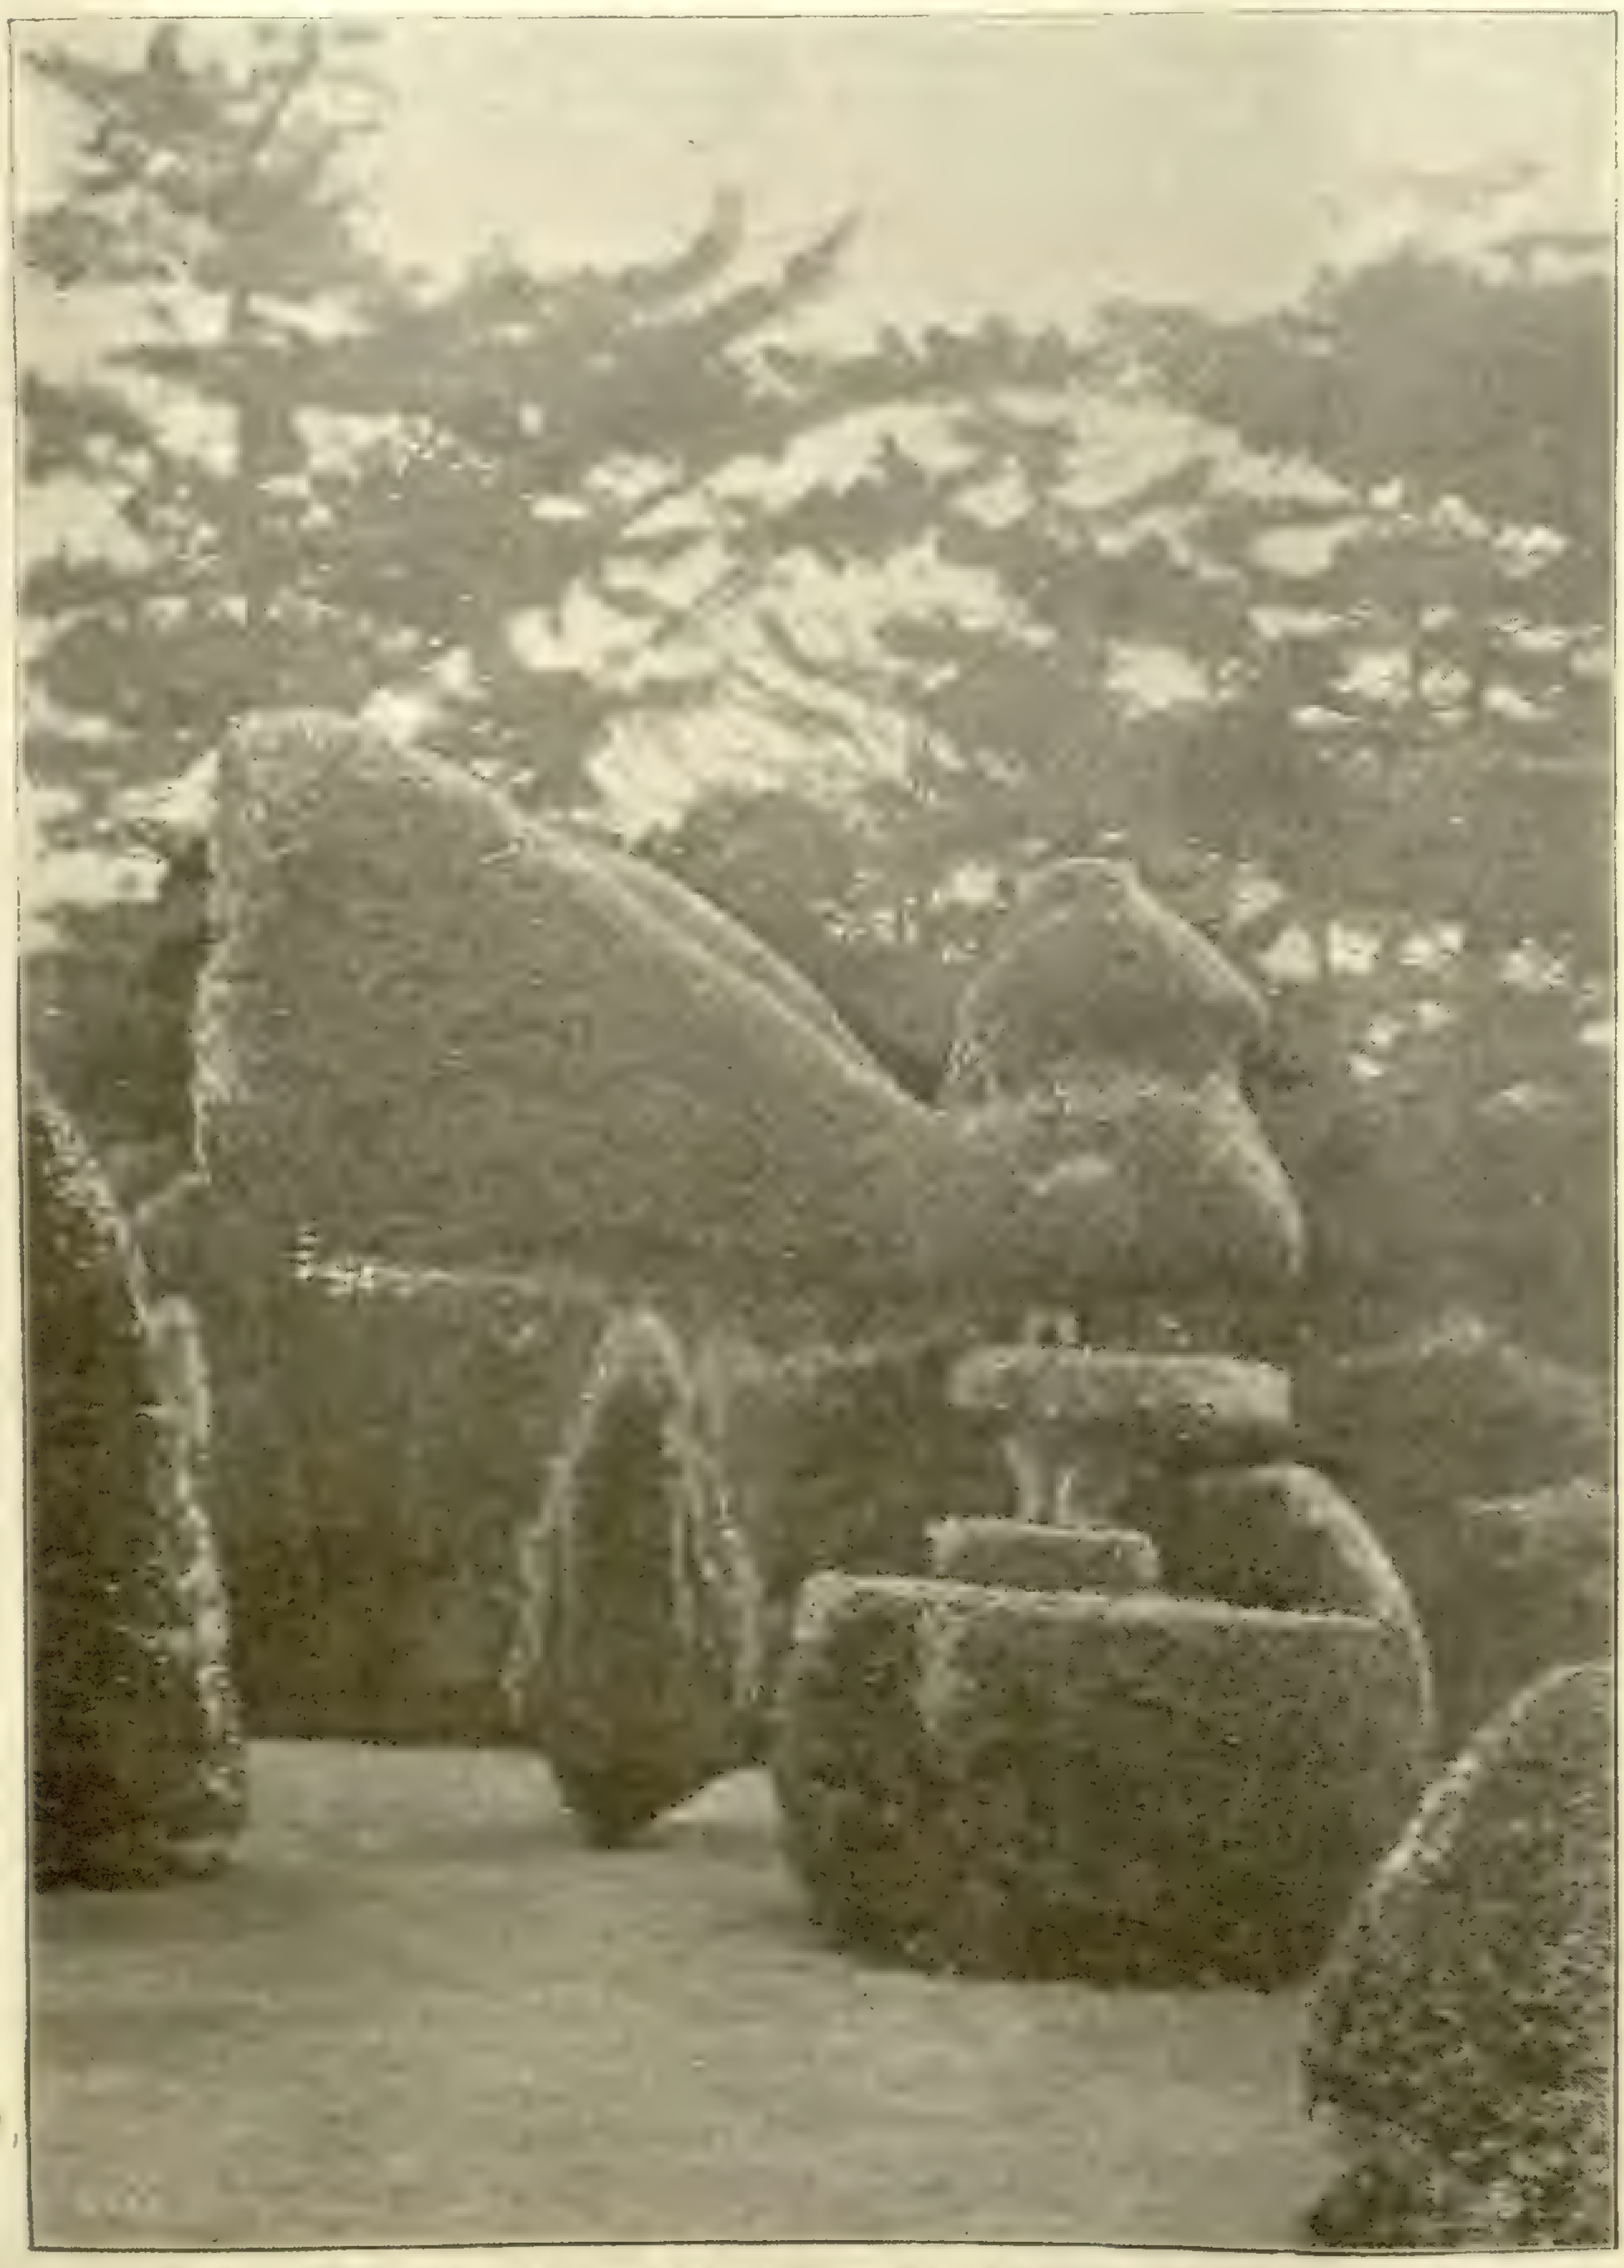
Unquestionably in the gardens of the Elizabethan era

"There likewise mote be seen on every side
The shapely yew, of all its branching pride
Ungently shorn, and, with preposterous skill,
To various beasts and birds of sundry quill
Transformed, and human shapes of monstrous size.
Also other wonders of the sportive shears,
Fair nature misadorning, there were found:
Globes, spiral columns, pyramids and piers,
With spouting urns and budding statues crowned;
And horizontal dials on the ground
In living box, by cunning artists traced;
And galleys trim, or on long voyage bound,
But by their roots there ever anchored fast."

The shaping of trees with shears and knife is frequently spoken of as mutilation, but with greater propriety it is called topiary work, from the Latin *topiarius*, shaped by cutting, the word being used in this sense by Pliny, Vitruvaris, Cicero, and other of the classical authors. In giving what must necessarily be a brief sketch of the history of the art, it is not my intention to strongly advocate the practice of shaping trees according to the taste of the pruner, with a view to accelerating the revival of which we have indications. On the other hand, I do not purpose condemning it as extravagant and absurd. It is undoubtedly true that the natural form of a tree is the most beautiful form possible for that particular tree; but it sometimes happens that we do not want the most beautiful form, but one of our own designing, for the sake of the variety it affords. So far as authority bears on the subject, it is distinctly in favour of topiary, for the Romans recognised the shaping of trees into architectural forms as an essential part of the gardening art. Shakespeare is quoted as an authority on a great diversity of matters, and more particularly in defence of "the natural style of gardening." But there can be no question that the garden of Shakespeare's time was a garden of knots and topiary. It was—as indicated by the quotation from Bacon—enclosed with hedges of clipped hornbeam and yew, and embellished with arbours, obelisks, pyramids, and spires of verdant greenery. The "curious knotted garden" mentioned in the letter of Arnado, in the first scene of "Love's Labours Lost," was, beyond all doubt, furnished with examples of the topiary art.

Shakespeare was familiar with such gardens as the one above described, and approved of the prevailing taste of his time. Bacon had no liking for clipped trees, and with reference to them he says in his essay, "I for my part do not like images cut in juniper or other garden stuff; they be for children." Many of those at the present day regard things of lustre as toys for children, and in so doing they render it impossible for them with any degree of consistency to set up Bacon as an arbiter of taste. We can go back to a time long anterior to Shakespeare for authority for the shaping of trees into fanciful forms, for the topiary art was practised with much success in Roman gardens in the first century of the Christian era. It attained a high state of development in the gardens of Pliny's Tuscan villa. According to Malthus these famous gardens were of large extent, and from the terrace, with its stately colonnade, the visitor descended to the lawn, on which were numerous figures cut in box trees. Surrounding the lawn was a broad walk enclosed by evergreens cut into a variety of forms, and a long stretch of grass used for chariot exercise, intersected by two rows of box trees representing various domesticated and wild animals. In other parts of the ground were innumerable examples of the art, including animals, obelisks, and letters—some being the initials of the owner, and others of the persons employed in the management of the garden. There can be no doubt that the garden of Pliny's villa, as it existed at the end of the first century, when, under the reign of Trajan, Rome was at the zenith of her glory, set the fashion of European gardening for many centuries. The resemblance of the Dutch and French gardens in the sixteenth and seventeenth centuries to that of Pliny's villa is remarkable. In them were the raised terrace along the principal front of the house, with the gradual slope to the lawn, the small geometrical flower garden cut up into numerous small beds, with a fountain in the centre; and walks flanked by trees, mostly shaped into a diversity of fanciful forms. With reference to the style of gardening adopted by Pliny, Walpole writes: "In an age when architecture in all its grandeur, all its purity, and all its taste; when arose Vespasian's Amphitheatre, the Temple of Peace, Trajan's Forum, Domitian's Bath, and Adrian's Villa, the ruins and vestiges of which still excite our astonishment and curiosity; a Roman Consul, a polished emperor's friend, and a man of elegant literature and taste, delighted in what the mob now scarcely admire in a college garden. All the ingredients of Pliny's garden correspond exactly with those laid out by Loudon and Wise on Dutch principles; so that nothing is wanting but a parterre to make a garden in the reign of Trajan serve for the description of one in the reign of King William."

It was, however, as easy for Walpole to denounce Roman taste in gardening as it is for present-day critics to condemn the prevailing fashions in horticulture; but such criticism may be considered as proceeding from too limited views of the subject. The Roman gardens were regarded as scenes of art, and treated as such; and, therefore, it does not follow that the owners were without a proper appreciation of the charms of natural scenery. As Loudon very properly observes, where all around is Nature, artificial scenes, even of the most formal description, will please, and may be approved by the justest taste, from their novelty, contrast, and other associations. "If," asks Loudon, "all England were a scattered forest, like ancient Italy, and cultivation were to take place only in the open glades, or plains, where would be the beauty of our parks and picturesque grounds?" With the decline of the Roman Empire, which is considered as having commenced with the reign of the Emperors, the taste for a country life underwent a material change, and in the ages that followed the fall of the Republic the interest in gardening and other arts died out in proportion to the removal of the means for enjoying them. The art of culture was preserved by the monks during the dark ages, and in the fourteenth century there was a material change for the better in the condition of Italy, accompanied by a revival of interest in the gentle art of gardening. At an early period of this revival the famous gardens of Lorenzo de Medici and Bernand Rucelli were formed, and these were arranged on the same lines as those of Pliny's villa. Gardens, geometrical in design and furnished with examples of the topiary art, had become general throughout Italy, and Forsyth describes a garden at Genoa, in which an illustration of the chase was given in verdant sculpture. A large amount of evidence of the general practice of shearing trees in Italy might be given, but it must suffice for my present purpose to state that in the second half of the seventeenth century Evelyn visited Italy and described a considerable number of gardens, and in his account of those of the palace of Hieronymo del Negro he sates that "on the terrace, or hilly garden, there is a grove of stately trees, among which are sheep, shepherds, and wild beasts."



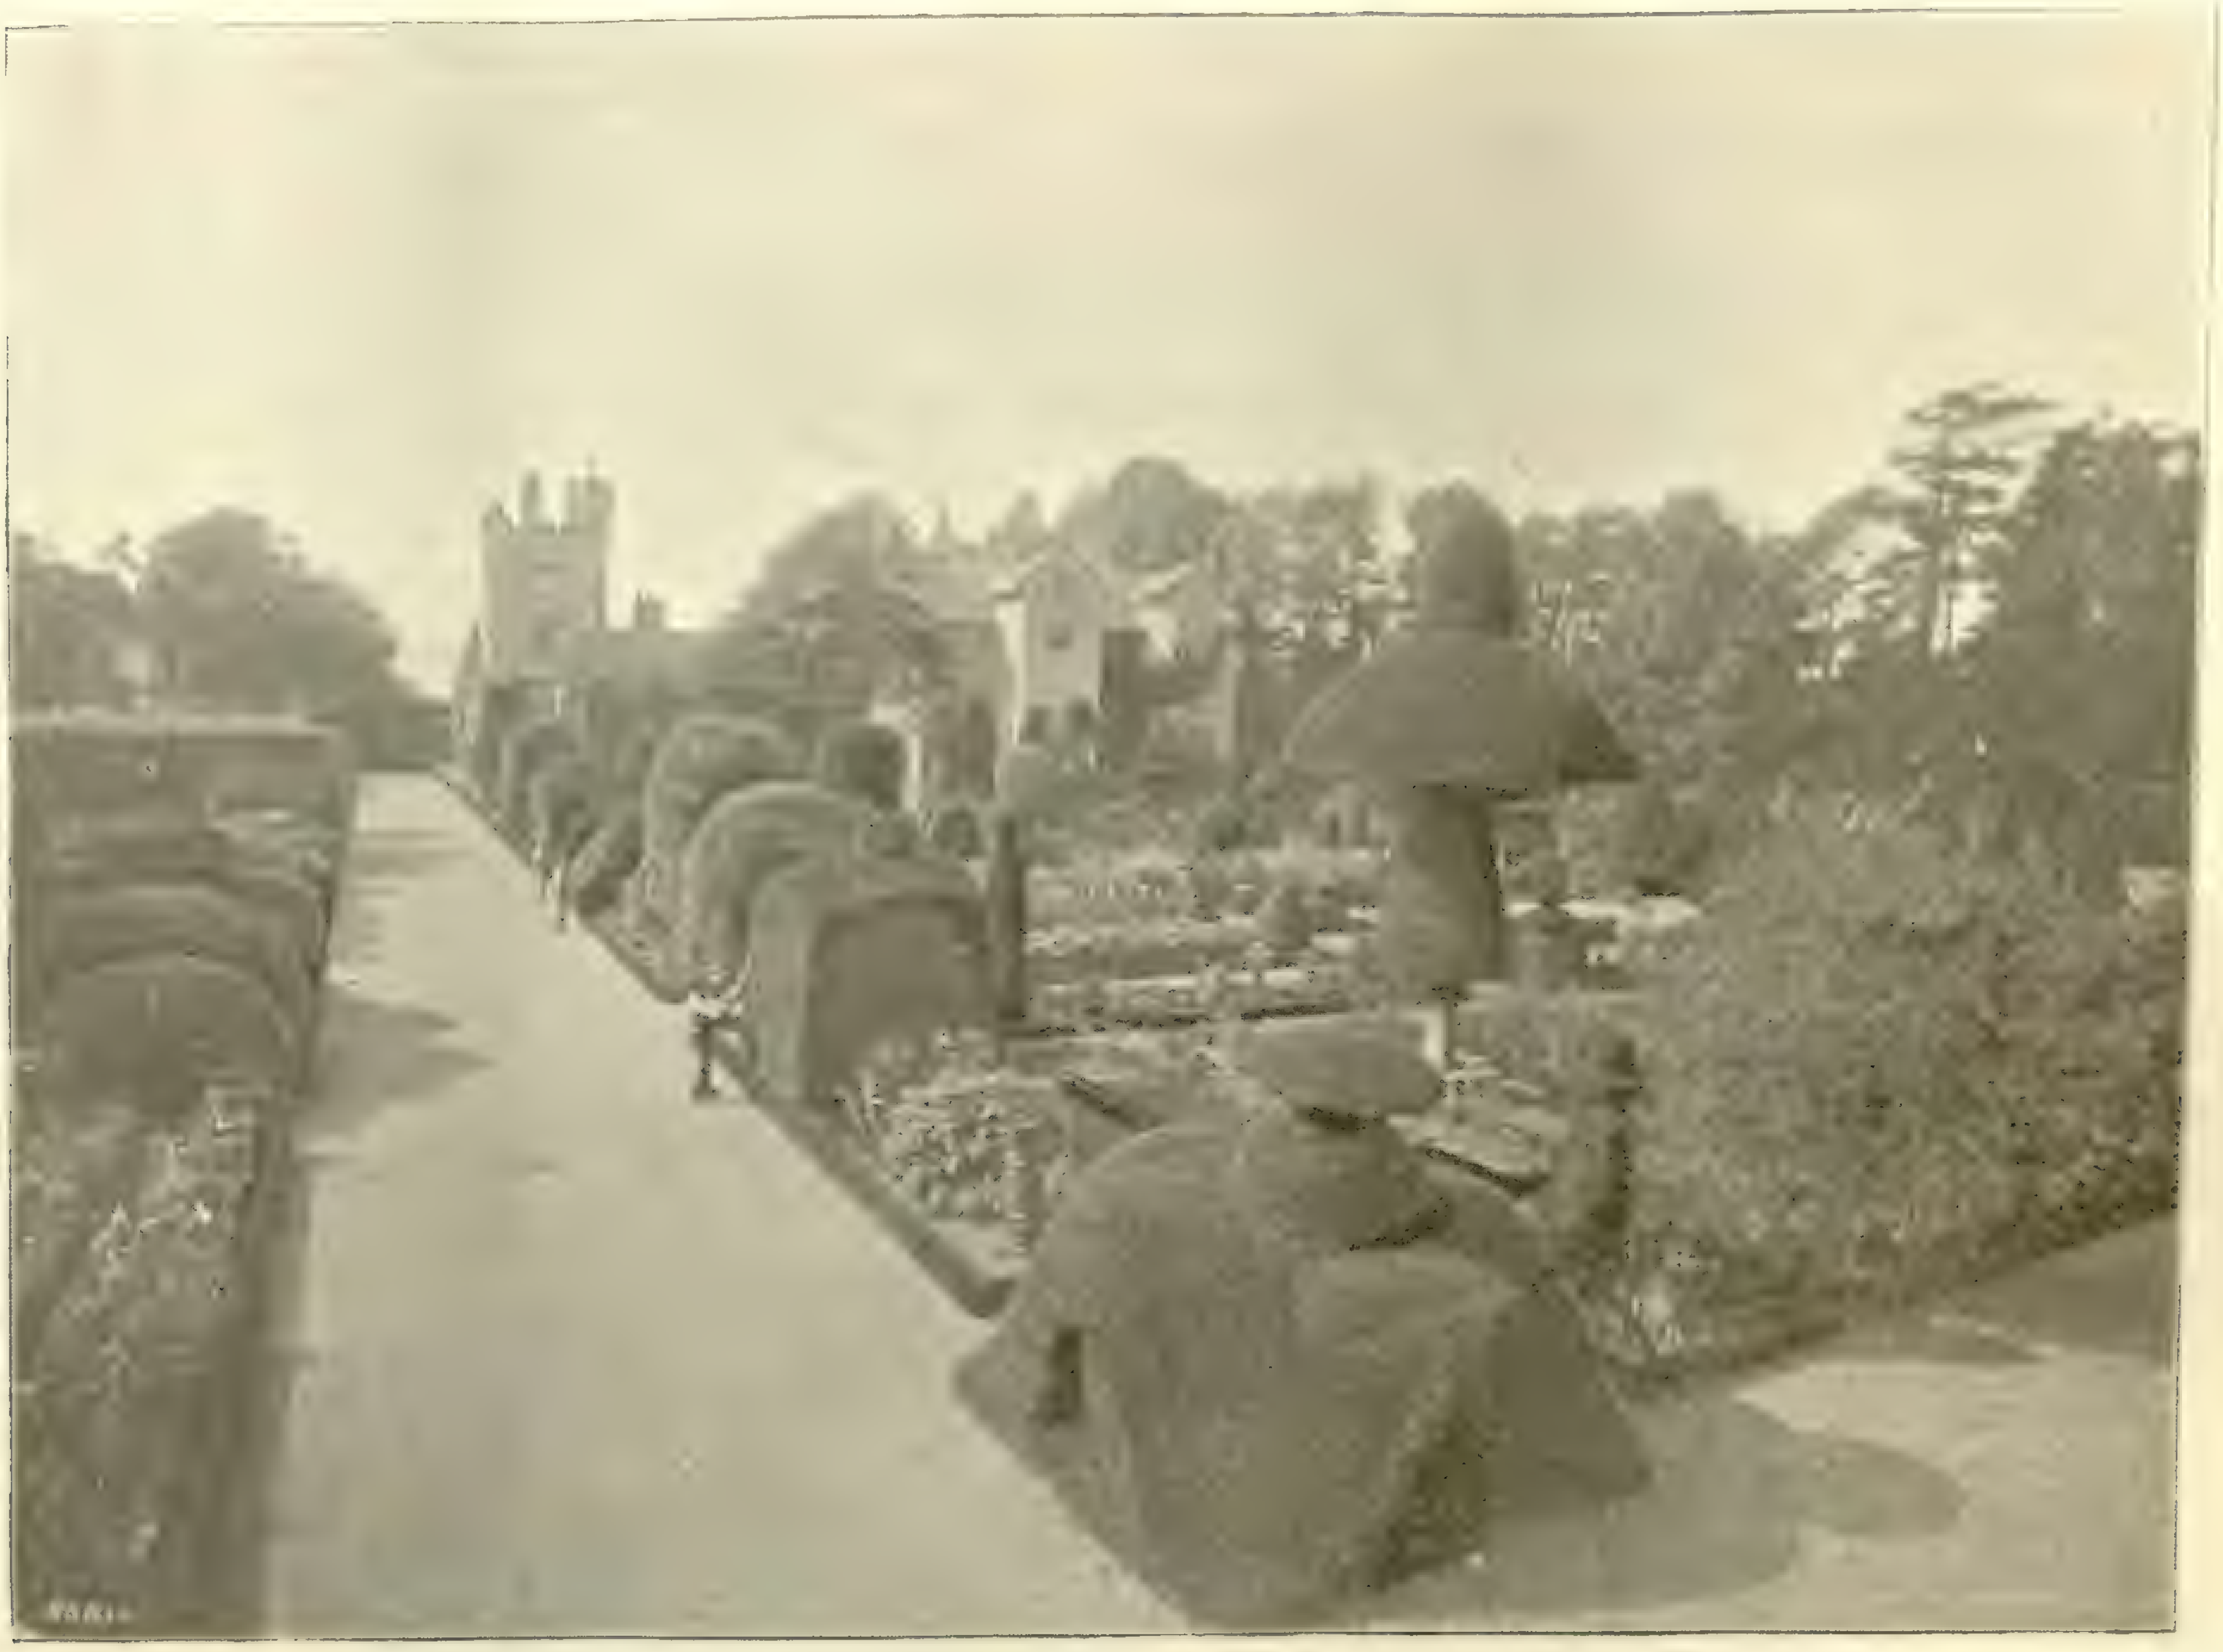
A VERDANT PEACOCK, ELVASTON CASTLE.

The practice of the topiary art had in the meantime extended far beyond the Italian boundaries, and was adopted somewhat extensively in France and Holland. It was not until the sixteenth century that clipped trees came into vogue in this country, and this is not surprising, as it was not until the termination of the Wars of the Roses, towards the end of the fifteenth century, and Henry VII., the first of the Tudor line, had ascended the throne, that gardening in any form obtained attention. With a cessation of internecine wars a new style of architecture was adopted, and the garden was no longer confined within the moat with which houses of importance were in those days surrounded. This extension of area gave greater scope for the exercise of taste in the arrangement of the garden, and also for the cultivation of ornamental plants. The first of the introductions consequent on this change were flower beds enclosed with low railings, which acquired a considerable degree of popularity, and remained in use for a long time. Gardening made considerable progress during the reign of the above-named monarch, and in the year 1522 his successor, Henry VIII., made numerous alterations in the flower gardens at Hampton Court, when railed beds were used; and their popularity for some years afterwards is shown by the fact that eleven years later the sum of £14 was paid for painting 760 yards of railing green and white in "Antyke oiled colours."

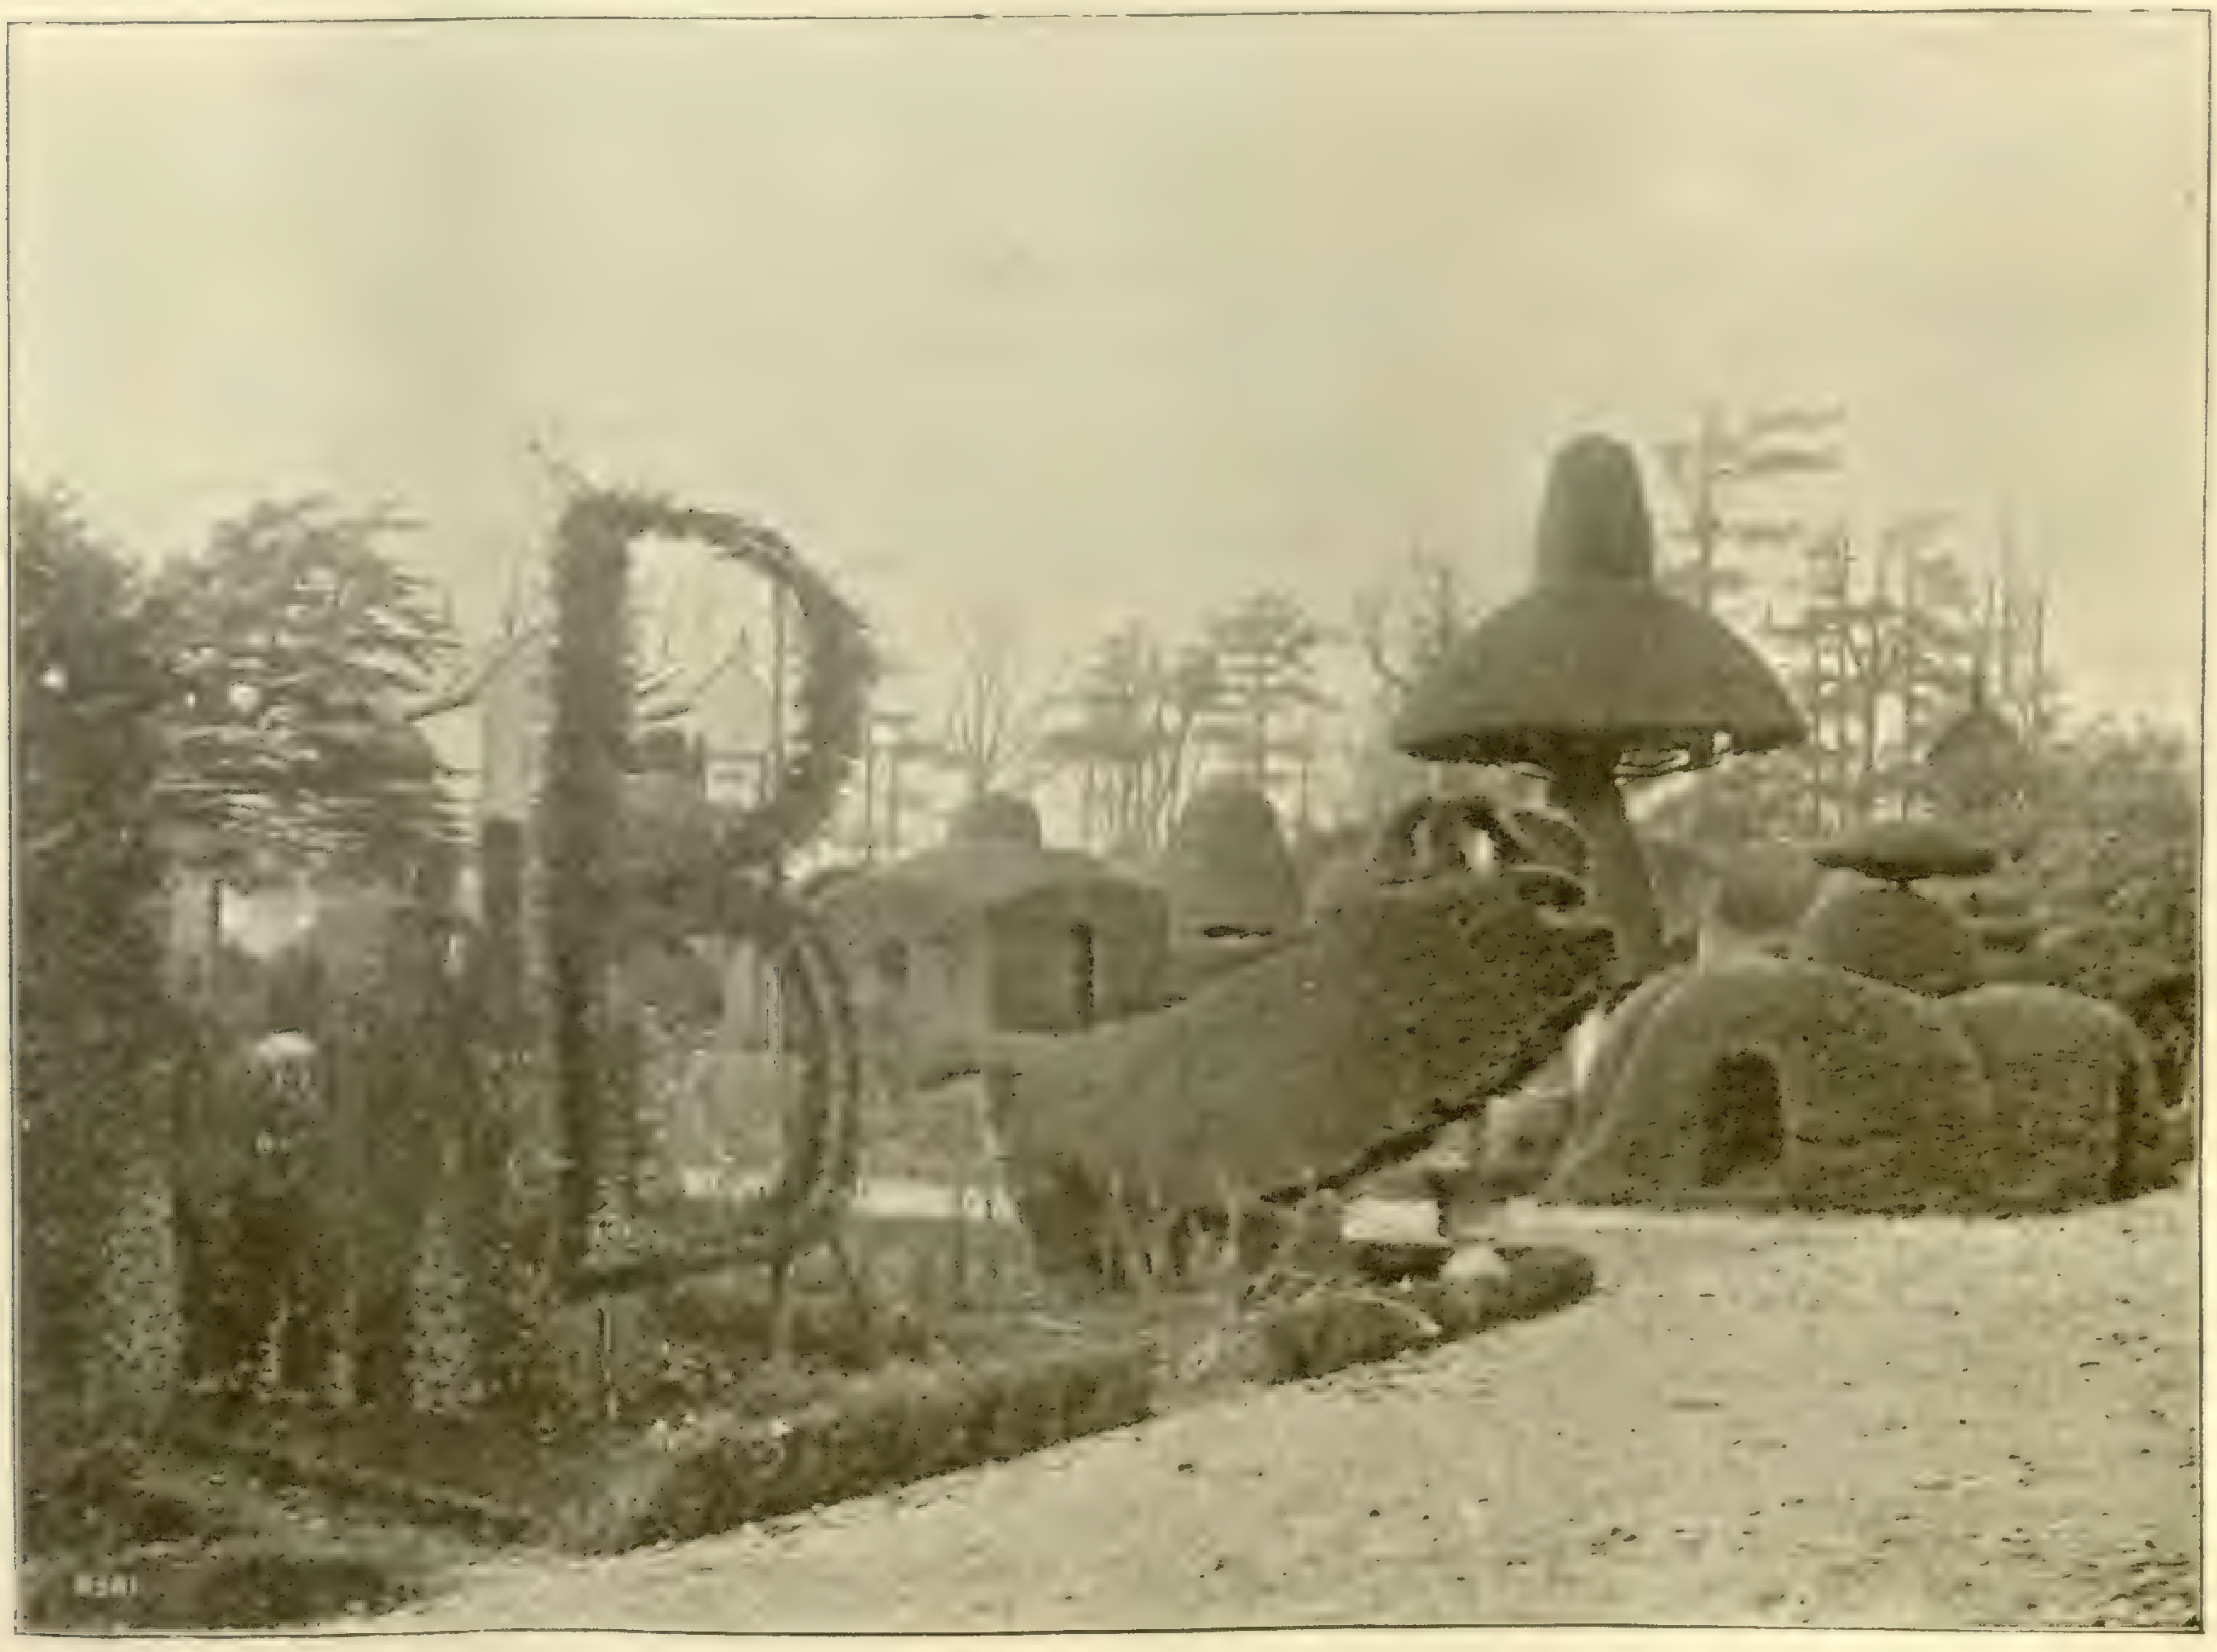
During the first half of the sixteenth century topiary work was introduced into England, and it acquired popularity with such extreme rapidity that examples were soon met with in all gardens of any pretensions, and it obtained so strong a hold upon the community that for at least one and a-half centuries it was the chief feature of the English garden. That topiary work was terribly overdone goes without saying, for it has ever been the practice to carry fashions to the point of absurdity, and the formality and finish characteristic of closely shaven trees afforded so pleasing a contrast to the roughness which had previously prevailed that owners of gardens readily made the mistake of attaching undue importance to clipped trees for the adornment of the pleasance. Leland records in his "Itinerary," published in the first half of the sixteenth century, numerous examples of the art of topiary, and he mentions that at Uskelle village, a short distance from Newton, there was "a goodly orchard with walks opere topiario," and that at Wrisehill Castle there was "an orchard with mounts opere topiario writhen about in degrees like cokilshells to come to the top without paine." Mounts of the description mentioned by Leland were about this time made in a large number of the more important gardens, the walks being flanked with closely clipped hedges or trees.

Topiary received, as a matter of course, considerable attention from writers on horticultural subjects during the seventeenth century, and Lawson remarks in his "Complete Gardener," published in 1618, "Your gardener can form your lesser wood to the shape of men and animals in the field ready to give battle, or swift running greyhounds to chase the deer or hunt the hare. This kind of hunting shall not wast your corn, nor much of your coyne." Lawson could not have had much experience of clipped trees, or he would have known that while a verdant pack with their accompanying horsemen will not beat down the crops of corn, they cannot be kept in first-class condition without a considerable outlay. Gervase Markham gives in his "English Husbandman," published in 1635, numerous figures of knots, mazes, and labyrinths, with reference to which he observes: "Many other adornations and beautifyings there are which belong to the setting of a curious garden, but forasmuch none are more rare or more esteemed than these I have set down as being the best ornaments of the best garden of this kingdom, I think them sufficient for every husbandman or other of better quality which delighteth in the beauty and well-trimming of his grounds." Le Notre, the accomplished and highly popular gardener of Louis XIV., exercised in his day a considerable influence upon landscape gardening in this country, and here, as in France, did much to popularise topiary.

The most noteworthy example in England of the Dutch style of gardening, in which the topiary art attained its highest degree of development, is at Levens Hall, Westmoreland, the residence of Captain Bagot, where no material change has been made in the grounds for at least two centuries, and where, consequently, may be seen the form of garden that found favour with William III., who exercised so great an influence in developing a taste for the Dutch style, in which clipped trees were so prominent. With the flight of James II., in 1688, Colonel Grahame, who was one of the king's most devoted adherents, retired to his Westmoreland estate, and some time subsequently he engaged M. Beaumont, who had made considerable alterations in the Hampton Court Gardens, to lay out the grounds. The two illustrations of these justly famous gardens will afford an excellent idea of the large number of clipped trees they contain. To particularise the trees would require much space, and it must suffice to mention Queen Elizabeth and her

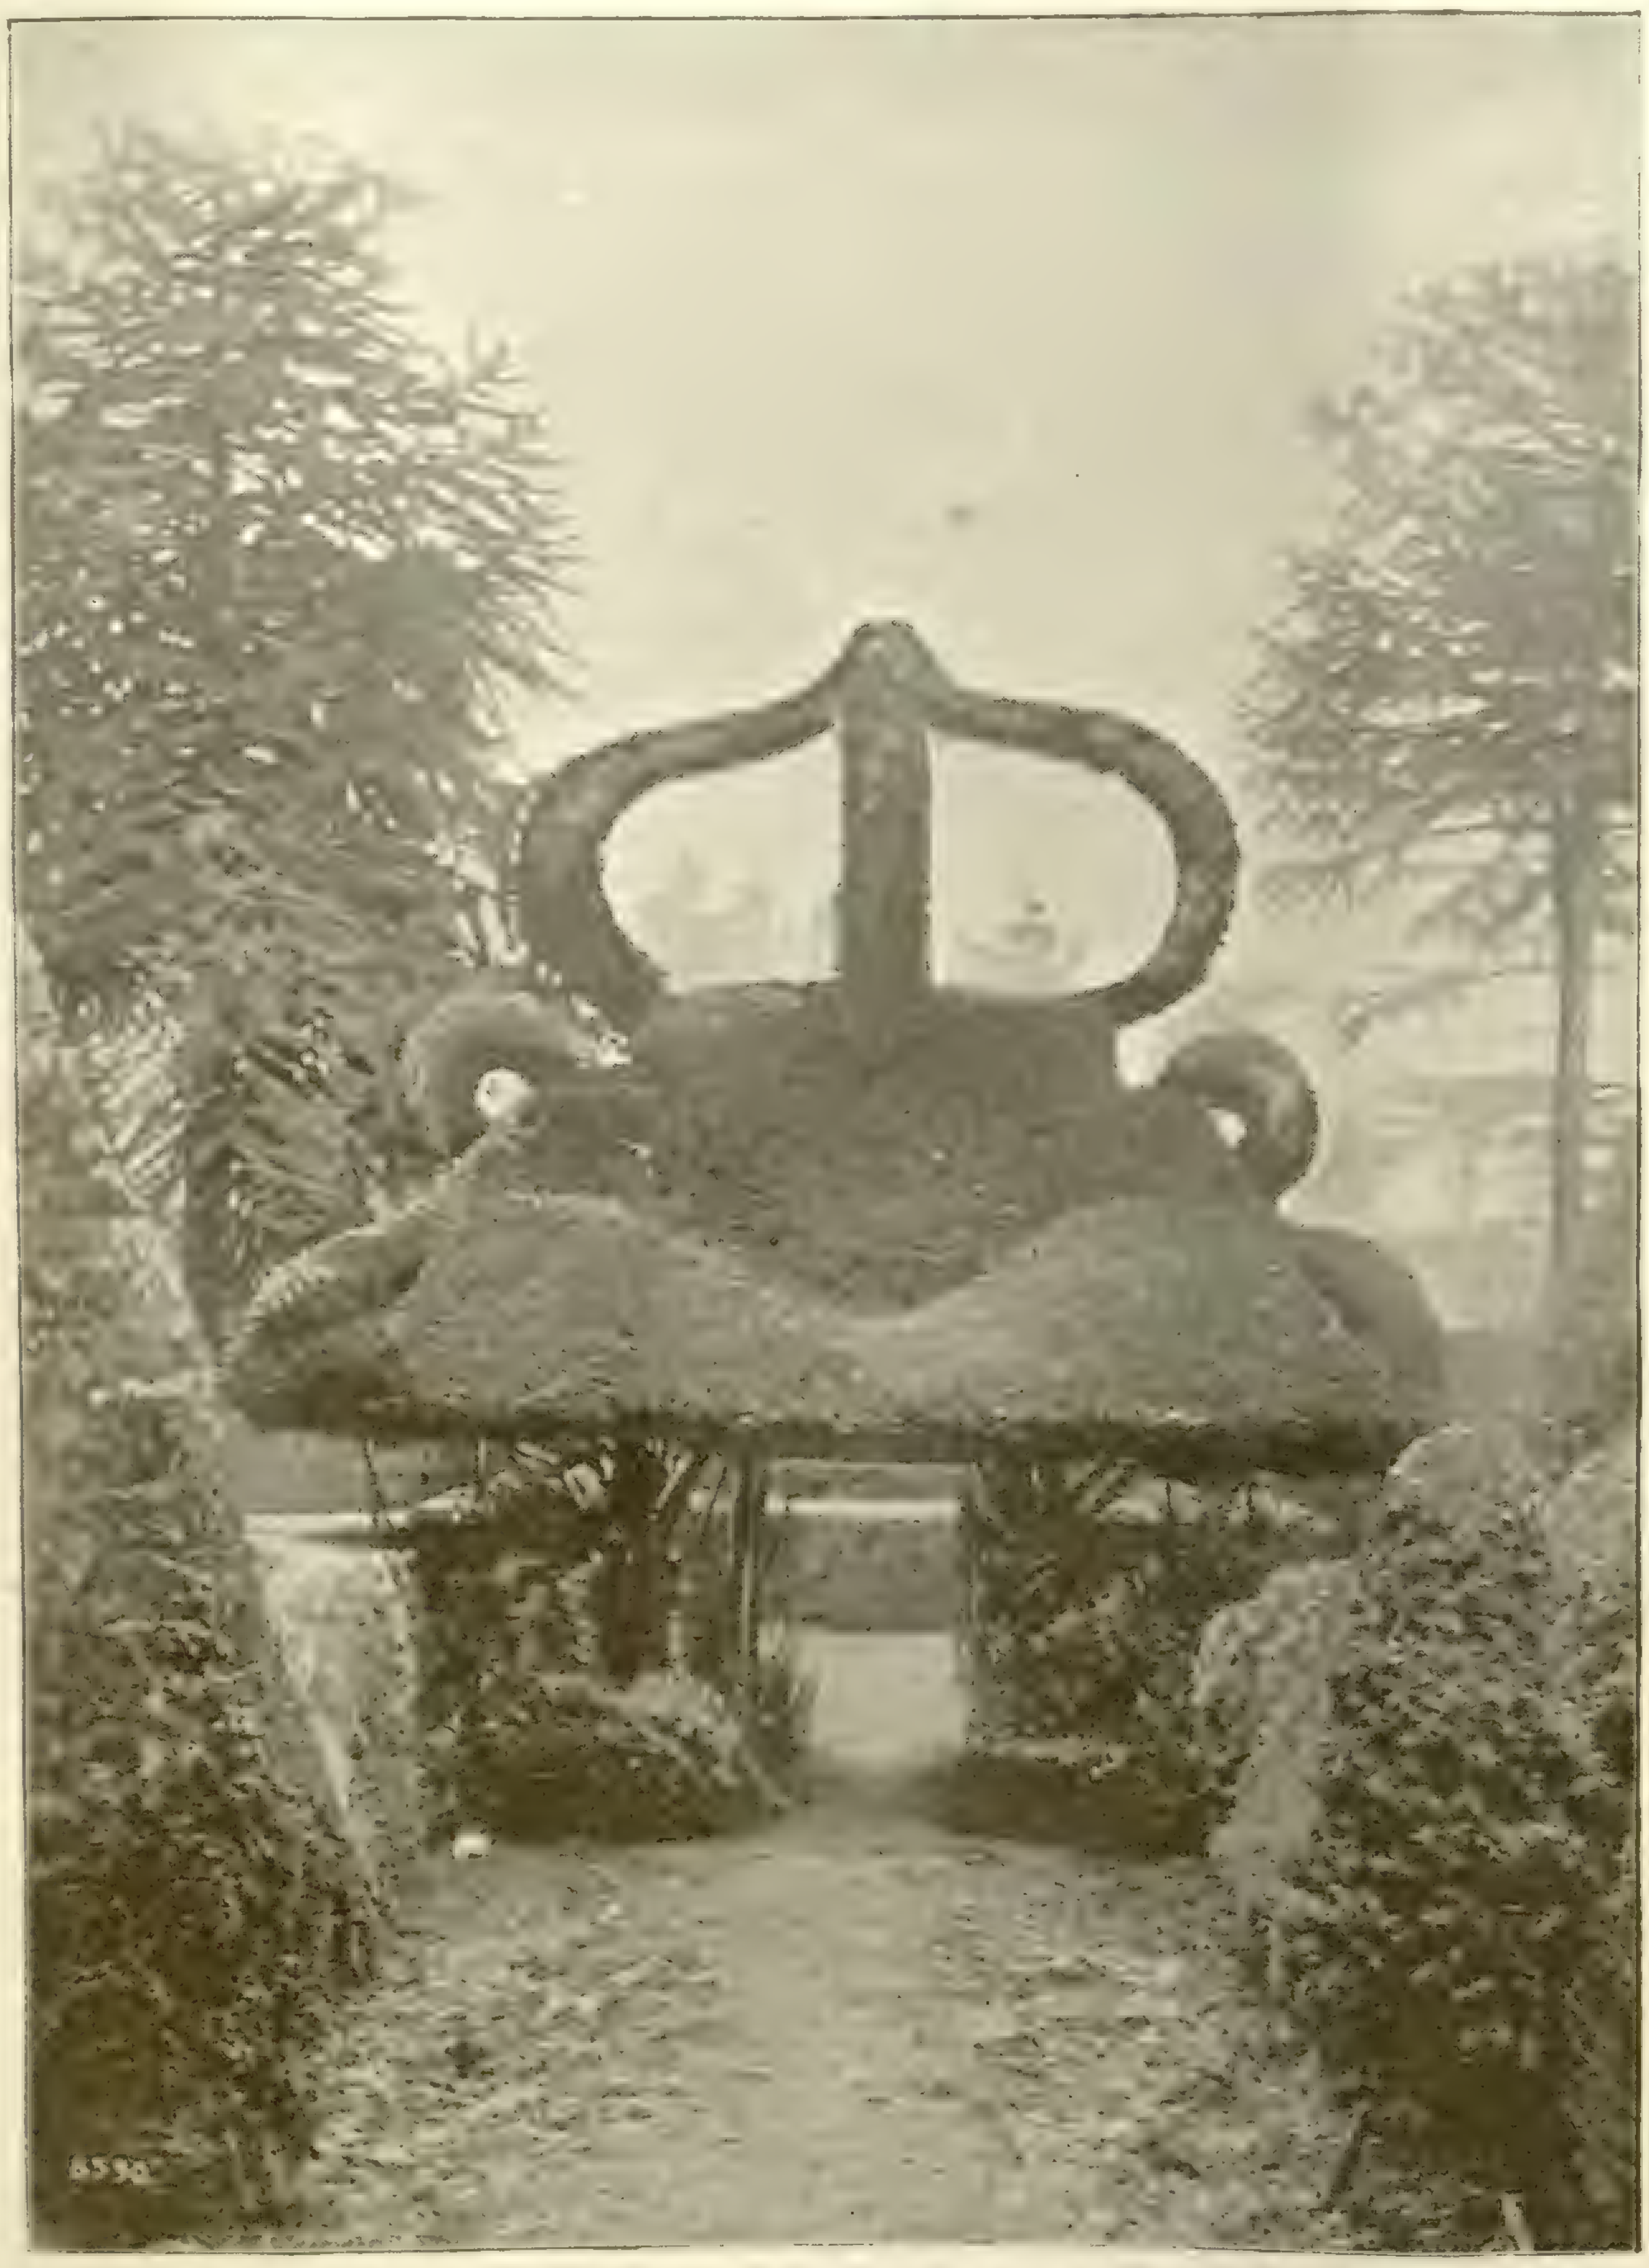


OLD DUTCH GARDEN, LEVENS HALL.



EXAMPLES OF TOPIARY WORK, LEVENS HALL.

maids, and her Crown and Jug, all cut in box ; the Lion, the crest of the Howards, in yew ; the Judge's Wig, formed by several yew trees, and of interest as an illustration of the manner in which the branches interlace, while it is an admirable retreat from the heat of the noonday sun ; and the Peacock, which in its way is specially noteworthy as an example of pruning. The peacock has from the first been a favourite with the verdant sculptors, and they were the last to be banished from gardens in which clipped trees had at one time a prominent position. At Elvaston Castle, Derby, the seat of the Earl of Harrington, the topiary art is admirably represented by trees well-nigh innumerable, and cut into almost endless forms. Here, as at Levens Hall, these quaintly formed trees are immensely attractive to visitors to these famous gardens, and serve to show how important an element is variety in the enjoyment of the garden. At Elvaston birds, animals, arbours, and forms of architecture are represented in great variety, especially interesting being the finely developed peacock and the flock of birds clustering round a coop. Although one could hardly wish to see these fanciful trees multiplied indefinitely, an hour or so spent among them affords much pleasure and interest.



QUEEN ELIZABETH'S CROWN AND JUG, ELVASTON CASTLE.

London and Wise were the two chief exponents of the Dutch style of gardening, and they had a nursery at Brompton Park, which contained, according to Evelyn, a "vast ample collection," that was valued at £40,000. Stimulated by the encouragement given by William III., the topiary art became at the beginning of the eighteenth century so popular that the gardens were crowded with clipped trees, and, as the result of the extravagance in their use, a reaction naturally set in. Addison was the first to take up the pen in condemnation of the artificiality of garden decoration and in advocacy of a more natural style, and his essay "On the Pleasures of the Imagination," published in the *Spectator* (414) in 1712, exercised a material influence in bringing about a much-desired change. Referring to this essay, Mason writes :—

"Addison,
Thou polish'd sage, or shall I call thee bard,
I see thee come : around thy temples play
The lambent flames of humour bright'ning mild
Thy judgment into smiles ; gracious thou com'st
With Satire at thy side, who checks her frown,
But not her secret sting."

In the course of his essay Addison contended that British gardeners of his day, instead of humouring Nature, endeavoured to deviate from it as much as possible. The trees arose in cones, globes, and pyramids, and the marks of the shears were seen upon every tree and shrub. And he states that although he did not know whether he was singular in his opinion, he would much rather see a tree with free spreading branches than when cut into a mathematical figure, and he declares that "an orchard in flower looks infinitely more delightful than all the labyrinths of the most finished parterre.' Addison was not singular in his opinion, for, to again quote from Mason's poem of the "English Garden"—

"With bolder rage
Pope next advances ; his indignant arm
Waves the poetic brand o'er Timon's shades,
And lights them to destruction ; the fierce blaze
Sweeps through each kindred vista, groves to groves
Nod their fraternal farewell and expire."

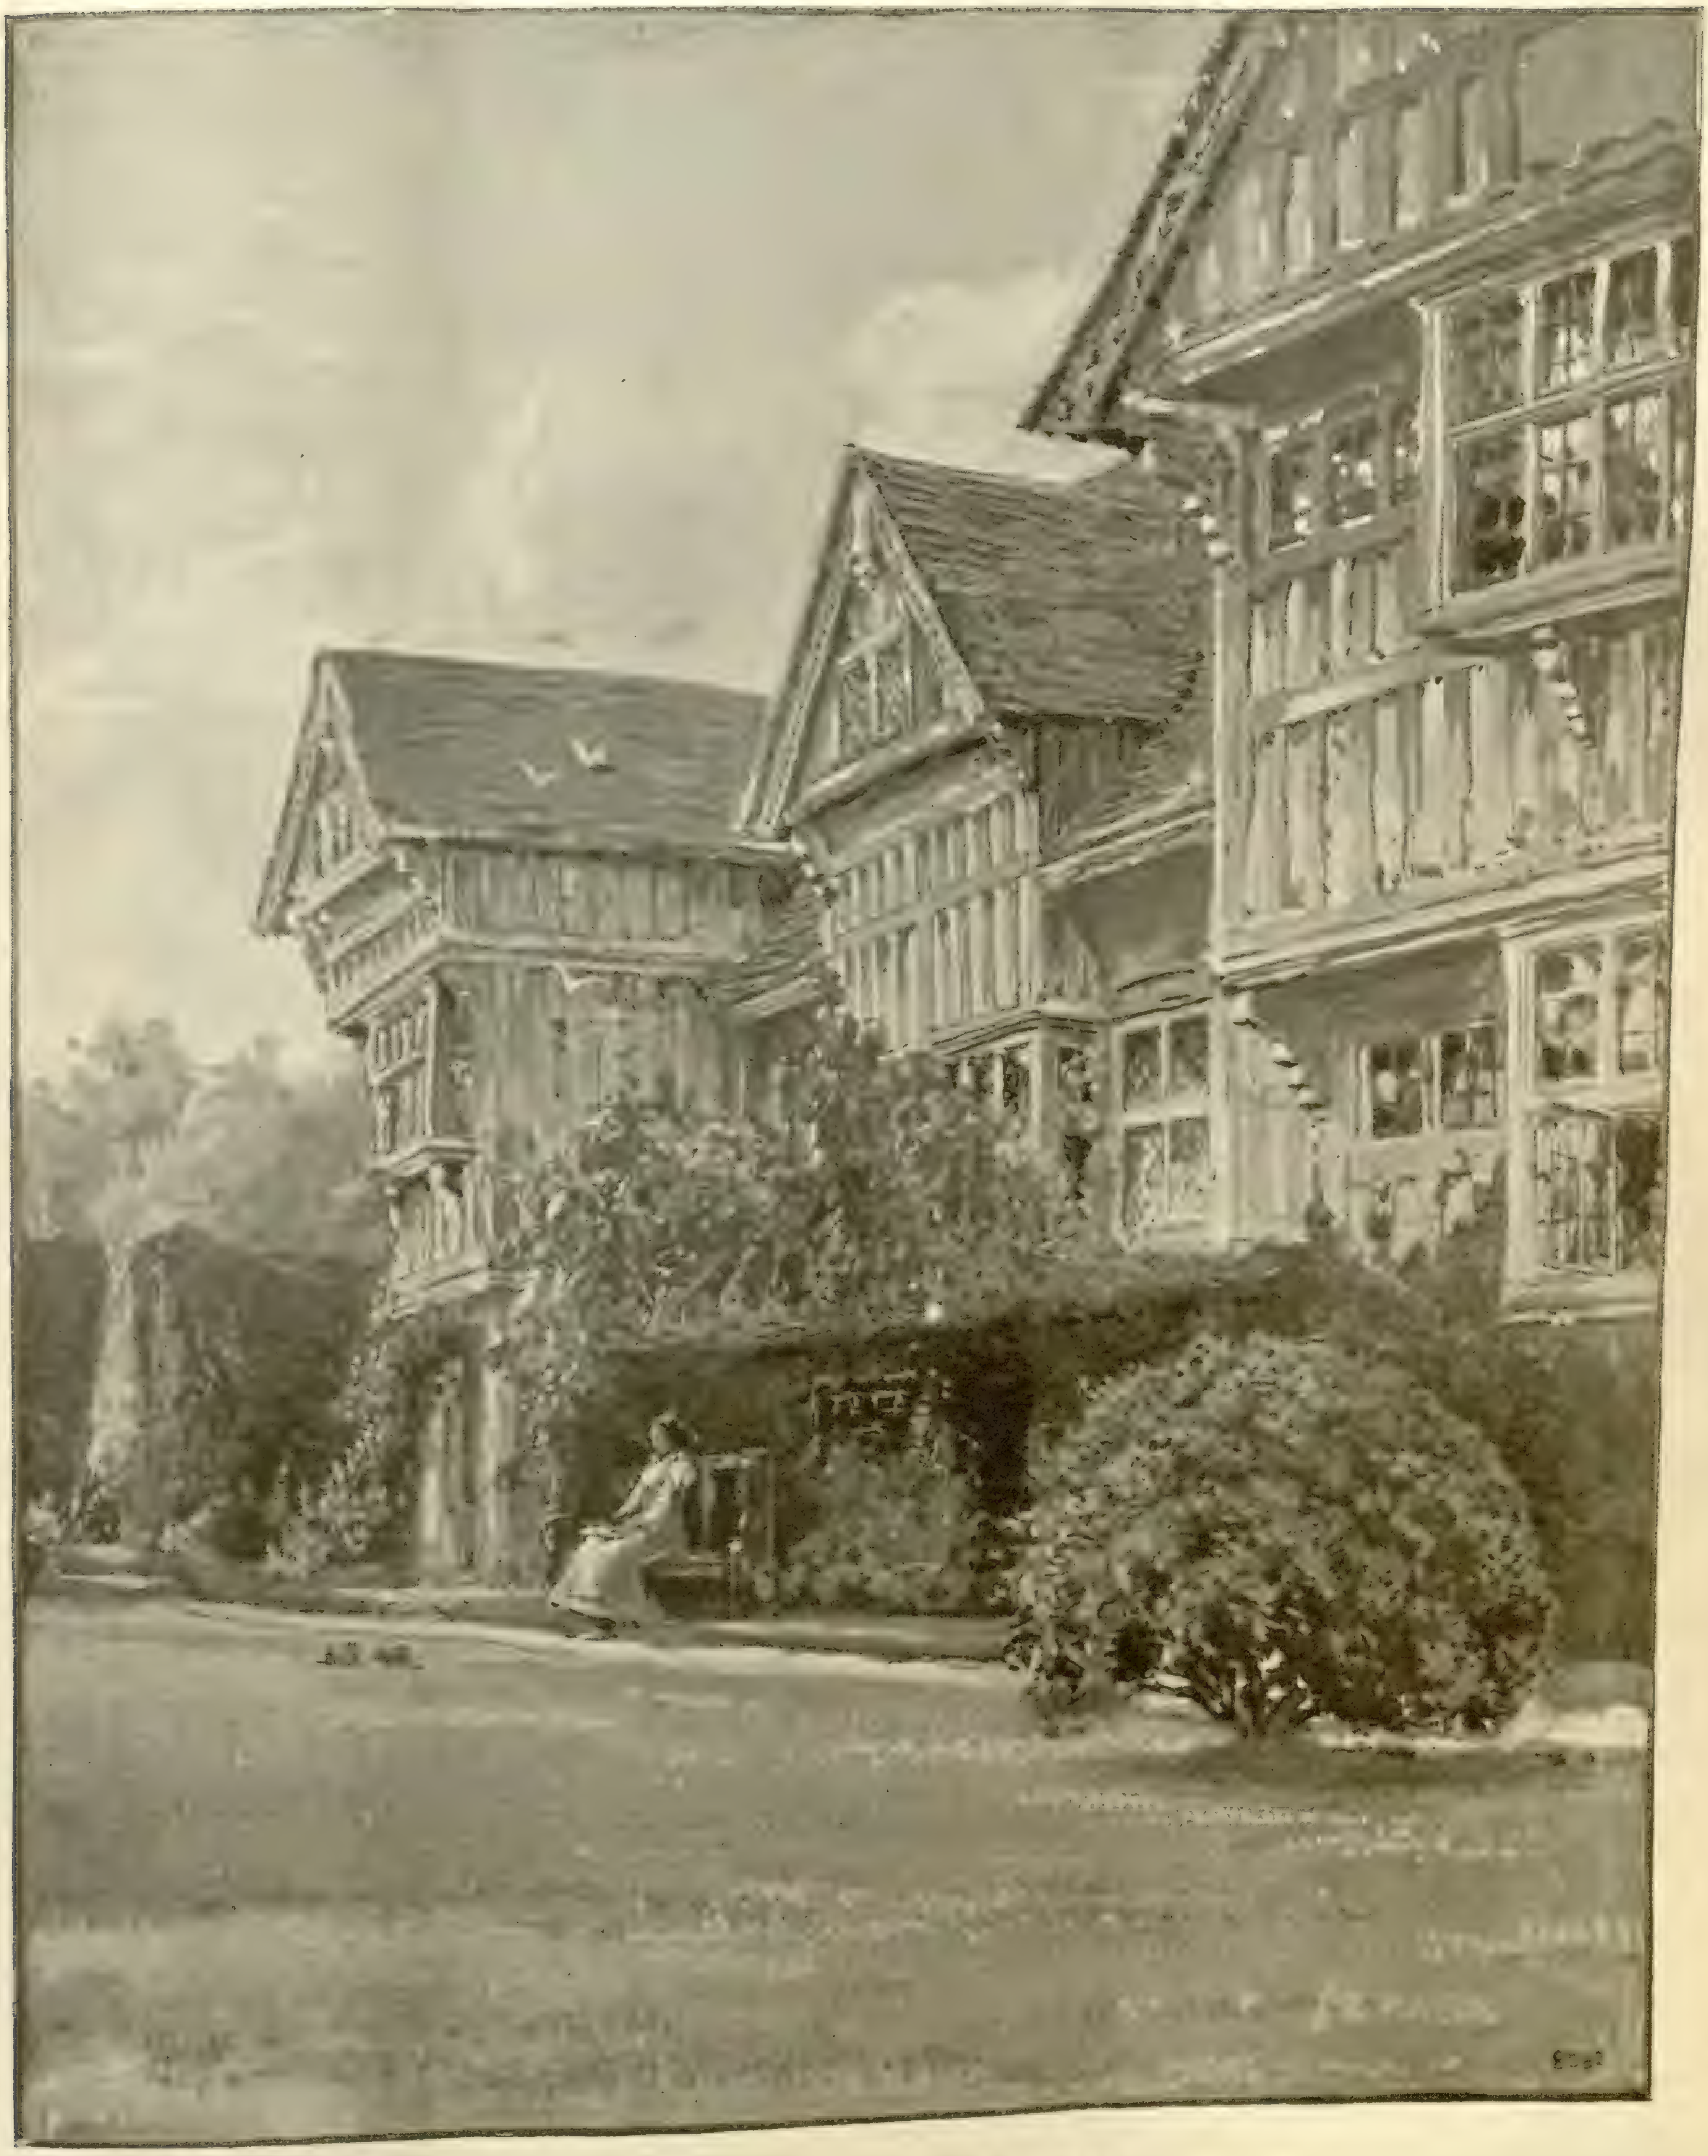
To state the case in more exact terms Pope contributed to the *Guardian* in 1713 an article in which he vigorously condemned the excessive formality which characterised the gardens of the period and the use of clipped trees. "A citizen," he wrote, "is no sooner proprietor of a couple of yews but he entertains thoughts of converting them into giants like those of Guildhall." For the purpose of pouring ridicule upon the practice he gives what purports to be a selection from a catalogue of sheared trees that he had received from "an eminent town gardener," who had "arrived to such perfection that he cuts family pieces of men, women, and children in trees." The items given include "Adam and Eve in yew, Adam a little shattered by the fall of the Tree of Knowledge in the great storm" ; "Eve and the Serpent, very flourishing" ; "St. George in box, his arm scarce long enough, but will be in a condition to stick the dragon by next April" ; "Dragon of the same, with a tail of ground ivy for the present" ; "Divers eminent modern poets in bays, somewhat blighted, to be disposed of—a pennyworth" ; and a "Quickset Hog, shot up into a porcupine by its being forgotten a week in rainy weather." This aspect of gardening is also dealt with by Pope in the fourth epistle of his "Moral Essays," but it is not now possible to do more than quote the following lines :—

"His garden next your admiration call,
On every side you look, behold a wall !
No pleasing intricacies intervene,
No artful wildness to perplex the scene.
Grove nods at grove, each alley has a brother,
And half the platform reflects the other.
The suff'ring eye inverted Nature sees,
Trees cut to statues, statues thick as trees,
With here a fountain never to be played,
And there a summer house that knows no shade.
Here Amphitrite sails through myrtle bowers,
There gladiators fight or die in flowers.
Unwatered see the drooping seahorse mourne,
And swallows roost in Nilus' dusty urn."

Immediately Addison and Pope had made their pronouncements in favour of the natural style, Kent came to the front, and, as the practical exponent of the views enunciated by philosopher and poet, he rapidly acquired popularity, and set his mark upon the great gardens of the country, and wrought a much-desired change. Bridgeman also accomplished much work in the same direction, but there can be no question that, in their desire to produce "natural effects," these two famous andscape gardeners and their followers went to the other extreme, and in opening up gardens they exposed them to the cold blasts from all points of the compass, and deprived them of much of their privacy and enjoyment.

A discussion of the many changes that have been made in garden design since the days of Kent would be out of place, and I will skip a century and a half, and state briefly that there is a tendency to restore some of the screens which formed so characteristic a feature of the Dutch style, with a view to obtain a greater degree of privacy, and more shelter for both visitors and plants. With this restoration of sheltering hedges and verdant belts has evidently come a desire for examples of topiary art, and already there are several modern gardens where they are to be found firmly established. In the flower garden at Ascott, the residence of Leopold de Rothschild, Esq., of which an illustration is given herewith, there are numerous examples. The gardens of Lord Rosebery's residence at Epsom contain a peacock and several geese and fowls, and the newly-formed topiary garden at Friar Park, the residence of F. Crisp, Esq., promises to form one of the most interesting features of the beautiful pleasure grounds, and reproduce a scene familiar in gardens two centuries ago.

* * *



"THE HOUSE WITH THE THREE GABLES."
(From the water-colour drawing by E. A. Rowe.)

PENZANCE SWEET-BRIERS.

WHEN talking a few days ago to a friend who has obtained no small amount of success both as a grower of chrysanthemums and roses, he observed that a grower of the "Golden Flower" had a ceaseless round of work, occupying twelve months, from cutting to show-board, whereas the rose-growing amateur had quite a respectable season of rest from his labours. Said he, "Now I've quite done with roses until pruning time comes again." Quite? All planting, mulching, labelling, staking, &c., done? "Yes, all. Having eaten the N.R.S. annual dinner I've done with roses for the rest of the winter." I smiled, in fact I almost winked, for I had seen an advance copy of the beautiful GARDENERS' MAGAZINE Almanack for 1899, and I knew full well that my friend would have roses with him all the winter in the form of elegant sprays of the lovely Penzance Sweet-briers wreathed around the calendar that in a few days' time will be in its frame and set above the desk in what he is pleased to call his "scribbling den." "The almanack is a success in every way but one," was my remark when the editor displayed this triumph of draughtsmanship and lithography, to which he responded, "What *is* the matter?" in a tone of voice that one seldom hears from so dignified a vice-president of the National Rose Society. Having allayed his fears with respect to the technique of both artist and printer, I humbly suggested that fragrance only was needed, and if, with his colours, the lithographer could have blended the odour of these exquisite eglantines, absolute perfection would have been reached.

How the hybrid sweet-briers were raised by the Right Hon. Lord Penzance at Eashing Park, Godalming; how they have been propagated and distributed by Messrs. Keynes, Williams, and Co., of Salisbury; and how by reason of their robust gracefulness, attractive or delicate colouring, and their delicious fragrance, they have taken the popular fancy by storm, have all been told in these columns by many rosarians, so that repetition at this season is unnecessary. If you have planted, or intend to plant, any of these roses, and are still not quite sure how they should be managed, you cannot do better than refer to Mr. C. G. Wyatt's article on p. 412 of the GARDENERS' MAGAZINE for July 10, 1897. All who have seen fine specimens of any of the varieties will agree with Mr. Wyatt that "the best of all places to plant them is singly and separately on a lawn, with plenty of space on all sides, when the long branches, which have naturally a slightly outward curve, are allowed to grow and blossom just as Nature intended they should do." That's just it. Spenser wrote :—

> "The fragrant Eglantine did spred
> Her prickling armes, embrayled with Roses red,
> Which daintie odours round about them threw;
> And all within with flowers was garnished,
> That, when mild Zephyrus amongst them blew,
> Did breth out bounteous smels, and painted colours shew."

One need not simply indulge in a "Midsummer Night's Dream" of gardens "with sweet musk roses and with eglantine," for the hybrid sweet-briers are not expensive subjects, and, if you have space and wish for variety, you may e'en have not simply "a bush of fragrant eglantine," but sixteen bushes, and each one of a different variety, and producing variously coloured flowers. Do you wonder whether the Penzance briers will make a good hedge? Yes, most decidedly yes; but be careful how you mix the colours, for, "if mixed, the rich coloured varieties cause the paler tints to have a faded, washed-out appearance." With this proviso you may certainly have

> "Hedges flowered with eglantine"

such as Smollett had no conception of, and if you are the owner of broad acres, or only have the "three" which a certain statesman is said to have once proposed to allot us, you may experience at certain seasons, if you will, the wish of the poet Thomson—

> "Oft let me wander o'er the dewy fields,
> Where freshness breathes, and dash the trembling drops
> From the bent bush, as through the verdant maze
> Of Sweet-brier hedges I pursue my walk."

MODERN EXAMPLE OF TOPIARY WORK, ASCOTT.

Shades of rose are well represented in the Penzance sweet-briers, or we have Amy Robsart, deep rose; Edith Bellenden, pale rose; Rose Bradwardine, clear rose; Catherine Seyton, rosy pink; Flora McIvor, white, tinted with faint rose; and Green Mantle, rose, with a white centre. Some exquisite shades of colour are provided by Brenda, peach; Julia Mannering, pearly or silvery pink; and Lord Penzance, fawn. Very light and delicate are Lucy Ashton, white, pink edged; Minna, almost white, but with a blush tint. More brilliant varieties are Anne of Gierstein, dark crimson; Jeannie Deans, crimson, and semi-double; Meg Merrilies, a splendid crimson; Lucy Bertram, crimson, with a contrasting white centre; and last, but not least, of the sixteen, Lady Penzance, bright coppery yellow. Please make your own choice, with the almanack to help you if need be. Give your plants the best possible position and encouragement, for, as Dean Hole has said, if you would have good roses in your garden you must have good roses in your heart. What is worth doing is always worth doing well. Spenser says :—

> "Sweet is the rose, but grows upon a brere;
> Sweet is the junipeere, but sharpe his bough;
> Sweet is the eglantine, but pricketh nere;

* * * * *

> "So every sweet with soure is tempred still,
> That maketh it be coveted the more;
> For easie things, that may be got at will,
> Most sorts of men doe set but little store."

KARL PROSPER, JUN.

SUB ROSA;

OR,

THE PRETTY BOUQUETIÈRE.

I WAS sitting one evening, some years ago, as was often my custom, outside a café in the Boulevard des Italiens, in Paris, sipping quietly a cup of coffee following on my dinner. At the time my thoughts were unoccupied. I was listless, and sat hardly conscious of the surroundings; the cool air and blue sky, the white houses, and the crowd of pedestrians out for their usual quiet stroll and cheap enjoyment, for surely a carafe of fresh water and a lump or two of sugar, with, perhaps, a soupçon of fleur d'orange, that favourite beverage of the abstemious French, is not a prohibitive luxury. Whilst in this mood I suddenly became conscious that I was an object of regard to a pair of black, piercing eyes, whose fair owner a moment later dexterously decorated my buttonhole with a rose. A gentle voice addressed me, belonging to one of the many bouquetières who flutter along the boulevards like so many butterflies, with this difference, however, that they turn their brilliant-hued flowers to a very practical account. Following the example of some other loungers like myself, who were similarly treated by the fair nymph, I put a silver coin into her hand, and thought myself extravagantly rewarded when I received a sweet smile and the pretty verbal acknowledgment of "Merci bien, m'sieu."

To meet a perambulating and irresistible bouquetière, who places a flower in your coat, and regards you smilingly as she attends for her reward, is hardly a rare occurrence in Paris; but I was greatly interested, unaccountably so, in this pretty girl, for her manner and bearing, I could but remark, were very different from most others of her calling. Without anything theatrical in her appearance she was yet such a being as one can scarcely realise out of a ballet. Not that her dress was unconventional, save, perhaps, in its coquettish simplicity, and the smart ribbons which gave such a character to the little cap perched so jauntily on her head. Evening after evening I saw the same girl, generally near the same spot, and, as may be readily imagined, became one of her regular clientèle. I learned, too, as many facts relating to her as one could learn where most was mystery. Her peculiar and persuasive mode of disposing of her flowers was her own graceful, original idea. It was something new and natural, and whilst pleasing many offended none. Even the surliest of old stockbrokers could not refuse being decorated by such fair, nimble fingers. Accordingly she soon found herself positively famous. Much discussion arose concerning her name and where she lived. Many an adventurous student traced her footsteps hour after hour, only to lose sight of her at last.

She always contrived to mysteriously disappear. Other stratagems failing, it often occurs to the curious to ask a direct question; but in the present case this was next to impossible. Gabrielle, for so was she called, by what authority, I know not, was only seen in the most public places, and to exchange many words with her was considered a feat. Notwithstanding her strange wild way of gaining her living, there was a dignity in her manner which sufficed to cool the too curious. It soon came to pass that, being so attractive a personality, managers of cafés chantant were not slow to see money might be made out of her, and it was said she was offered and rejected many lucrative engagements. She treated these offers with the most glorious contempt. There was, indeed, something realistically dramatic in the bouquetière's disdain of the drama. She, who lived a perfect romance, could never descend to act in one. It may well be supposed that where so much mystery existed imagination would not be idle. To have believed the conflicting stories told about her would be to arrive at the conclusion that she was the stolen child of noble parents, brought up by an honest ouvrier. Some said her reputed father was a tailor of dissolute habits, who now lived on her industry, that her mother was a deceased duchess. Others denied her grace's death, and stated that she, under a false name, carried on a flourishing business as a blanchisseuse. As for the private life of the young lady herself, it was reflected in such a magic mirror of contradictory impossibilities, in the delicate discussions held on the subject, that one had no choice but to disbelieve everything.

One day a fresh fillip was given to gossip by the appearance of the bouquetière in a positively chic hat of some expensive straw, and made in a style bordering on the ostentatious. It was not doubted but that the profits of her profession would allow of such an expenditure, but in Paris the adoption of a bonnet or hat, in contradistinction to the little cap of the grisette, is considered the assumption of a superior grade, and unless warranted by the position of the wearer is resented as an impertinence. In Paris, indeed, there are but two classes of females, those with bonnets and those without; or, as has been wittily said, the powers that be, and the powers that want to be. No French bonne would, in her wildest dreams, ever think of emulating her mistress in her dress or head garniture, as Mary Jane and her sisters do, as a matter of course, in our own land. Surmises were many and marvellous. Was she becoming proud, becoming a lady? But how, why, where? Curiosity became rampant, and scandal more inventive than ever. But soon a positive catastrophe took place.

"One morn we missed 'her' in the accustomed spot"—to employ the language of poetic licence. Not only, indeed, all accustomed and probable spots, but the unaccustomed and improbable ones, even impossible spots, all of which were duly visited. In short, she was not to be found at all. All was positive amazement on the boulevards, the most hardened old flaneur turned pale, and the moustachios of the jeunesse drooped. Soon, however, a new sensation was provided for the sentimentalists of the boulevards, and the affair of the fair flower-girl was relegated to the past as a nine days' wonder.

A few months later I found myself one evening at one of those famous and brilliant receptions for which Paris is so renowned. However, in all the gay excitement prevailing, I felt unaccountably dull, and was making for the door—with a view to my quiet departure—when the fair hostess detained me for the purpose, as she whispered, of presenting me to a lady who was monopolising all the attention of the evening. She was the newly-made bride of a young baron of great wealth who was noted for a certain wild kind of genius and an utter scorn of the conventionalities of high life. The next moment I was introduced to a beautiful young lady whose brilliant eyes there was no mistaking—it was Gabrielle, the bouquetière!

I took a chair at the side of the pair, and entered into conversation. The Baronne observed that she had met me before, but could not remember where. Almost in the same breath she asked if I was a lover of flowers. I muttered something, intended as a compliment, about loving beauty in any form, and admired a bouquet she held in her hand. She selected a spray of roses, La France, and said was it not a fine specimen. I delightedly assented, and the spray not being redemanded, I did not return it. The conversation turned to the topics of the day, and soon after the Baronne and her husband took their leave. They were departing the next day, I casually heard, for the family estate.

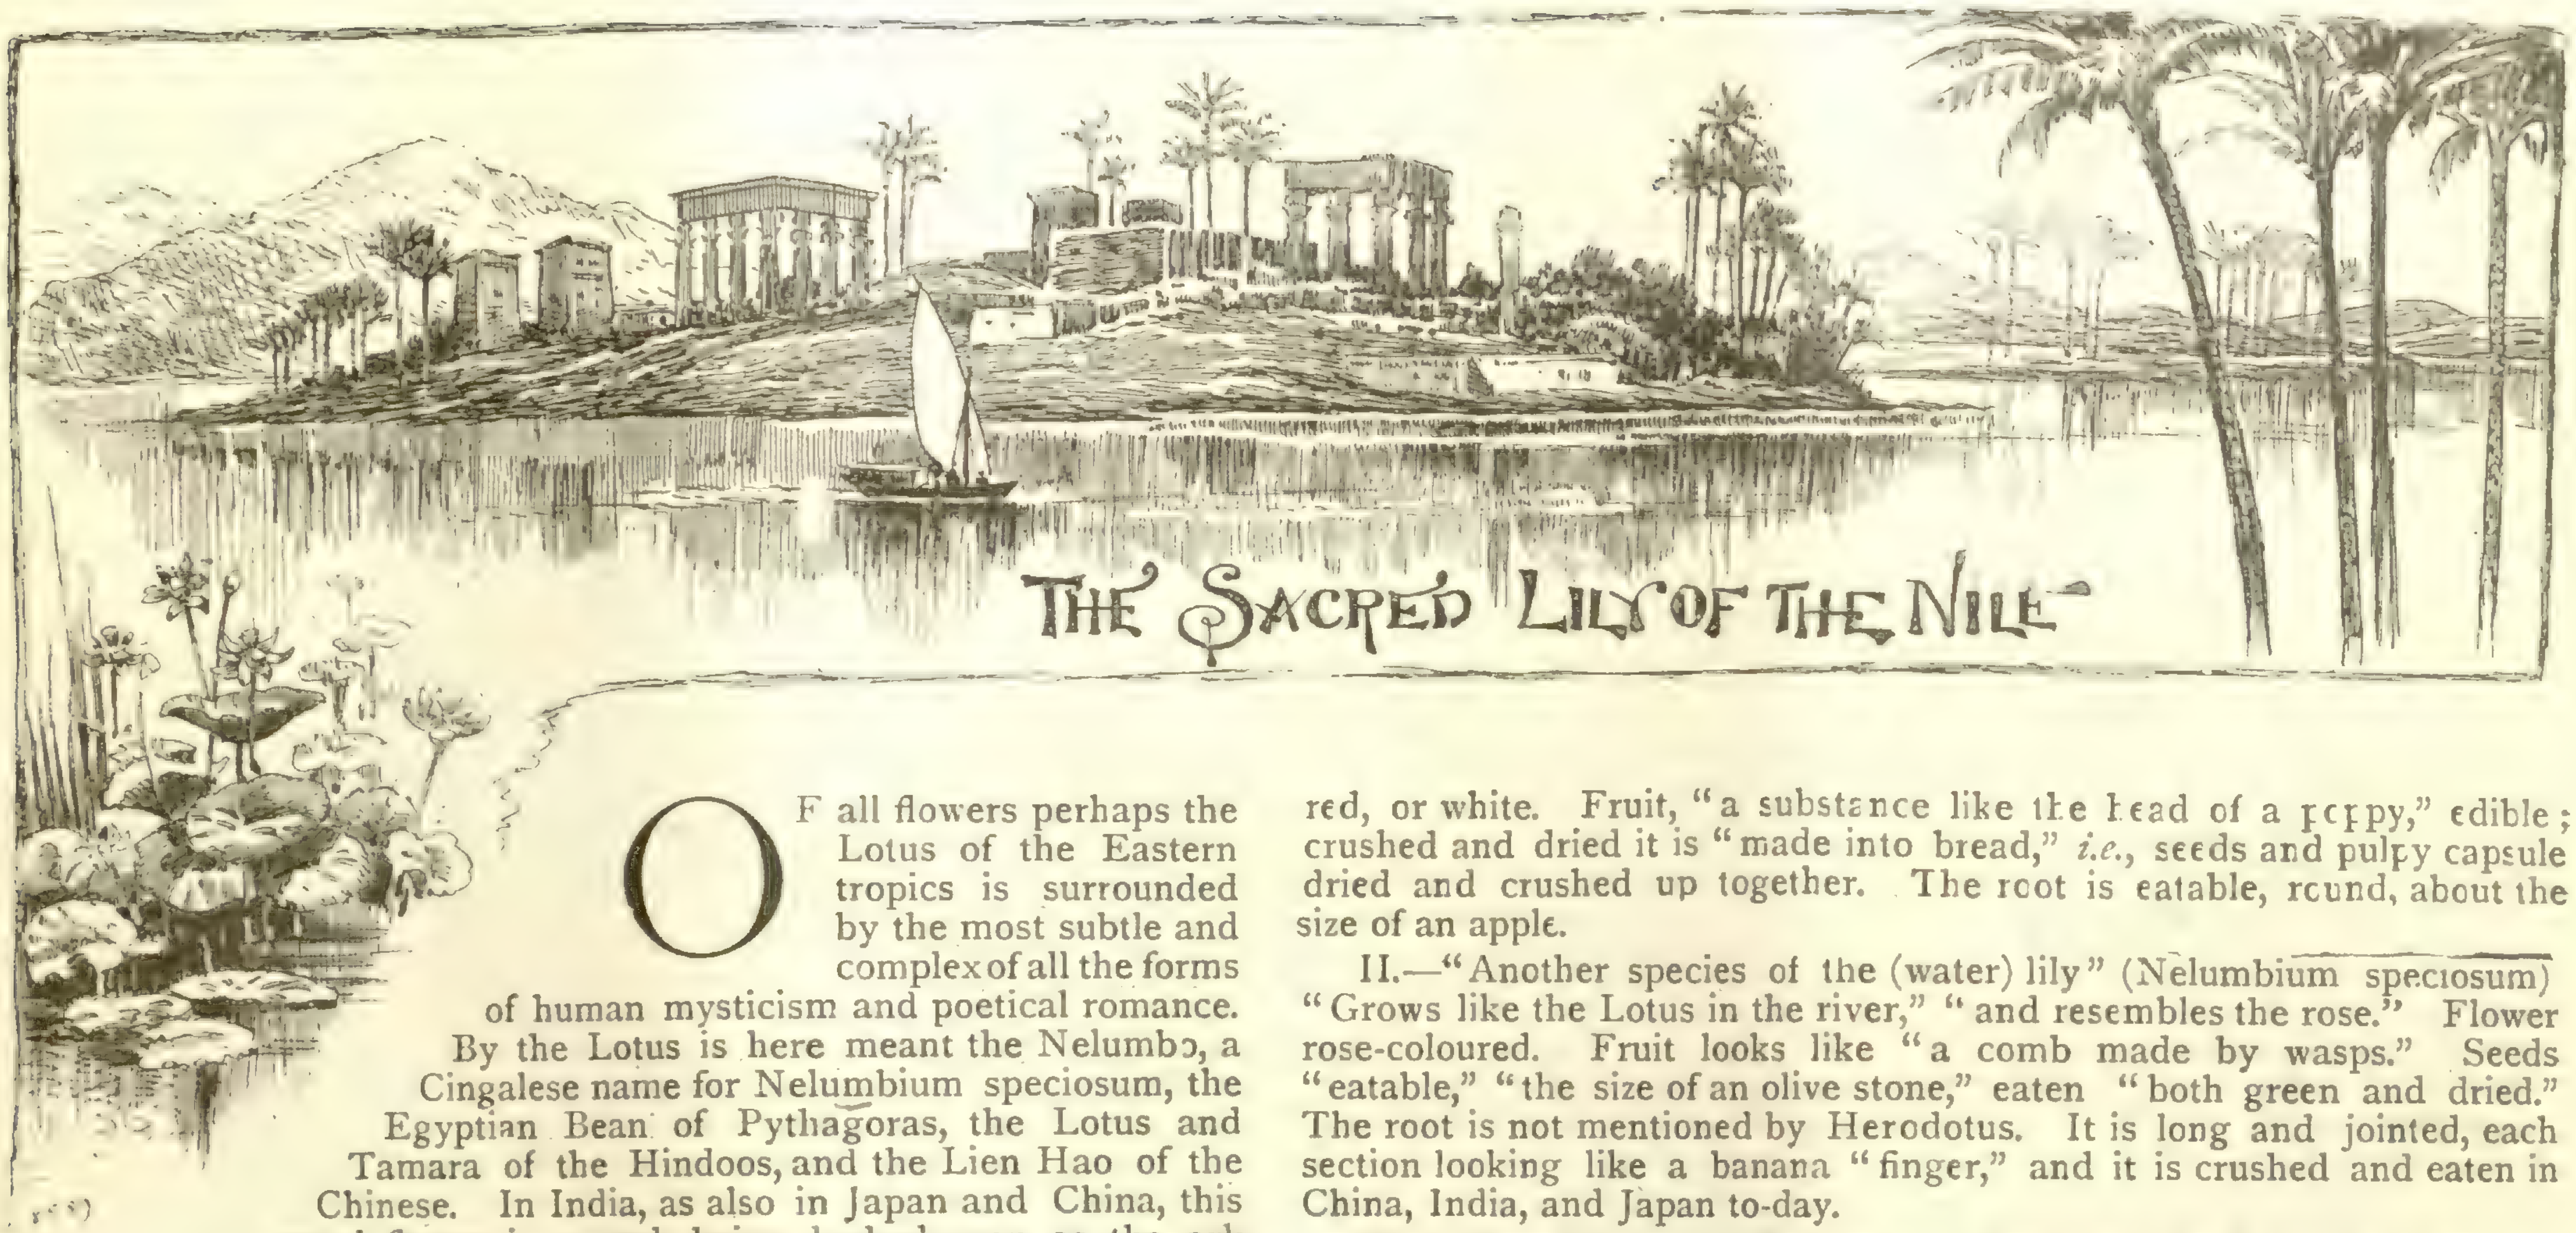
I learned subsequently that some strange stories had circulated regarding the previous life of the Baronne. Whatever they were they certainly speedily increased the calling and status of the bouquetière, and made it inconveniently popular. Young ladies of all ages, even, too, of a certain age, suddenly adopted it, and intruded their flowers with dreadful pertinacity upon inoffensive loungers, making war upon unoffending button-holes that had never done them harm. A fixed idea found favour that this practice was the road to a rich and noble husband, hence its being adopted with such enthusiasm. To-day, however, it hardly continues in vogue, having presumably proved a failure. I had almost forgotten to mention that the day after my meeting with the Baronne some friends called on me, to whom I was about to narrate my little adventure, when an incident took place which decided me not to do so. One of them admired my spray of roses, which I had preserved in a flower glass. An idea struck me.

"You know the language of flowers?" I asked him. "The rose is the emblem of love, is it not?"

"Yes," he replied, "but yours is a rose and a pair of rose buds—the emblem of *Secrecy*. You have, doubtless, another affair of the heart on hand; be careful you don't betray the fair one."

I was struck with amazement, and fell from my paradise of love to the realities of the situation. However, I am glad I was discreet enough to hold my tongue. The events narrated above occurred during the Third Empire.

WM. NORMAN BROWN, F.R.H.S.



THE SACRED LILY OF THE NILE

OF all flowers perhaps the Lotus of the Eastern tropics is surrounded by the most subtle and complex of all the forms of human mysticism and poetical romance. By the Lotus is here meant the Nelumbo, a Cingalese name for Nelumbium speciosum, the Egyptian Bean of Pythagoras, the Lotus and Tamara of the Hindoos, and the Lien Hao of the Chinese. In India, as also in Japan and China, this regal flower is sacred, being looked upon as the ark or floating shell of Vishnu, and the throne of Brahma, and even in Thibet temples and altars are embellished and perfumed by its flowers. How it came to be cultivated so largely in Egypt in ancient times is not now known, but the probability is that it was originally brought from the East as a food plant, and then afterwards became extremely popular, and was very highly valued for its beauty, so highly indeed as to become almost sacred, and it was grown extensively in canals and tanks adjoining the temples and palaces, much as we see it in Ceylon, Persia, Cashmere, Thibet, China, Japan, and Korea to-day. That the Nelumbo has been sacred from time immemorial in the East is well known, and in both Asia and Africa its rhizomes, leaf and flower stalks, and its seeds long have been and still are highly valued as food, much as the fleshy roots of Asphodel were valued in ancient Greece.*

Now let us for once and all get a clear view of all

THE LOTUS LILIES.

LATIN NAME.	POPULAR NAME.	NATIVE COUNTRY.	COLOUR OF FLOWER.
Nymphæa Lotus	Egyptian Lotus	Africa and Asia	Rosy red or white
,, stellata... ...	Blue Lotus	Tropical Africa and Asia	Blue
,, cærulea ...	Cape or African Lotus	Cape of Good Hope and Tropical Africa	Blue
Nelumbium speciosum...	Indian Lotus, or Lotus of China and Japan. "The Rose of Egypt," or Egyptian Bean	Asia and Tropical Africa	Rose, peach, deep red, flesh, and white, in many forms or variations
,, luteum ...	West Indian and North American Lotus, or Water Chinquapin	West Indies and South United States	Primrose or clear lemon yellow, rarely white

Volumes might be written about the Nelumbo, or Flower of Buddha, and on the controversies that have taken place as to the meaning of the word Lotus, and the actual identity of the plants to which the name Lotus has by ancients and moderns been applied. The Nelumbium, in one or other of its lovely forms, is found all over the East, in Ceylon, India, China, Japan, the Malayan Archipelago, the Philippines, Persia, and Cashmere, and it even extends to the shores of the Caspian Sea. Both Strabo (B.C. 54—A.D. 24) and Theophrastus (B.C. 374—285) mention it as being native of Egypt, and its form and contour, in both bud and blossoming, is very often represented on the capitals of columns, chapiters, and other details of both Indian and Egyptian architecture; but I do not believe that the Nelumbo was ever indigenous to the Nile Valley. That it was grown and highly valued there, both for use and ornament, is quite true, but facts point to its having been an introduction that became naturalised. As to this plant in Egypt, Herodotus (B.C. 484-406) says: "There is another species of the lily in Egypt, which grows, like the Lotus, in the river, and resembles the rose. The fruit springs up side by side with the blossom on a separate stalk, and has almost exactly the look of a comb made by wasps. It contains a number of seeds about the size of an olive stone, which are good to eat, and these are eaten both green and dried."

THE EGYPTIAN WATER LILIES OF HERODOTUS.†

I.—"A certain water lily," Lotus (Nymphæa Lotus). Flower rose-red, or white. Fruit, "a substance like the head of a poppy," edible; crushed and dried it is "made into bread," *i.e.*, seeds and pulpy capsule dried and crushed up together. The root is eatable, round, about the size of an apple.

II.—"Another species of the (water) lily" (Nelumbium speciosum) "Grows like the Lotus in the river," "and resembles the rose." Flower rose-coloured. Fruit looks like "a comb made by wasps." Seeds "eatable," "the size of an olive stone," eaten "both green and dried." The root is not mentioned by Herodotus. It is long and jointed, each section looking like a banana "finger," and it is crushed and eaten in China, India, and Japan to-day.

That Herodotus actually saw and described the Nelumbo there can be no doubt, the wasp's nest-like seed vessel settles that; but he is careful to distinguish it from the true Lotus of Egypt, viz., Nymphæa Lotus, which is an undoubted native, being found there in abundance to this day. The Lotus (N. Lotus) is often found in the hieroglyphs, where it stands as a symbol for the Upper Country or Southern Egypt. Its roots and seed heads are still eaten by the residents near to Lake Manzaleh, and the rivulets and shallow pools near Damietta abound with this exquisitely fragrant flower. There are red or rosy and white varieties, and it seems to have been the rose of Egypt, the national flower in old times, and was given to visitors to smell or made into wreaths and garlands for the professional beauties of the time.

The description that Herodotus gives of it is this: "For greater cheapness of living the marshmen practise certain peculiar customs, such as these following:—

"They gather the blossoms of a certain water-lily, which grows in great abundance all over the flat country, at the time when the Nile rises and floods the regions along its banks—the Egyptians call it the Lotus—they gather, I say, the blossoms of this plant, and dry them in the sun, after which they extract from the centre of each blossom a substance like the head of a poppy, which they crush and make into bread. The root of the Lotus is likewise eatable, and has a pleasant, sweet taste; it is round, and about the size of an apple."

Rawlinson adds a footnote stating that the "Nymphæa Lotus grows in ponds and small canals in the delta during the inundation, which are dry during the rest of the year, but it is not found in the Nile itself. It is nearly the same as our white water lily."

Though the N. Lotus and N. stellata, &c., were favourite flowers of Egypt, there is no evidence of their having been sacred; they were always presented to guests at an Egyptian party, and garlands of these sweet flowers were put round their heads and necks. Both the pink and white flowered N. Lotus, and also the blue N. stellata or N. cærulea, are illustrated on Egyptian monuments. There are drawings existent on rolls of papyrus in the library of Trinity College, Dublin, and elsewhere, that might have been made yesterday in Japan, so true and life-like are they in form and colour. Here one sees the Lotus flowers either held in the hand for smelling, or fixed in a kind of clip on a small table or altar before the principal characters in the scenes shown. On these rolls of Nile reed you see sacrificial oxen, with mitre-like crowns and garlands, the ibis, and sparrow-hawks, and here and there the papyrus plant itself, with its tasselled crown, is well shown. These drawings are supposed to be nearly, if not quite, four thousand years old, and though they show that both the papyrus and the Nelumbo were grown in Lower Egypt over two thousand years B.C., yet we know that neither is truly indigenous there to-day, a fact that may suggest that they were cultivated products always, and not truly denizens of the marsh country where they were grown.

Apart from drawings on the papyri, however, there are the actual dried flowers of Nymphæa Lotus, and of N. stellata (so-called blue Lotus), taken from funeral or votive wreaths in tombs four thousand years old at Dier-el-Bahara, and from the mummy cases, or graves of Ahmes I. and Rameses II., and now in the museum at Cairo.

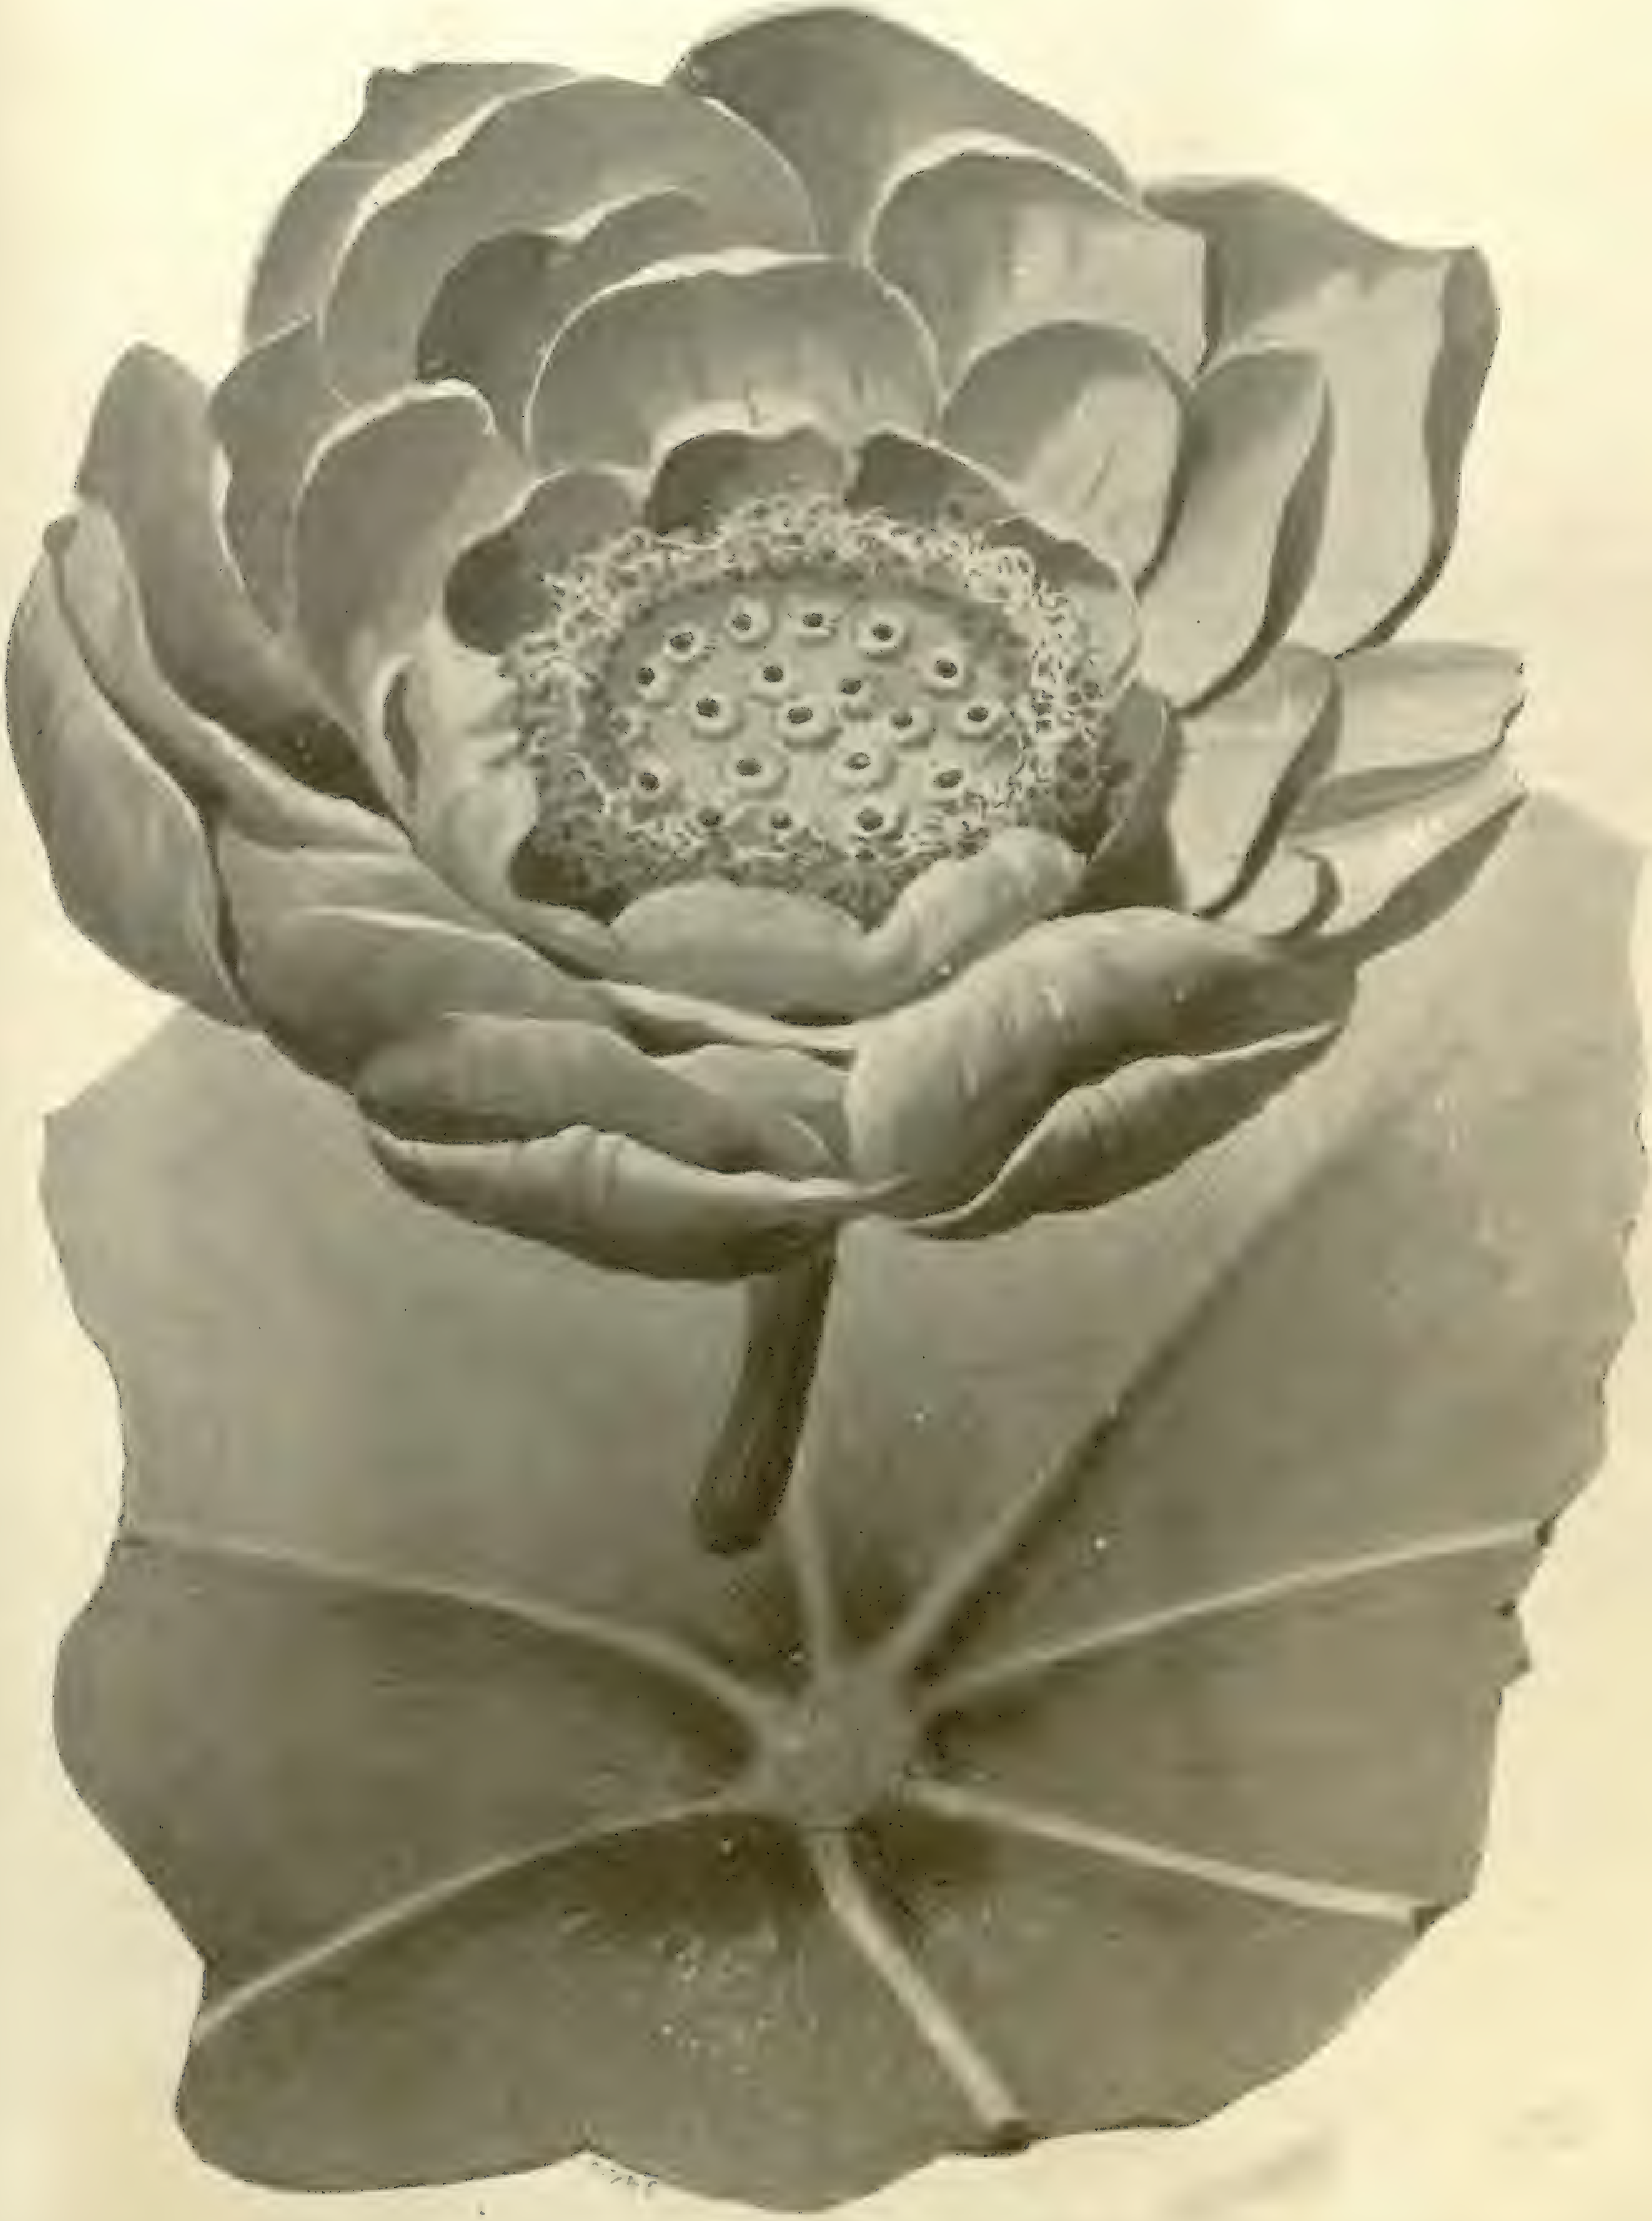
In a room of the great temple at Karnac, in Thebes, are sculptured portraits of plants that Thothmes III. brought home from "the Holy Land, or Ruten, when he went to conquer it." Here are "water lilies as high as trees . . . . all sorts of trees, shrubs, leaves, flowers, and fruits." Are these tall water lilies Nelumbiums? Thus we see that it appears as if the true Lotus of Egypt (Nymphæa Lotus) was not sacred, though undoubtedly highly popular, but that the Eastern Lotus, or Nelumbo, became valued in Egypt after its introduction, just as it had been in the East from time immemorial. In a word, the wise old Egyptian priests and scribes seem to have been like human nature everywhere, in attaching a higher value to things introduced, or "brought

---

* The so-called "Nile Lily, *Richardia æthiopica*, is from South Africa and Cape of Good Hope, and is not wild in Egypt.

† That Herodotus was not much of a botanist, though most observant, is shown by his saying in the case of the Nelumbium, "The fruit springs up side by side with the blossom on a separate stalk."

Supplement to the Gardeners' Magazine, December 17, 1898.



NELUMBIUM SPECIOSUM. (Flower natural size.)

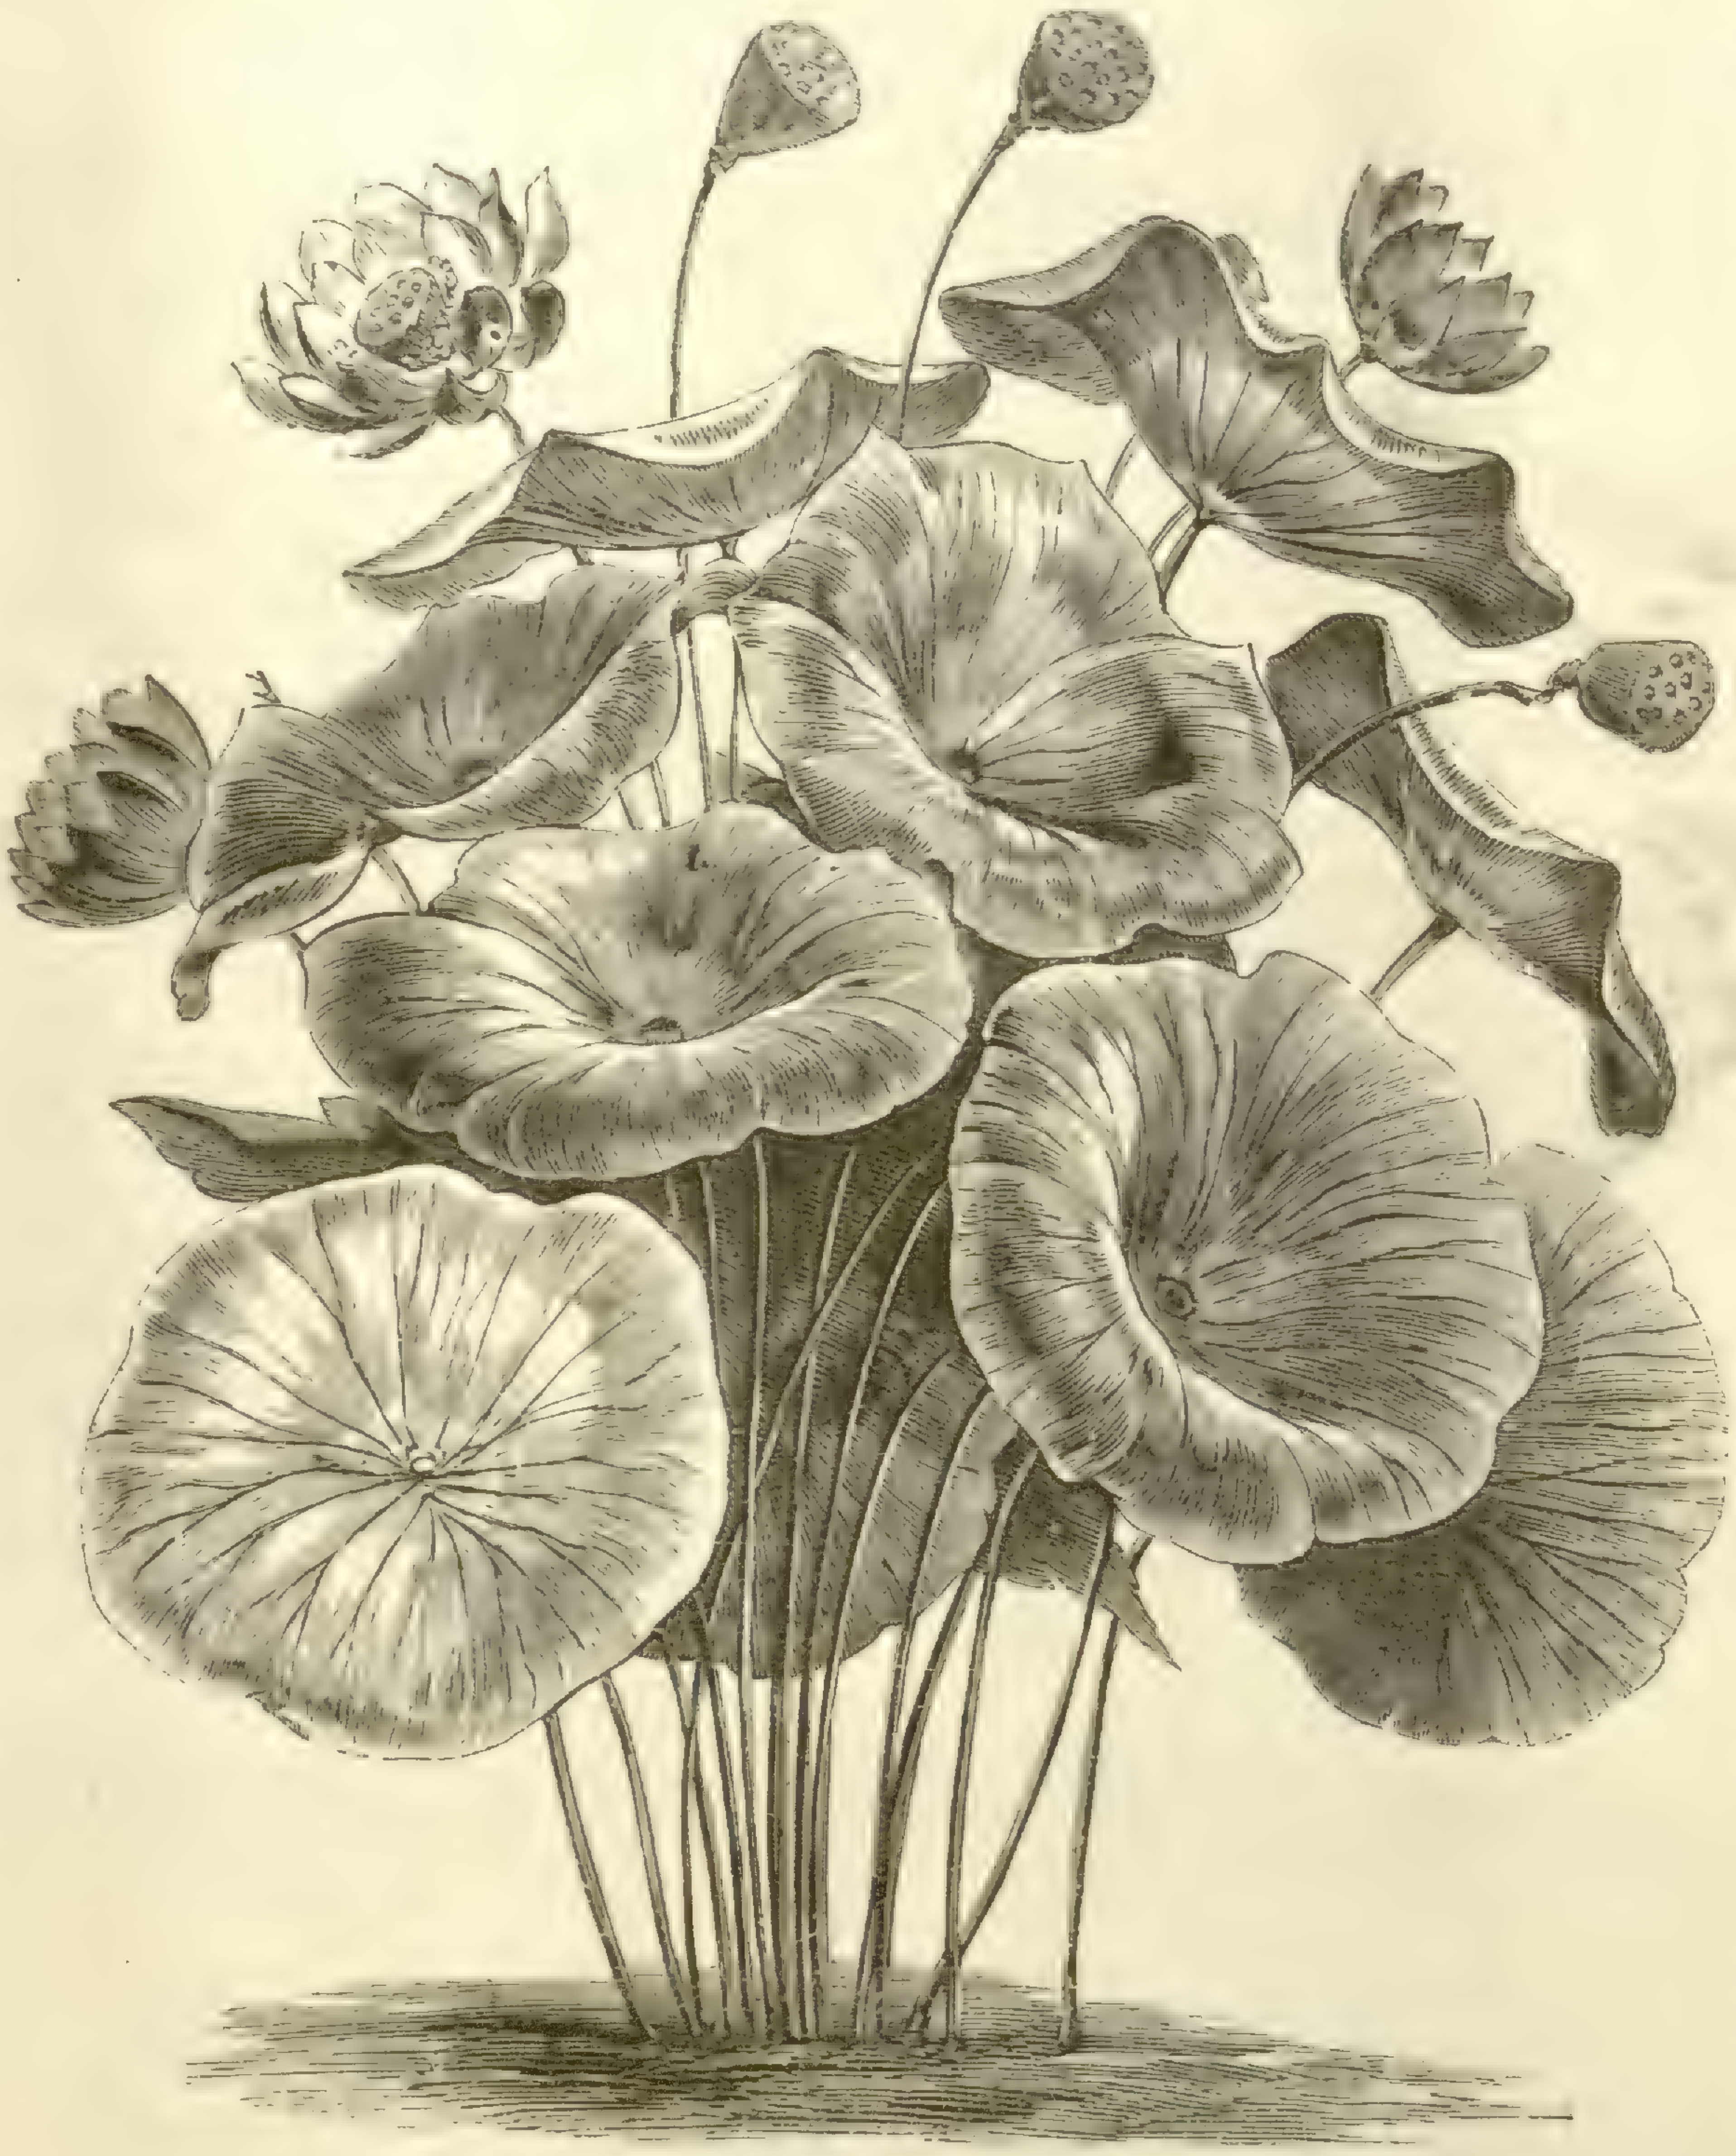
from afar off," than they did to the marsh plants and aquatics of their own land.

The rhizomes of the Nelumbo are jointed and of a pale cream or old ivory-like colour, not unlike banana fingers in general appearance, and they are cooked and eaten in various ways in China to day. These rhizomes also abound largely in starch, and a kind of arrowroot is made from them by the Chinese, and this as powdered up in milk or water makes an excellent light but nutritious vegetable soup. The leaf-stalks and flower-stalks also are boiled and eaten like greens, with oil, or condiments, or sauces of various kinds. From the leaf-stalks soft spiral threads or fibres are obtainable, and these are used as lamp wicks in the temples. The seeds are about the size and in colour not unlike the acorns of the Evergreen Oak (*Quercus Ilex*). They are even more delicate than almonds in flavour, and are eaten either raw or cooked, and roasted, or in various confections.

The old Egyptian method of sowing the seeds of the Nelumbium was to wrap each seed up by rolling around it a flattened ball of stiff clay, which, when thrown into the water, sank and carried the seed to the bottom of tank or pool, and it shows how slowly customs alter, or else from whence the custom originally came, since the self-same method is employed in India and in China to-day. A friend tells me that one of the sights from the walls of Canton, Pekin, and other Chinese cities and towns is the watery moats and pools or canals covered with the platter-like leaves and soft white, cream, or rosy flowers of the Nelumbium.

The open, parasol-like foliage of this plant is covered with a layer of the finest and softest hairs or down, which give an exquisitely soft, velvety appearance to them. At night the dew is condensed in or on these fresh, soft green platters, and when the sun rises the drops glitter like molten silver, or sparkle like diamonds, and the same thing takes place in the open chalices of the flowers. If a leaf be touched ever so gently the dewdrops run about like quicksilver and reflect the sun's rays like precious stones. Hence comes the Eastern proverb that the good and virtuous man is like the leaf of the Lotus, which growing in mud and slime, or dirty water, is always clean. So the upright man is not affected by the dirty waters of temptation, from which he emerges with pure hands and a clean heart.

In the French Salon of 1885 I was much struck by M. E. Richter's picture, nobly painted, of a dainty Persian lady fondling a lute with one hand, while she contemplates a flower of Nymphæa Lotus held in the other. "Sweetness and light," personified in lovely woman and in lovely flower, the jewel in the Lotus, "Om mani padme hum!"



NELUMBIUM SPECIOSUM.
Showing Habit of Plant.

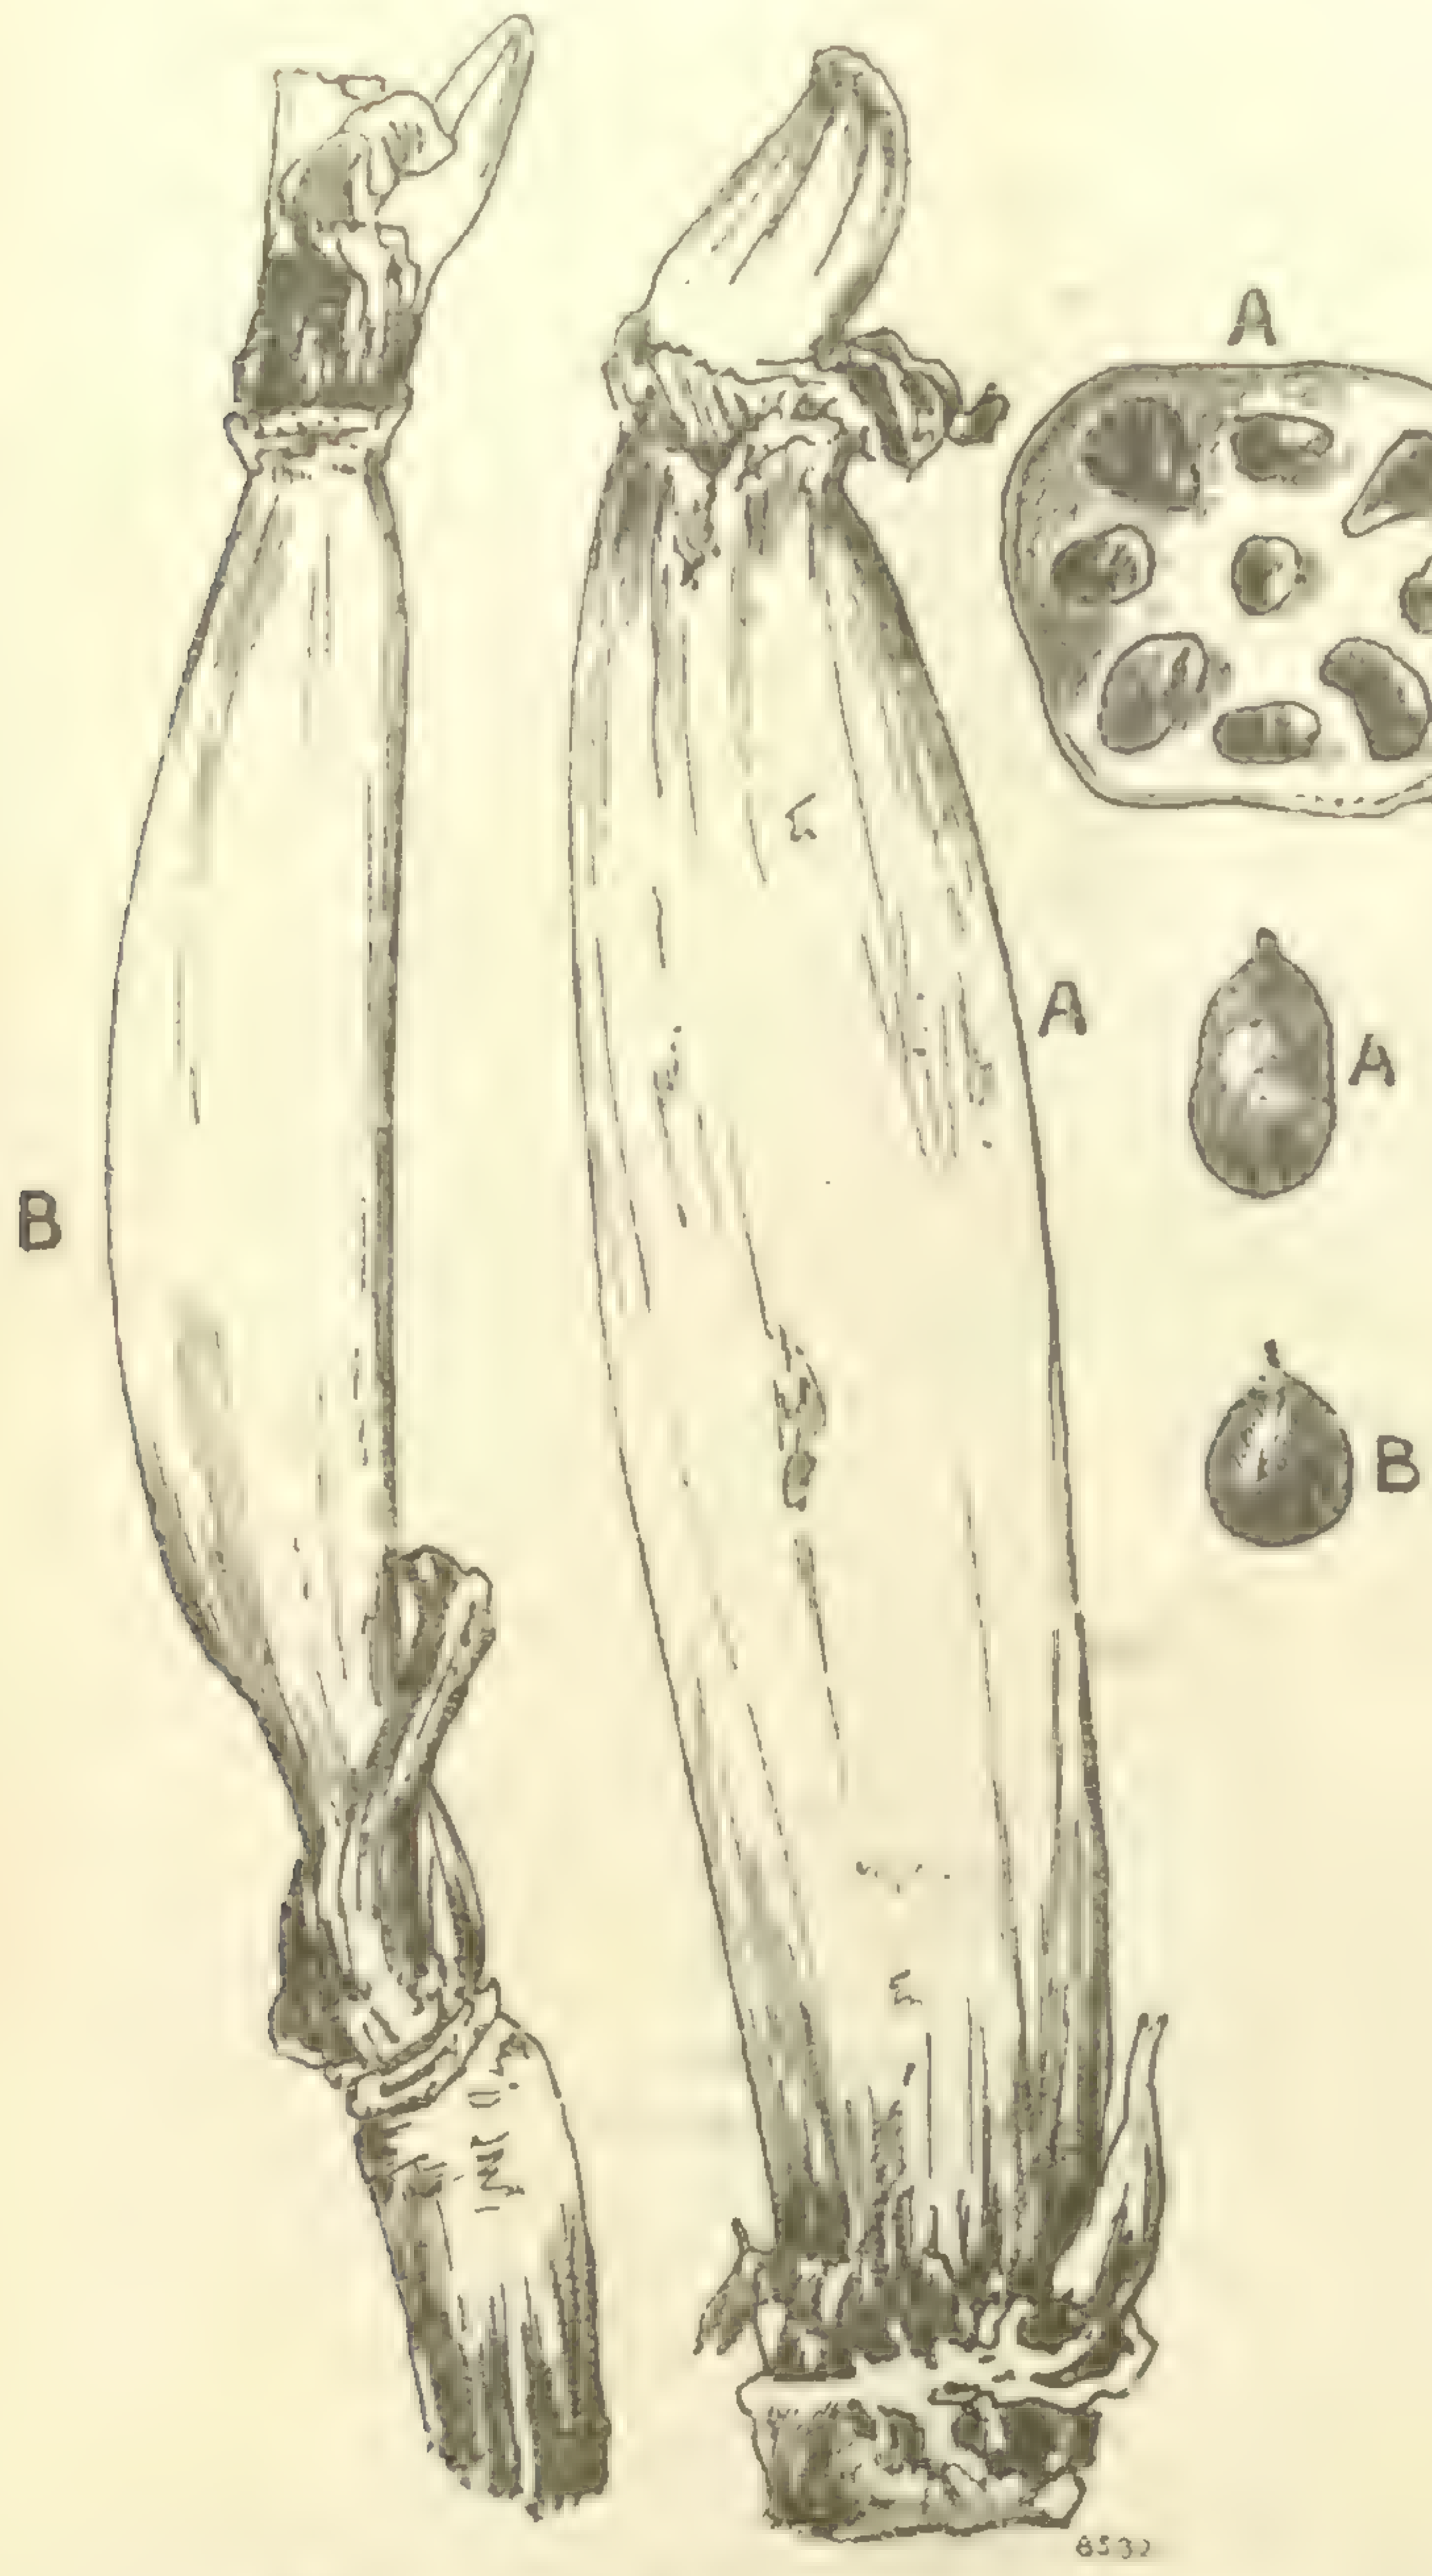
It is one of the delights of one's existence in the tropics to see Nelumbium speciosum in bud and bloom in the fresh cool morning air. I have seen many beautiful tropical flowers in the open air and under God's blue sky, but I shall never forget getting up at or before gun-fire in Singapore, in order to drive out and breakfast with Consul Whampoa, C.M.G., at his residence on the outskirts of the city. I reached the entrance of his compound as the sun rose, and there was dew on every leaf, and stalk, and flower. Palms and bamboos and bananas towered overhead. Over the walk was a covered way, or pergola, on which stephanotis, allamanda, Thunbergia, jasmine, and other fragrant stove shrubs and climbers were trained here neatly and trimly, and there dangling in wild and luxuriant abandon and profusion almost to the ground Stifflia chrysantha, ixoras, crotons, coloured dracænas, and red-stemmed palms caught and held the eye, and all the spices of Arabia and Sumatra, of India and Ceylon, nutmeg and cinnamon, allspice, benzoin, sandalwood, patchouli and champaca was wafted on the balmy breezes of early morning. But for the loud-voiced welcome given me by a small pack of house dogs I should have, like the Lotus eaters, forgotten not only home and country, but even myself and my mission, so exquisitely dreamlike and satisfying was the scene. Then the genial old Chinaman himself came out and showed me his garden—orchids of the rarest, living palms and mangoes, and orange trees, pitcher plants swinging their dainty urns from bough to bough, caladiums with painted leaves as large and as bright as coloured pocket-handkerchiefs, zephyr flowers in the grass, and bougainvilleas like a crimson and lilac veil over the roof and verandah—colour, greenery, grace of leaf and of stem, and perfume all around, but the best had yet to come. Through a jungle of papyrus, and over a willow pattern plate-like bridge, and my genial guide stood aside to look at my face. Before me, through an opening in the reeds, which the stepping aside of my host had revealed, lay a long pool or canal full of tropical water lilies, fair as a dream, white rose, peach, blue, and crimson, all with swelling bud or with wide open blossoms, still wet with dew, lay basking like naiads in the early sunshine of a tropic day. One great floating mass of the Australian Blue Lotus (Nymphæa gigantea), with "flowers as big as soup plates" (*vide* Mrs. Rowan's "A Plant Hunter," a delightful book of an artist's life in Australia), made an impression on me I shall never forget. But better even than this was a water grove of Nelumbia, consisting of at least ten or twelve distinct varieties of N. speciosum, collected from all parts of India and China. There they stood before me, soft green leaves on slender stalks, for all the world like parasols, and amongst these the shapely swelling buds, the opening buds, and the great chalice or saucer-shaped flowers, each with a jewelled dewdrop or two at its heart. I had never seen or known how exquisitely lovely, how incomprehensibly variable and satisfying the Nelumbium alone in broad groups or masses could be. Flowers and buds by the hundred towering high up above the placid water, as if soaring to kiss the sun above their heads. I had seen the great Victoria regalis at Chatsworth and at Kew, and the tropical water lily tank or pools at Oxford and in the Regent's Park, but how stunted and starved, how "cribbed, cabined, and confined" under the glass roofs, as compared with Nature's luxuriance as assisted by art in an open-air garden. When the gong went for breakfast I felt loath to leave the lilies and the Lotus before me, but the sun had mounted higher, the pearly dewdrops that had shone "like jewels of gold in baskets of silver" had evaporated, here and there petals hung limp and placid in the torrid glare. My host led me into a cool and shady room, half open to the sky, and set before me a breakfast such as is not often enjoyed by princes or kings. All that money and taste and genuine hospitality could devise was there—a cool and fragrant atmosphere and grateful shade. The butter looked as if it had just left a Devonshire dairy, and the fish and rice, and the cool curry of young cucumbers, the iced coffee, and the fruit, all of the finest, seemed not to want eating, they melted away so easily on the tongue. We talked of many things, mainly of the flowers, and then came the inimitable cup of tea and the cheroot, and I left a genial host and a garden that will for ever be photographed in my heart, at least so long as gratitude and a love of the beautiful in Nature remain.

Nymphæa Lotus was figured in the *Botanical Magazine*, vol. 75, t. 4,469, but see also vol. 80, t. 4,823.

Nelumbium speciosum was figured in the *Botanical Magazine*, vol. 23, t. 903, under its old name of Nelumbo nucifera.

The Eastern Lotus has been well described as being "the noblest flower that dedicates its beauty to the sun," and it has been for ages the symbol in the East everywhere of love and beauty and joyful fertility. From Pekin to Thibet, from Colombo to Teheran, and the fertile plains of Cashmere, it is the sign of the highest life and beauty. Even the disciples of the Prophet love and admire its grace and bloom, but to Hindoo and Buddhist it is the shrine of shrines. The holiest as well as the most lovely of flowers, a ray of golden sunlight resting on a liquid gem. Everywhere in Thibet you hear the cry—or the sigh, as the case may be—"Om mani padme hum," the "Allah il Allah" of the Arabs; "Om mani padme hum," or "Hail, oh hail," "the jewel in the Lotus," on the lips of men, women, and children; even written and bound on the prayer-wheels—it is everywhere.

The word "Lotus" is an old Greek name used by Theophrastus (B.C. 374-285), and Dioscorides (A.D. 40) in connection with some leguminose plant not now exactly known. The bright golden little "bird's-foot trefoil," Lotus corniculatus, and the black or dark velvety-brown L. Jacobæus, are two well-known plants with which the name is associated in the fields and gardens of our own time. The "Lotus tree" of South Europe is Diospyrus Lotus, a not uncommon tree in botanical gardens. The Japanese Lotus tree is Diospyrus kaki, which when in fruit resembles a large-leaved plum tree covered with fruits, in shape and colour not unlike tomatos, except for the four large leathery bracts around the stalk. The Japan D. kaki, or Keg Fig, is now much grown in California and other South American States, and in Italy and South France, where a sweetmeat of it, called "Figue-caques" is made. The Virginian Date Plum, or Tree Lotus, is Diospyrus virginiana, with fruits as large as Siberian crabs. eatable only after frost, and of which beer, cider, and a spirituous liquor have been made in North America by both settlers and the native Indians. D. mabola and D. decandra are fruit-bearing trees in the Mauritius, and in Cochin China respectively.



NELUMBIUM RHIZOMES AND SEEDS.

One cannot use the word Lote or Lotus without naturally thinking of the Lotus eaters of the Greeks, the Lotophagi of Homer (1000 B.C.).

In modern literature "a Lotus eater" is a sort of Harold Skimpole, or a person who gives himself up to mere pleasure-seeking and indolent enjoyment. The classical Lotophagi, however, were a peaceful and hospitable people, who lived in a fertile district of Cyrenaica, on the North African coast, and who appear to have depended for their sustenance on the fruit of the true Lotus tree, or Zizyphus Lotus, African or Jujube Tree Lotus. Its fruits are yellow, skin wrinkled, of the size of a small olive, sweet and farinaceous. The leaves are two to three inches long, ovate, serrate or crenulate, three-veined, bases of the petiole spinose, the fruits being solitary in the axils of the leaves on the slender flexuose branchlets. It is wild in North Africa, and is cultivated in South Europe. The Lotus fruit of the ancients is fabled as having made the companions of Ulysses and other strangers to forget their homes and native land, so that they had no desire to return. This life in the happy valley, with its sense of languor, a delicious satisfaction, has been most beautifully expressed by the late Poet Laureate, Tennyson, in his well-known poem entitled "The Lotos Eaters." An allied species, Z. Jujuba, is found in North Africa, India, and Australia, and forms a tree of thirty to fifty feet in height.

In architecture the word lotus or lotos, for it is spelt both ways (λωτος), is used in speaking of an ornament in the form of the Egyptian Lotus, or water lily, much used in early religious and domestic architecture, and especially frequent as a terminal or capital on Egyptian columns, in the temples, and on wall sculptures, &c.

"The dew is on the Lotus! Rise, great Sun!
And lift my leaf, and mix the wave with me
'*Om mani padme hum*,' the sunrise comes!
The dewdrop slips into the shining sea,"
"Light of Asia."—ARNOLD.

THE STORY OF OSIS.

(From a roll of papyrus found in a mummy case in the Fayoum, but not known to Mr. Flinders Petrie)

"I.

"The dawn was red as the sun rose over the marshes and lit the tops of the great pillar stones with rosy light. Then Osis, the beautiful daughter of Pharaoh, and her maids went forth to the river to bathe, One little slave girl, the favourite one and an Hebrew, sighed. 'Now. little one,' said Osis, 'what aileth thee?' 'Ah! most beautiful,' said the girl, 'how much is one day like unto another. We eat, and drink, and sleep, and bathe in the river, but Horus comes not nigh us nor dwells in our palaces.' 'What would you, little one?' said Osis. 'To love is not everything. To love is often to kill your soul alive.' 'Not so, fairest one,' said the Hebrew girl. 'Last night I saw a young water carrier kiss a fisherman's daughter beneath the tamarisks and oleanders, and then they laughed and sang together, and were as happy as children of the gods.' 'Ah! so it may have seemed to thee, child,' said Osis; 'but so the Sun God kisses away the dewdrops from the Lotus flowers, and behold day by day do they not fade and wither before thine eyes?' 'Daughter of the Highest,' said the maid, 'and so would I also die gladly if Amasis would but love me, for I should ever after have the jewel in the Lotus—love and contentment—in my heart.' Osis said no more, but after that night the pretty dark-eyed maid was no more seen amongst those who bathed in the river.

"II.

"Now a year or more had passed as does a summer's day, and the cruel law had gone forth that all the firstborn in Egypt should be slain. The chief steward sat with Ba Salah, he who built the great temple and tombs for Pharaoh. 'How goes on that stripling, Amasis?' said he. 'He doeth well,' said the great builder, 'since Osis granted him his heart's desire, and when I am gone no builder in Egypt will be greater than Amasis. His tall pillars have pleased the heart of the Great One, and he has still better work to come.' 'It is all very wonderful,' said the steward, 'and since Osis befriends him all is well.'

"Again and again in the rosy dawn the white-robed women went down to the river to bathe, and a little cry came from the water lilies and reeds, and when the girls looked down, behold, there was a basket of rushes, and in it a baby boy, who ceased crying, and stretched up his hand as Osis passed. The maids shrank back, and looked on the face of their mistress sore afraid. 'Take up the child,' she said, 'and hide him in the house quickly, so that none may see,' and it was so.

"III.

"And some evil days passed, and others came, but the boy grew up in the house of Osis, and was taught of the scribes; and day by day he saw the Lotus lilies in the pools and tanks, and watched the slaves and their cruel overseers as they built the great pyramid of brick, and made the great tanks of the temples, and watered the rare trees and flowers in the palace garden. And is it not written how he became the deliverer of his people from bondage in Egypt, and how he led them towards the promised land? Day by day Amasis worked in the buildings, forming here columns like bundles of papyrus, and carving Lotus buds and flowers on his great pillars, and at eventide he went home to his house under the date palms in the corner of the great garden. And his dark-eyed wife laughed and sang, and sometimes Osis with two or three of her maids came to the little lodge in the garden, and the wife of Amasis gave them sweet cakes with black seeds in them, very nice to eat, and clear amber wine to drink from elegant little glasses, that shone with all the colours of the rainbow. And in one of the smaller rooms of the temple at Karnac you can to this day see Amasis and his wife offering Lotus flowers to Osis, because, as it is written, 'she (Osis) did good to her people, and loved those who served her faithfully and well.'

"And Osis the most beautiful." . .

The end of the papyrus roll is here worm-eaten and torn and utterly undecipherable.

Nelumbia, like their cousins the

water nymphæas, are easily raised from seeds or by dividing the rhizomes. Both may also be grown in tubs or shallow tanks, with four to six inches of rich mud at the bottom, and filled with water. "Owing to the nature of their stocks, tubercles, and root stocks, nymphæas can be sent very far off in every season without getting damaged." Thus writes a sanguine grower, and to his statement I would add, "always sometimes," for the erratic vagaries of the railroad man, and of he of the parcel post, are many; he doeth as he listeth, none daring to make him afraid! Neither nymphæas nor Nelumbia should be planted deep, fifteen to twenty inches of water over six inches of compost being sufficient. The point to observe is that a shallow sheet of water is more quickly heated by sunshine, and shelter, not shade, is desirable, since water lilies and Lotus alike hate to be blown on by the wind.

M. Bary Latour Marliac, of Temple-sur-Lot, who has raised most of the new hardy varieties of nymphæa, also offers no less than eight fine varieties of Nelumbium speciosum in his latest lists. They are album, with large ivory-white flowers; album striatum, with its floral segments white at the base, and striped and tipped with rosy carmine; Japonicum roseum has rosy lilac petals shading to white below; N. luteum, with soft, sulphur yellow flowers; Osiris, which has intense rosy-crimson blooms; Pekinense rubrum, one of the best and deepest coloured varieties yet obtained; Speciosum roseum, of a deep rich rose colour, creamy-white at the base; and lastly, Roseum plenum, a very distinct "double" variety, having eighty petals of a deep rose colour, and resembling a fine flower of tree pæony, one of the rarest and best. The prices of the above vary from four to eight shillings, so that initial expenses need not deter one from growing these exquisite Lotus lilies in our gardens. To succeed with them one must either grow them in tubs or tanks in a warm, sunny hothouse, or you may run a hot-water pipe or two under the water in a shallow open-air tank made in a sheltered position and exposed to every ray of sunlight all day long. Given these conveniences, either Nelumbia or subtropical Nymphæas, such as the sweet-scented N. cærulea, N. stellata, N. Daubeneyana, &c., may be flowered in the open air, as has been done by Mr. Hudson at Gunnersbury, and by other cultivators having heated water in open-air ponds and tanks elsewhere. As an enthusiast writes: "The aspect of a sheet of water studded with these countless many-coloured flowers, swung to and fro by the breeze, like a richly-decked flotilla, is delightful. Everybody now is passionately fond of cultivating these charming undines, which grow in all sorts of waters (rain, spring, and river waters), in all aquaria, large and small, in ponds, basins, tubs, bowls, and come up in the sun as in the shade"—to which I would add here, the less shade the better.

The "Western Lotus" (*Nelumbium luteum*)* is found in the West Indies and in the Southern American States. Like N. speciosum, it has peltate velvety green leaves, very soft and pale below, and borne on long stalks which are spiny towards the leaf blade. The flowers are pale yellow or primrose coloured, and the outspread segments measure a foot or more in diameter. The flower has been well described as being like a gigantic semi-double tulip, and its blossoms are delicately scented. It was introduced to British gardens in 1810, and flowered in the hothouse or plant stove of Mr. Miller, of Durdham Down Nursery, near Bristol, in September, 1839. The plant has since bloomed at Kew and at Cambridge Botanical Gardens; and at Paris it was for years grown and bloomed, and may be so still, in a round tank in the open-air garden, a covering or roof of glass being put on in September, and allowed to remain on until April or May. Extending from New Jersey to Eastern Florida, and inland to Louisiana, it may be called the Queen of American aquatics, and is the largest wild flower of the Southern States, with the one exception of Magnolia fœtida (M. grandiflora). It has been introduced into ponds and lakes near Philadelphia, but its natural limits are not so far north, though Michaux found it as far north as Illinois. A white-flowered form is alluded to by Mr. Walter, but Barton and other botanists have regarded N. luteum as a mere geographical form of the variable N. speciosum, which often has white flowers. Although this plant usually grows in shallow pools and streams, yet Bartram saw it extending across Cape Fear River, in North Carolina, where it is two miles broad, and twelve feet or more in depth, "its leaves covering many acres, and forming a delusive wavy plain." Its flowers open in the morning and close at sunset, opening again on the following two or three days if not fertilised. The nocturnal closing seems a natural provision to keep its pollen dry, and to exclude nocturnal insect visitors.

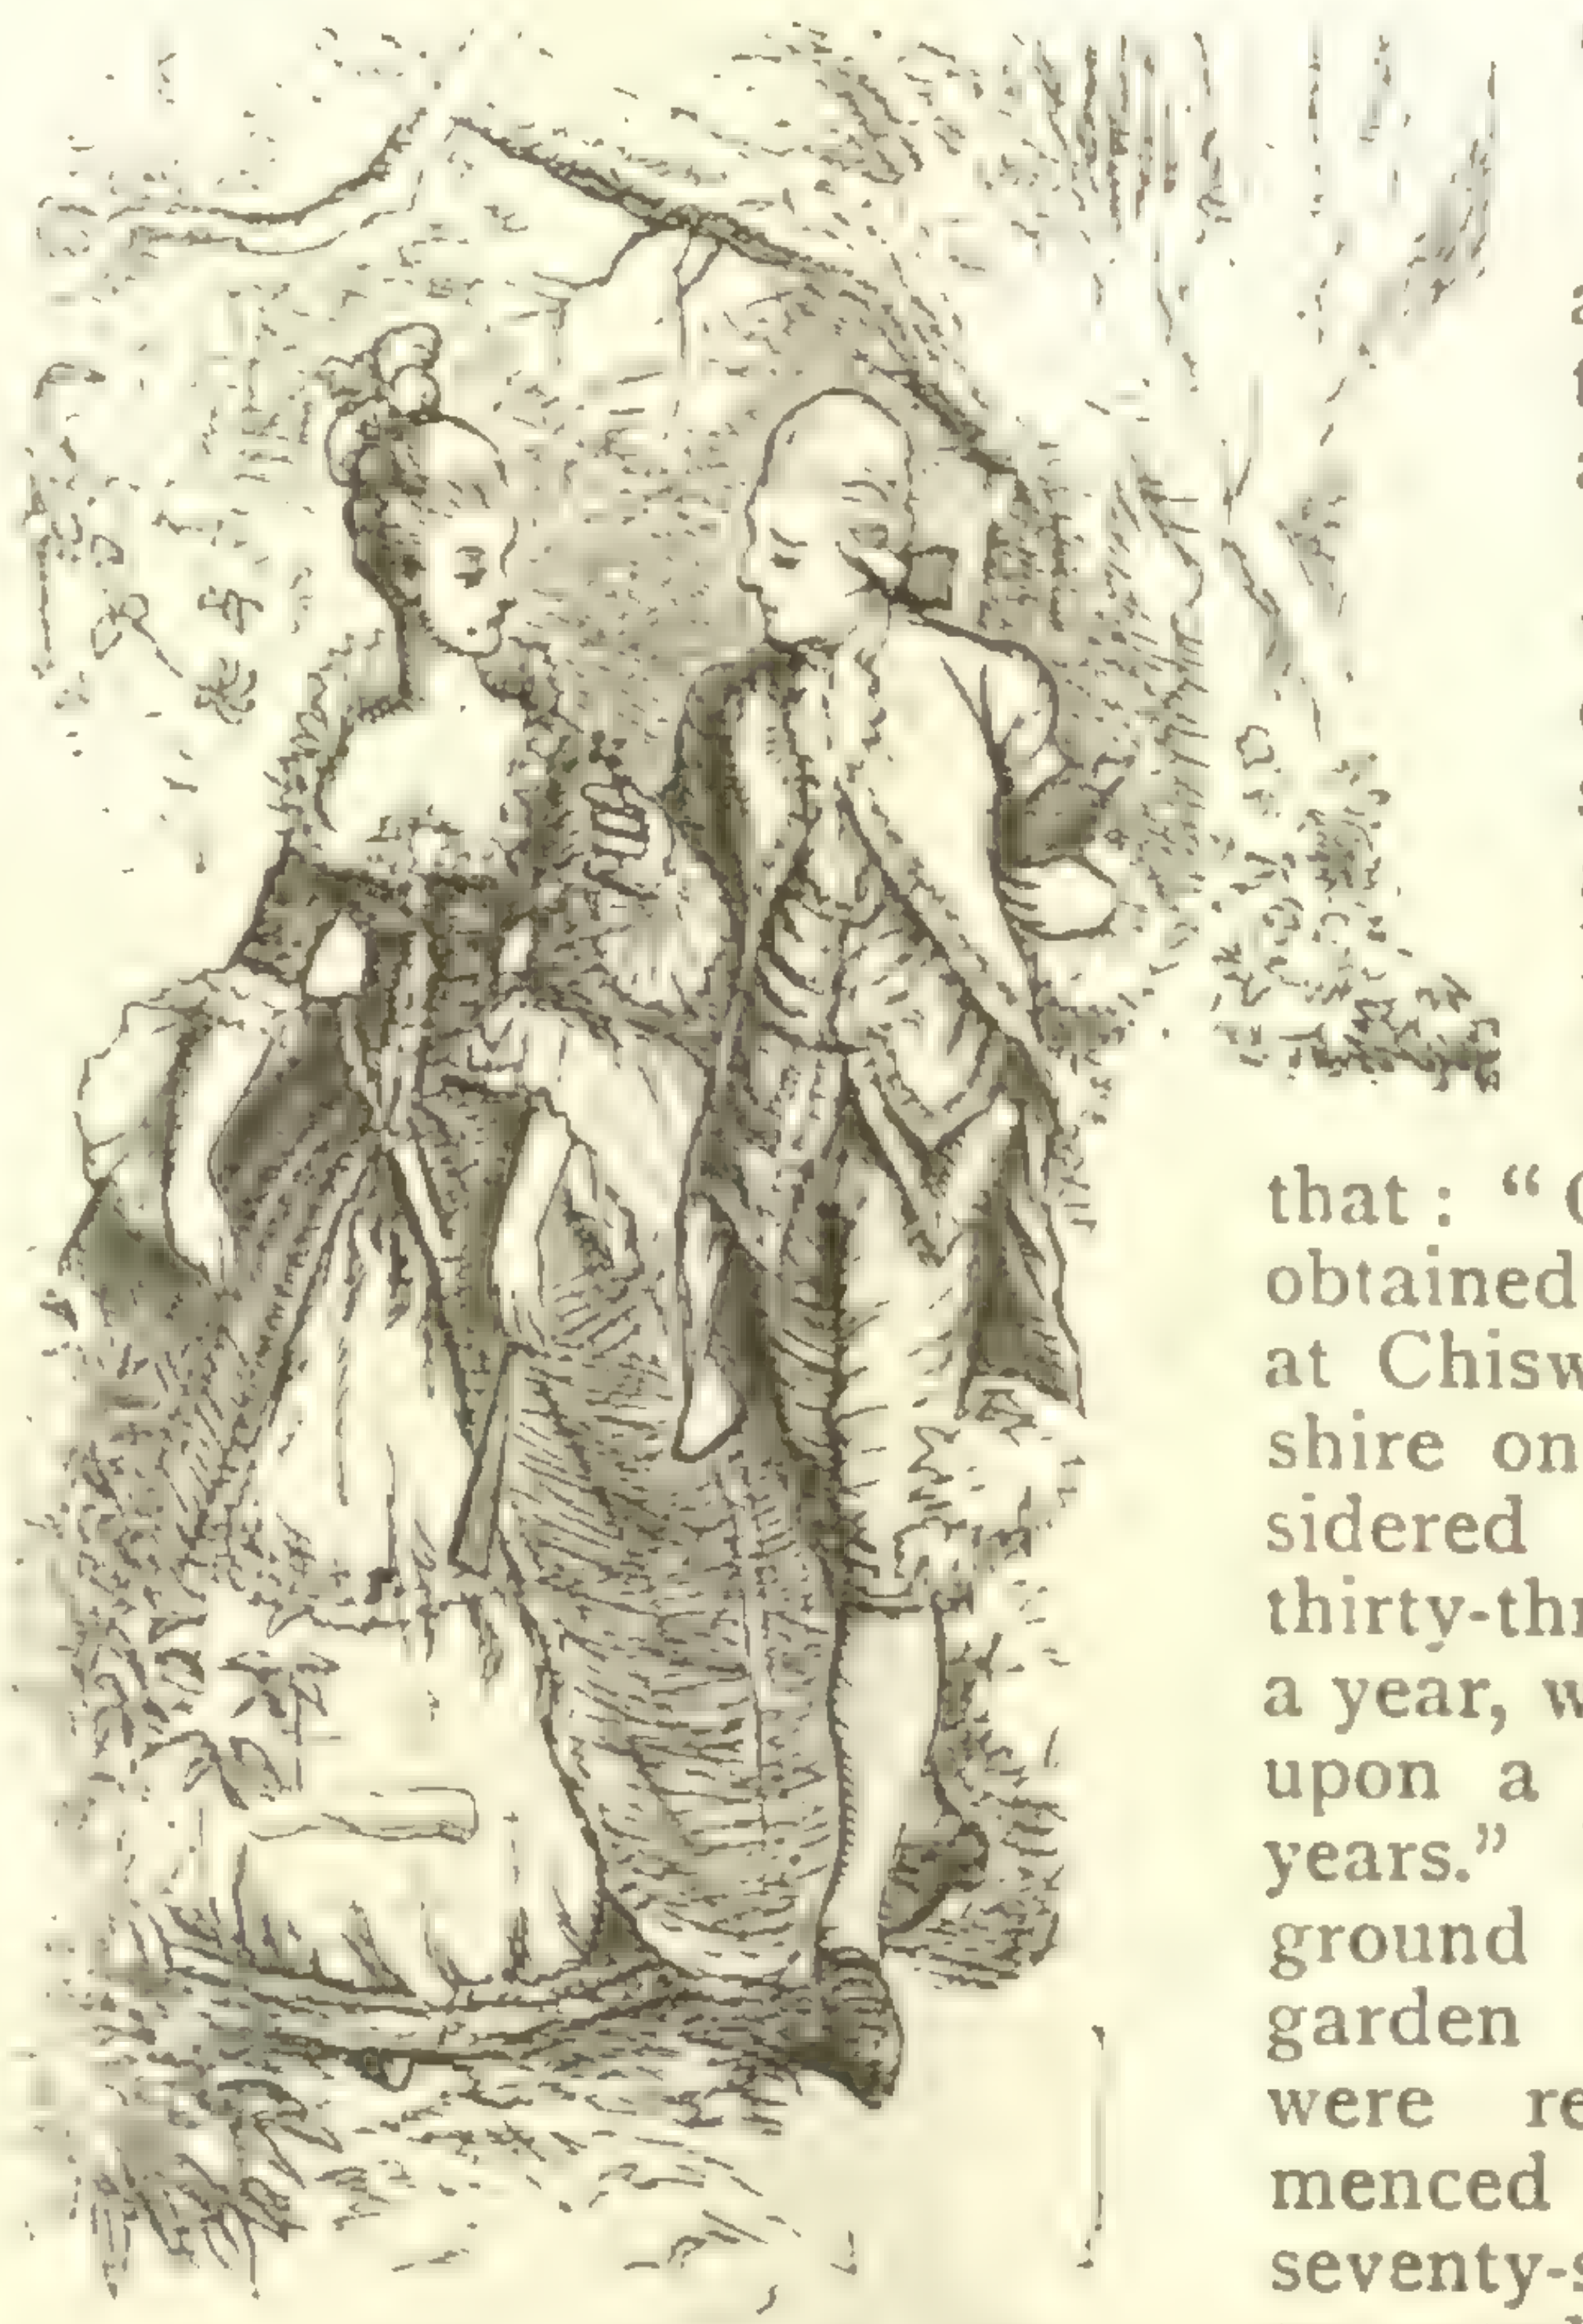
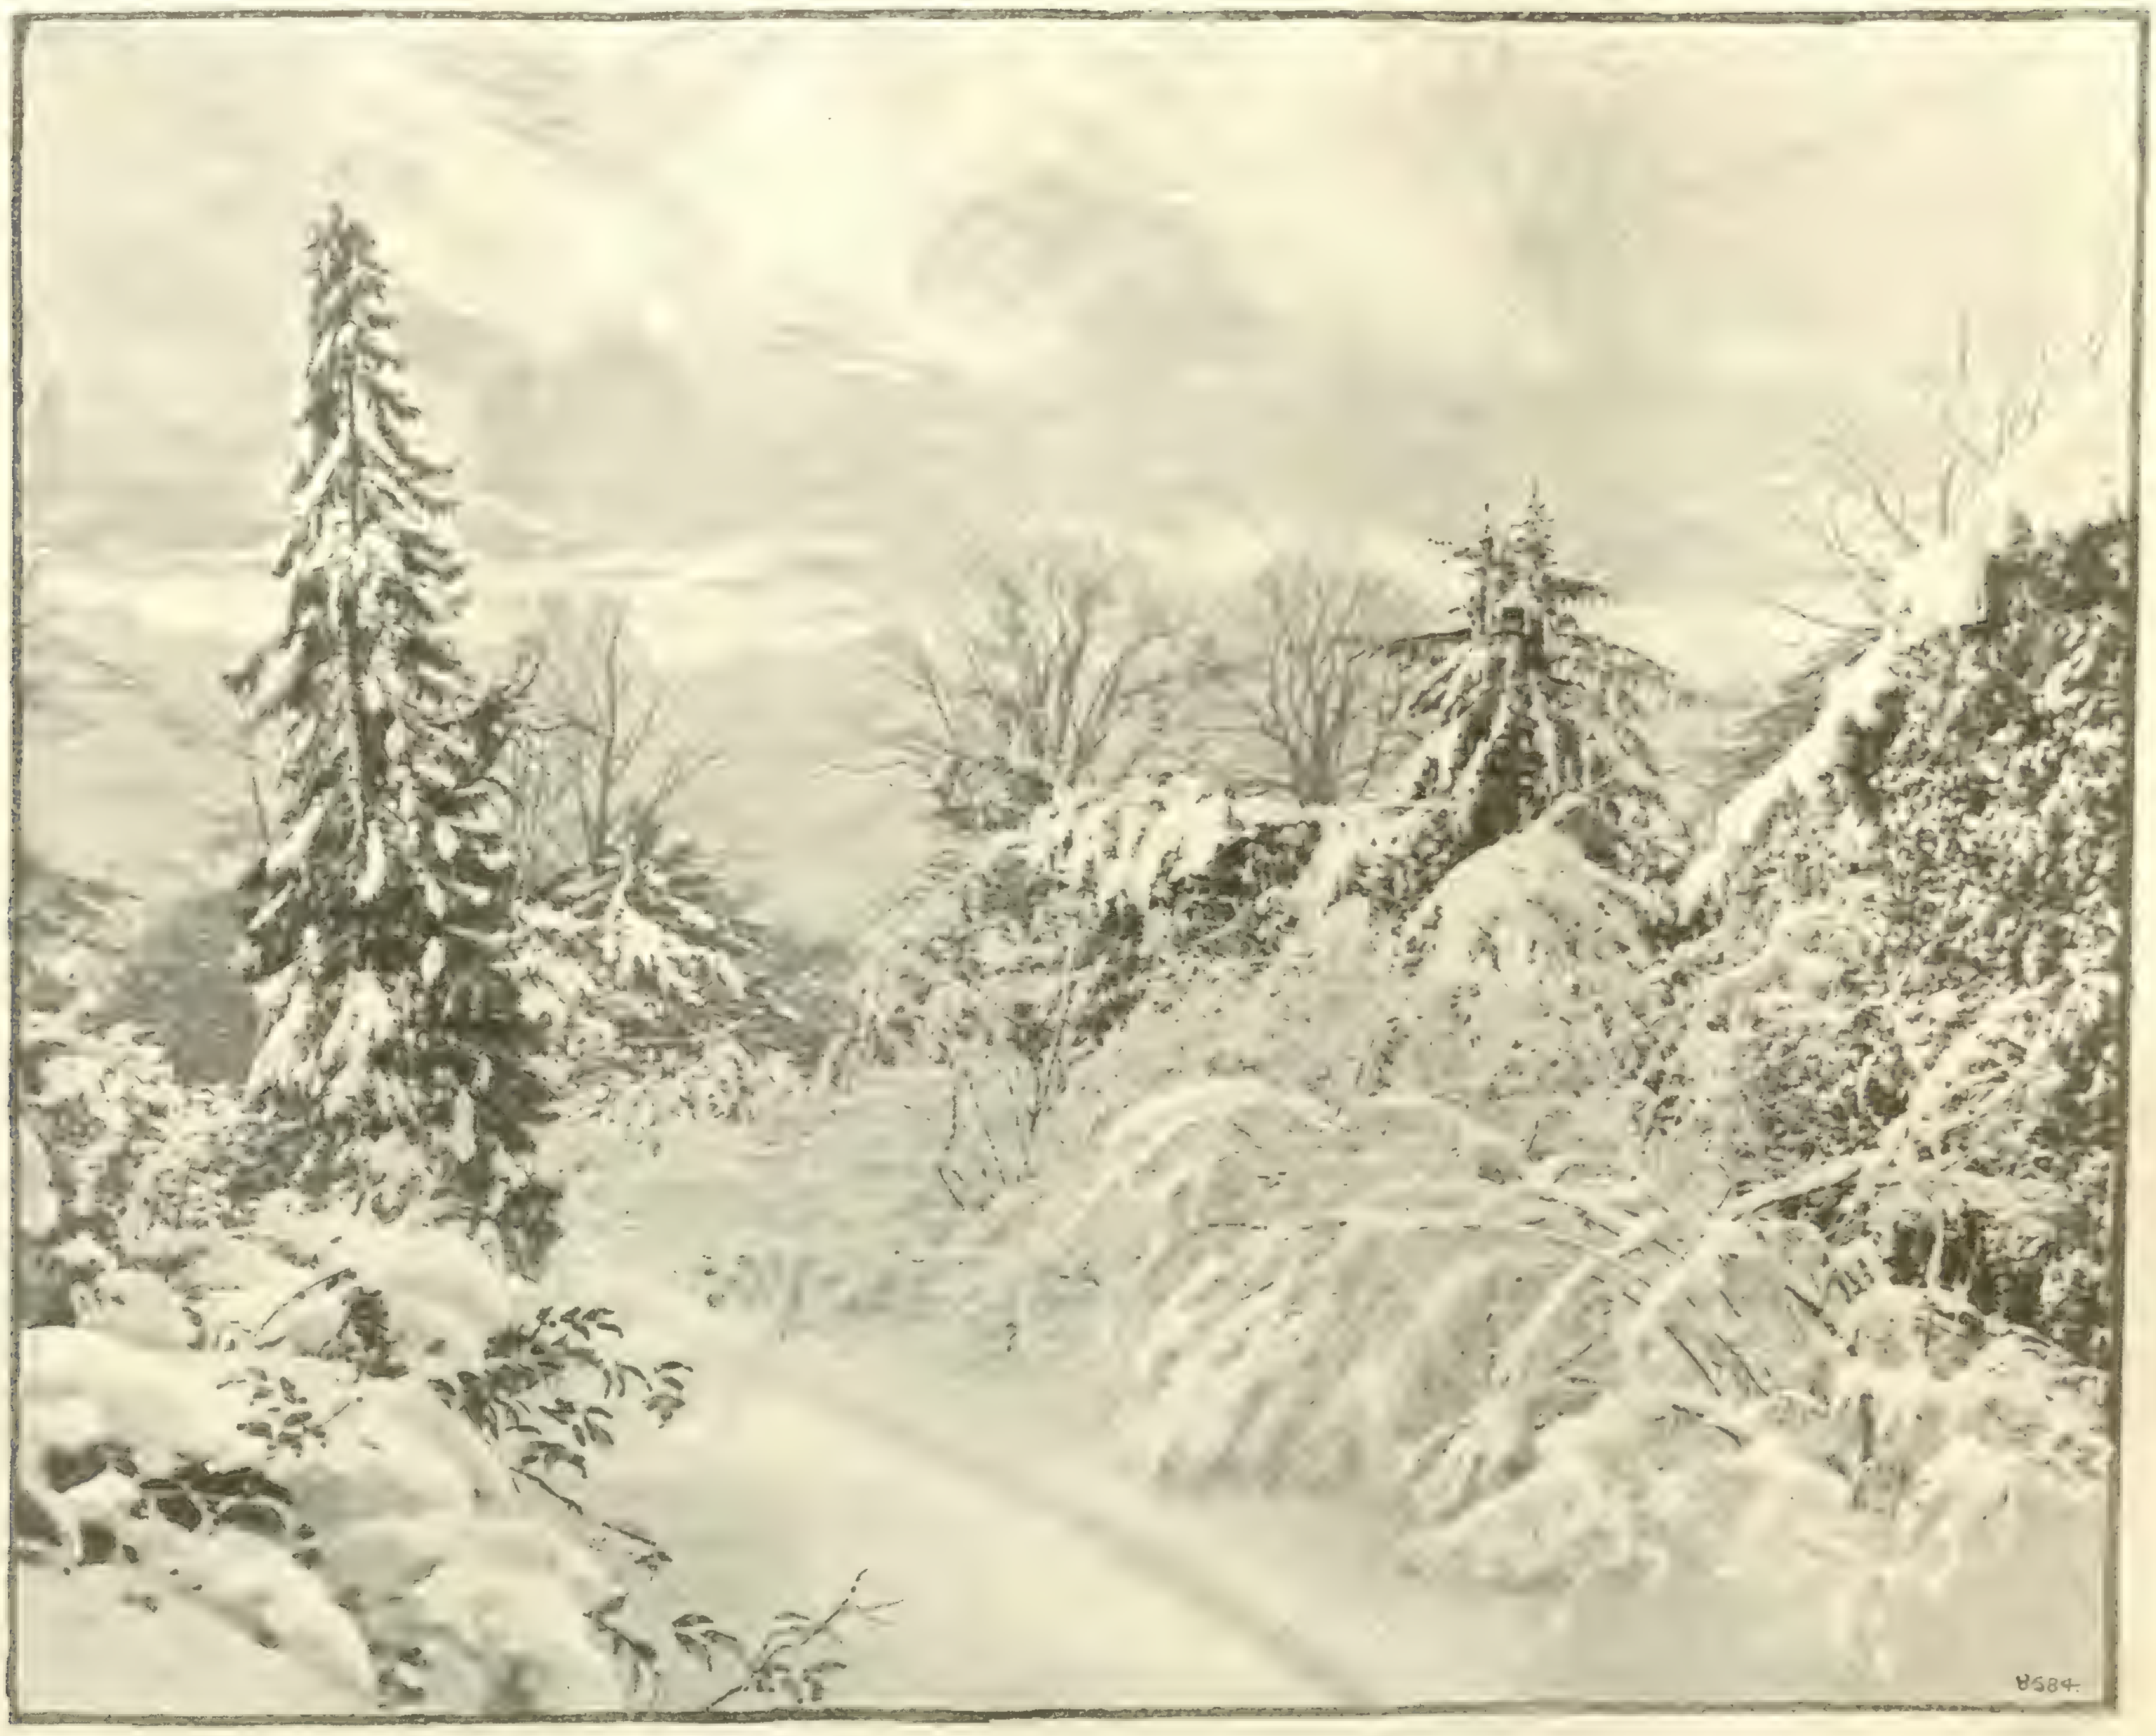
EARLY DAYS OF AN OLD HISTORIC GARDEN.

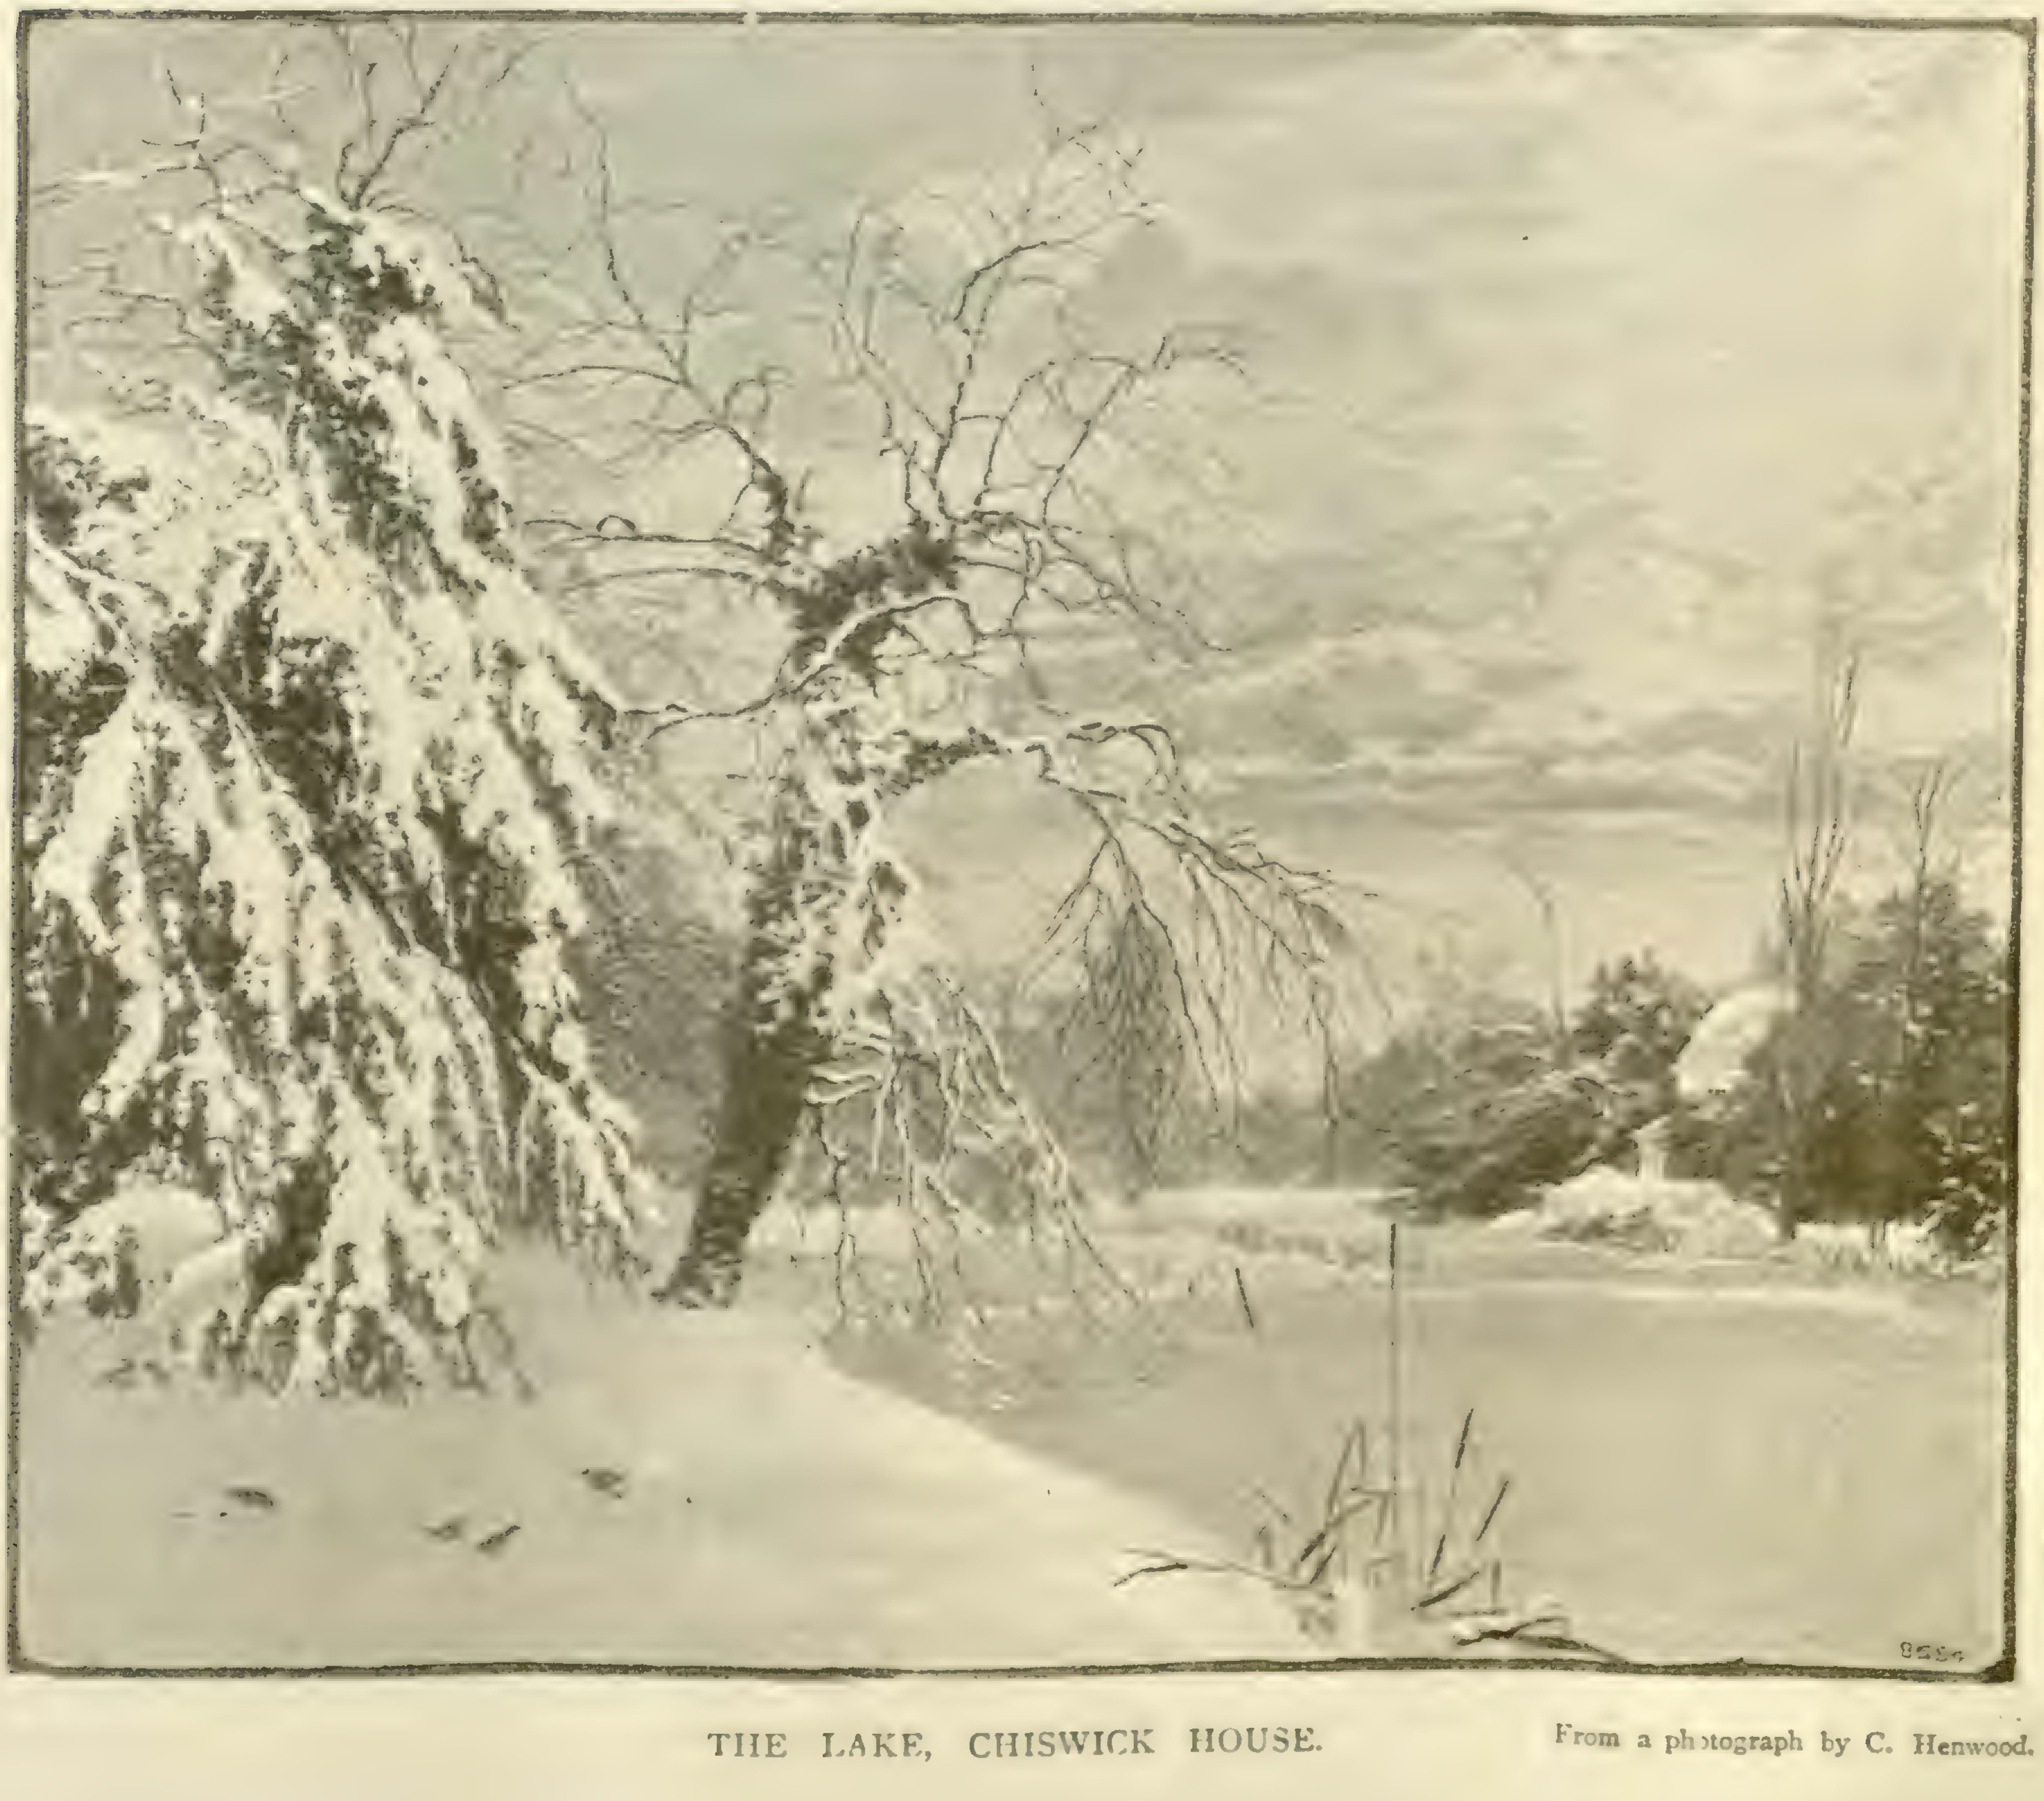


The exact date of the establishment of the Horticultural Society's garden at Chiswick has been from time to time variously stated, some authorities giving it as early as 1818, probably confounding it with the establishment of an experimental garden at Kensington at the end of that year, and of an auxiliary nursery or hospital garden at Ealing. From the "Book of the Royal Horticultural Society" we learn that: "On March 21, 1822, the society obtained a lease of the present garden at Chiswick from the Duke of Devonshire on terms which were then considered favourable. Its extent was thirty-three acres, and the rent £300 a year, with a power of renewal for ever upon a fine of £450 every thirty years." Upon taking possession of the ground at Chiswick, the Kensington garden and its auxiliary at Ealing were relinquished, and thus commenced the historic garden which, seventy-six years afterwards, is still tenanted by the society. Dear old Chiswick! illustrious in the past, and pregnant with interest for numbers in the present, though some think time has put the stamp of decay upon it, making it a declining force in horticultural enterprise. It will ever stand as a time-mark in the horticultural annals of the nineteenth century; there cluster about it a multitude of horticultural associations and of pleasant memories; it recalls keen competitions, social gatherings, many interesting experiments, and a long list of cultural successes, all of which fire the imaginations of young gardeners, and incline them to look back with sympathetic interest upon the doings of their forefathers in the time long since. Who that has mixed much among practical horticulturists during the past thirty years has not been a delighted listener to the reminiscences of old Chiswick students and boys, when they meet years after and tell of escapades, exploits, events, and associations which thrill the memory and send it back to distant days, when great exhibitions were in their prime, when horticulture drew to it the fashionable world, and the old Chiswick gardens were a university of practical gardening in this country.

The "Florist" for 1848 contains two excellent and clear woodcuts of one of the famed exhibitions at Chiswick; those who never witnessed one can gain from these illustrations some idea of what it was like. There was then a long stretch of turf east of the great vinery on which the tents were pitched, there were spreading shade-trees, and given fine weather the scene was animated in the extreme. I recall with pleasure the sight of one of these shows—it must have been that in 1855—just when their glory was on the wane. I remember the excitement, not unmixed with the delightful anticipation of the night journey from Slough to London, seated by the side of a driver on a van laden with precious specimen plants of pelargoniums. The incidents of that journey are clear and fresh in my memory; it was all novel and diverting, the stoppages at the night houses and the characters which were met with. The time was June, the night very chilly and unpleasant, but much was strange and new which made it endurable. The reaching of Turnham Green by day break, the concourse of vans, the unloading and conveyance of the specimens to the tents, the staging, the subsequent breakfast and wash, and then the stroll through the tents when the public were admitted. Dr. Lindley was very particular about the appearance of the exhibition assistants, and would have in the tents only those which were presentable. It was the first big flower show I had ever looked upon, and it filled me with wonder and delight. The tents were mostly open at the sides, they were in consequence much less stuffy and sweltering than is experienced in these days. The huge circular tent, which later was such a fine feature at provincial shows, was there, full of the fine specimens grown in these days: Aphelexis, Boronia, chorozema, Crowea, Franciscea, Gompholobium, Leschenaultia, Pimelia, and Polygala; but some of these are well-nigh forgotten, and rarely seen now. Dipladenia crassinoda was the only one exhibited in that day; it was so in the case of Allamanda cathartica; the only Ixoras were alba and coccinea; the large-flowered allamandas were unknown; so to Bougainvillea glabra, Clerodendron Balfourianum, or Anthurium Scherzerianum. I think of old William Barnes, of Camberwell, and his retort to one who said in his presence that the collections of stove and greenhouse plants since the introduction of some of the rapid-growing stove climbers now so much exhibited were better than they were forty years ago. The veteran said, "Give me the man who can grow Gompholobium polymorphum splendens, and I will show you a cultivator of specimens." The task of providing fine and attractive specimen plants is an easier one in these later days than it was in those of William Barnes. There were giant growers at that period—the Mays, Collyer, Williams, Peed, Rhodes, Green, Donald, Dods, Carson, and others, all of whom by their skill as cultivators and their success as exhibitors wrote their names large on contemporary annals of horticulture.



THE ARBORETUM IN WINTER, CHISWICK HOUSE. From a photograph by C. Henwood.



THE LAKE, CHISWICK HOUSE. From a photograph by C. Henwood.

And there was the walk through the Chiswick grounds until the exit was reached near the entrance, through massive gates, to Chiswick House, for the Duke of Devonshire of that day granted this permission to visitors to the Chiswick shows. Who can forget the sublimity of the ancient cedars near the mansion—specimens which had withstood the tempests of centuries, and had witnessed the gathering beneath their grateful shade of thousands of the world of fashion and renown? We have nothing like these gatherings now; the glory is departed with hundreds of those who promenaded the charming lawn of this historical mansion.

It was not all success at Chiswick in the old days. There were times when the council had to face periods of acute anxiety over financial difficulties; when Fellows fell away, as some constantly will and still do, and when the fashionable support, upon which so much then depended, was not constantly forthcoming. There were flower show days of storm and tempest, when the maddened winds spent their fury on the canvas tents, leaving ruin and dismay in their wake. There was one memorable occasion of a breakfast fête towards the end of the forties, when the weather turned out lamentably unpropitious. Ample tents had been erected, and an appropriate feast prepared. There was gorgeous plate, fine china, and sparkling crystal, combined with the most delicate viands and high-priced wines, to charm the eye and tempt the palate. But heavy rains descended, a howling wind arose, the pillars of the tents gave way in the water-soddened earth, and there was imminent danger that the whole fabric would collapse and bury the numerous company in its wet embrace. Men were called in from the streets; they gathered about the pillars and held them up while the visitors feasted within. It is recorded that after feasting they engaged in dancing on the wet and splashy turf, dancing in soaked boots and shoes; and there is a local tradition extant that a bushel of wet shoes and stockings were picked up in the garden and neighbourhood next day—probably thrown from the carriage windows after the owners had obtained fresh supplies from the Chiswick shops on leaving. The end came at last. "No sooner had the last visitor taken his departure, and the men had been released from their long and laborious duty, than the posts and pegs of the tents slowly yielded, ploughing through the muddy puddle in which they stood, and the whole fabric gave way with a crash, burying in one indistinguishable ruin the tables and the dinner service, wines and viands, under their wet and heavy folds. It was a fortnight afterwards before the purveyors were able to have all the articles, overwhelmed on that night, removed; and it is noteworthy, and to the credit of the society's servants, that although the whole *appareil* of the feast—broken crystal and viands—lay mixed with valuable plate for so many days, not a single article was lost. The spoons and forks were recovered by raking them out of the mud, and not one was missing."

Any contemplation of the work done at Chiswick during the past fifty years recalls the names of Thompson, McEwen, Eyles, and Barron; their memories smell sweet in the fragrance of the worthy work each did. And even now the eyes of the Horticultural world are turned towards Chiswick in faith and confidence that worthy work is still being done there; and many a pilgrimage is made to this shrine of gardening, and no devotee goes away disappointed. If the surroundings are less favourable to good culture than they were thirty years ago, they are combatted by pluck, skill, enterprise, and resource.

What of the future of Chiswick? There are some who earnestly wish this sacred spot to be for ever associated with the Royal Horticultural Society, and there are others who think its force is spent and its resources exhausted. Whatever may be its future, the thoughts of many will cluster in tender association about this old garden, and gratefully revere it for its glorious past. It may be the next generation will witness the uprising of a new Chiswick in some more favoured spot; and if it can rival, even if it does not transcend, the successes of the old, there will be gratitude and good wishes for it among the entire gardening community.

Richard Dean, V.M.H.

DESSERT APPLES AND PEARS FOR CHRISTMAS.

At this season of the year, when apples are in great demand, one must have good varieties. Ribston Pippin, which some palates prefer to all other apples, is one of the best, and though our fruits are not so fine as usual the flavour is first rate. Personally I prefer Cox's Orange, and these, when ripened in a little warmth, are absolutely unsurpassable. Unfortunately, quantities of apples are palmed off upon the public as Cox's which are not that variety at all. Blenheim Orange is also a good dessert apple, and one which finds much favour; in fact, it answers a twofold purpose, for it is an extraordinarily good culinary apple, and the best for mincemeat. Scarlet Nonpareil and Rosemary Russet are also superb varieties for Christmastide, and should be in every collection of dessert apples at this season.

Doyenne du Comice stands out quite alone at this season as a dessert pear of high and delicious flavour. The long autumn gave them such a long growing season that the flavour has been very considerably enhanced, and my employers and their visitors speak highly in their praise. We have had this variety in use since the beginning of October. Beurré Diel is a very fine Christmas pear, the flavour being unusually rich this year, and though the fruits are somewhat smaller than usual, they are quite large enough for dessert. Winter Nelis is also very good this season, being brighter and less marked than is the case sometimes. They are also exceedingly rich in flavour. But one may have all these and other varieties in season, yet they will all have to take positions below Doyenne du Comice.

Combton Basset. W. A. Cook.

THE DETECTIVE PLANT.

Sugarapsa plumosa (Bunkles).

MY old friend Bunkles is a many-sided man, and hence his intimate friends and his outside acquaintances form very different estimates of him, ranging from a jolly good fellow down to a cantankerous cuss, both of which extremes, I may remark, are fully justified from time to time, just as circumstances may shape his temper. This sort of variegation is, of course, not peculiar to Bunkles, but it must be admitted that he was a strongly marked specimen of the cantankerous type when he chose, and thought he had good reason for so doing, to adopt that particular phase of character. Another peculiarity of his also led to divergences of opinion about him, and that was a talent for sly, practical jokes, which his intimate friends laughed at, and sometimes repaid in kind, but which occasionally upset the equanimity of outsiders, who took matters seriously, and were consequently "sold." I recollect Bunkles getting into terribly hot water on one occasion when some brilliant scientific lights had honoured the local flower show with their coruscations, and were afterwards entertained at a little dinner. After the dinner Bunkles produced a most remarkable hybrid plant, displaying the characters of half-a-dozen species, which, he said, had originated in his greenhouse. Professor Solemun, O.P.Q.L.M.N., and several of his colleagues examined the specimen, and promulgated a number of vastly abstruse theories, justifying the peculiar phenomena of pangenetical hybridity thus exemplified. Dr. Goggles, B.C.D.E.F.G., and Professor Dummkopf, two others of the honoured guests, followed suit, and when they were all done Bunkles pulls the thing out of the pot and displays an elaborate system of wiring up as a probable explanation. Ructions followed, of course, for the thing had gone too far, but I will do Bunkles the justice of saying that he thought the fraud would have been too obvious to deceive the "wise-acres" (as he irreverently termed them) as it did.

Now, Bunkles had a garden, a large garden, far too large for him to keep in order by himself, and Bunkles consequently had also a gardener, or, rather, a succession of gardeners, for I don't suppose I shall create an immense amount of surprise when I state that in this connection the cantankerous feature was not infrequent in the relations between master and man. In these cases it was frequently difficult to know who was the more to blame, for from the gardener's point of view it must be extremely provoking to find all sorts of little traps set to prove dereliction of duty or breach of instructions. Bunkles would give strict injunctions that certain presumably precious things were to be severely let alone, and, of course, John the gardener would want to see the reason why, with the result that half-a-dozen pots and pans would turn out to be set as it were on a hair trigger, and an irreparable smash resulted from his meddling, the whole affair, I need hardly say, being merely a "trap," totally unconnected with anything precious, as John presumed. Bunkles, however, was not altogether malicious in these matters, for the fact was that he had a perfect genius for the raising of plants from hopeless looking bits and moribund remainders by little coddling dodges of his own, and from his point of view it was desperately provoking to find these delicate little sparks of vitality snuffed out by John's curiosity to see either "what they wos" or "whether they wos growin'." I have even seen Bunkles stretch a few spider's threads across a particularly precious pot as a trap of this sort, the broken web revealing the delinquency of John, to his immense mystification. Minor sins of this sort, however, Bunkles' "good fellow" side led him speedily to forgive, and every now and again he would be able to keep a man John in his employ for several months together. One indeed was with him a full year, but "Sugarapsa" turned up, and his occupation was, like Othello's, gone.

Bunkles, like every amateur horticulturist worth his salt, kept a constant eye open for the newest and best of his particular fancy plants, and one of his greatest enjoyments when a congenial spirit turned up was to display his latest acquisitions and to dilate upon their beauty and rarity. One such spirit dwelt about a mile away from Bunkles' little Paradise, and in time a sort of friendly rivalry set in. About this time Bunkles began to have suspicions that some of his less recent novelties had a knack of disappearing, either *in toto* or partially, the plants shrinking in size very mysteriously. These shrinkages or disappearances happened invariably during his occasional absence from home, and John's explanations were of the vaguest the total disappearances being imputed to raids by unknown depredators "over the garden wall." Curiously enough, however, Bunkles found his friend's collection richer on several occasions by precisely similar plants to those he missed, and one evening while out for a stroll he found John and William—that is his friend's gardener—in close confab, which they broke off with suspicious abruptness at his approach. An incapacity for putting two and two together was certainly not a weakness of Bunkles; he made the addition and concocted a plan.

The following week Bunkles arrived home with a very beautiful specimen of vegetation in a pot, which he carefully installed in a place of honour in his greenhouse, and instructed John to take very particular care of it, as there were only two or three such in the country, and its value consequently was very great. Bunkles at the same time made John bring him a label, and with his own hands, in clear print, he wrote the name "Sugarapsa plumosa." John admired the plant extremely, its fine delicate hair-like foliage being altogether new to him, and Bunkles' estimate of its value obviously just. A few weeks elapsed and Bunkles went for a fishing excursion in the north, returning a fortnight after. His first care on his return was to inspect Sugarapsa, respecting which John had a doleful tale to tell of an intrusive cat, a terrible smash, and consequent repotting as best he could, the result being, as Bunkles mentally noted, "another dwindle and a rhyme to it." Now comes the curious part of the story. Bunkles on visiting his friend, which he was not long in doing, found by an extraordinary coincidence that he too had a plant of the wonderful Sugarapsa plumosa, which his gardener William had recently acquired from a well-known nursery firm as a great bargain at two guineas, there being only, as he was told, three plants of it in existence. Now Bunkles and his friend were old chums, and he knew perfectly well that so far as the master was concerned all was fair, square, and above board, so, having heard the history of the acquisition, he whispered a word or two in his ear, and asked him to send William for his man John on some simple pretext, which was done.

"Now, William," said Bunkles, "you say you bought that plant at the nursery. Did you buy it under that name?" "Why, certainly, sir, a course I did; that's the proper name on it." "Well, John," said Bunkles, turning to his own man, "you stole that plant from me and sold it to William, for that name is my own invention. Read it backwards, and out loud, and you will stand self-convicted." John had no alternative, and read it out "Asparagus," and for his pains got the "sack," in conjunction with William, who were lucky to get off so easy. "A beautiful plant, isn't it?" said Bunkles, and a beautiful "plant" I thought it was. JACK BOWSER.

CHRISTMAS WEATHER LORE.

As might only be expected of a month which embraces within its orbit the greatest festival of the Christian Church, and coming, as it does, within the more superstitious half of the year, December has more than its full share of weather lore, which, like all other rustic and country-side folk-lore, is sometimes true, but very often false. As, however, all these fantastic legends are worth preserving, I give in the following lines some few of the proverbs of the weather-wise which have come down to our own times, and which have been culled from a variety of sources. Thus we know that a cold and snowy December is good for rye, a matter of far greater moment in Russia than in England; while again thunder in December is held to presage fine weather. In Scotland there is a jingle referring to November 11 and December 25, running thus:—

"'Tween Martinmas and Yule
Water's wine in every pool."

We are told that a "Green Christmas makes a fat churchyard," while a variation in Rutland has it that "A green Christmas brings a heavy harvest," and again, "At Christmas meadows green, at Easter covered with frost." In Germany a saying runs that "The shepherd would rather see his wife enter the stable on Christmas Day than the sun." Again, "A clear and bright sun on Christmas Day foretelleth a peaceable year and plenty; but if the wind grow stormy before sunset it betokeneth richness in the spring and autumn quarters." Another superstition runs that if the sun shines through the apple tree on Christmas Day there will be an abundant crop in the following year. Then, if there is a full moon about the 25th, we are assured that—

"Light Christmas, light wheatsheaf;
Dark Christmas, heavy wheatsheaf;"

while if it is windy on Christmas Day the trees will bring much fruit. In Germany the following rhymes are current:—

"So far as the sun shines on Christmas Day,
So far will the snow blow in May."

"A warm Christmas, a cold Easter;
A green Christmas, a white Easter."

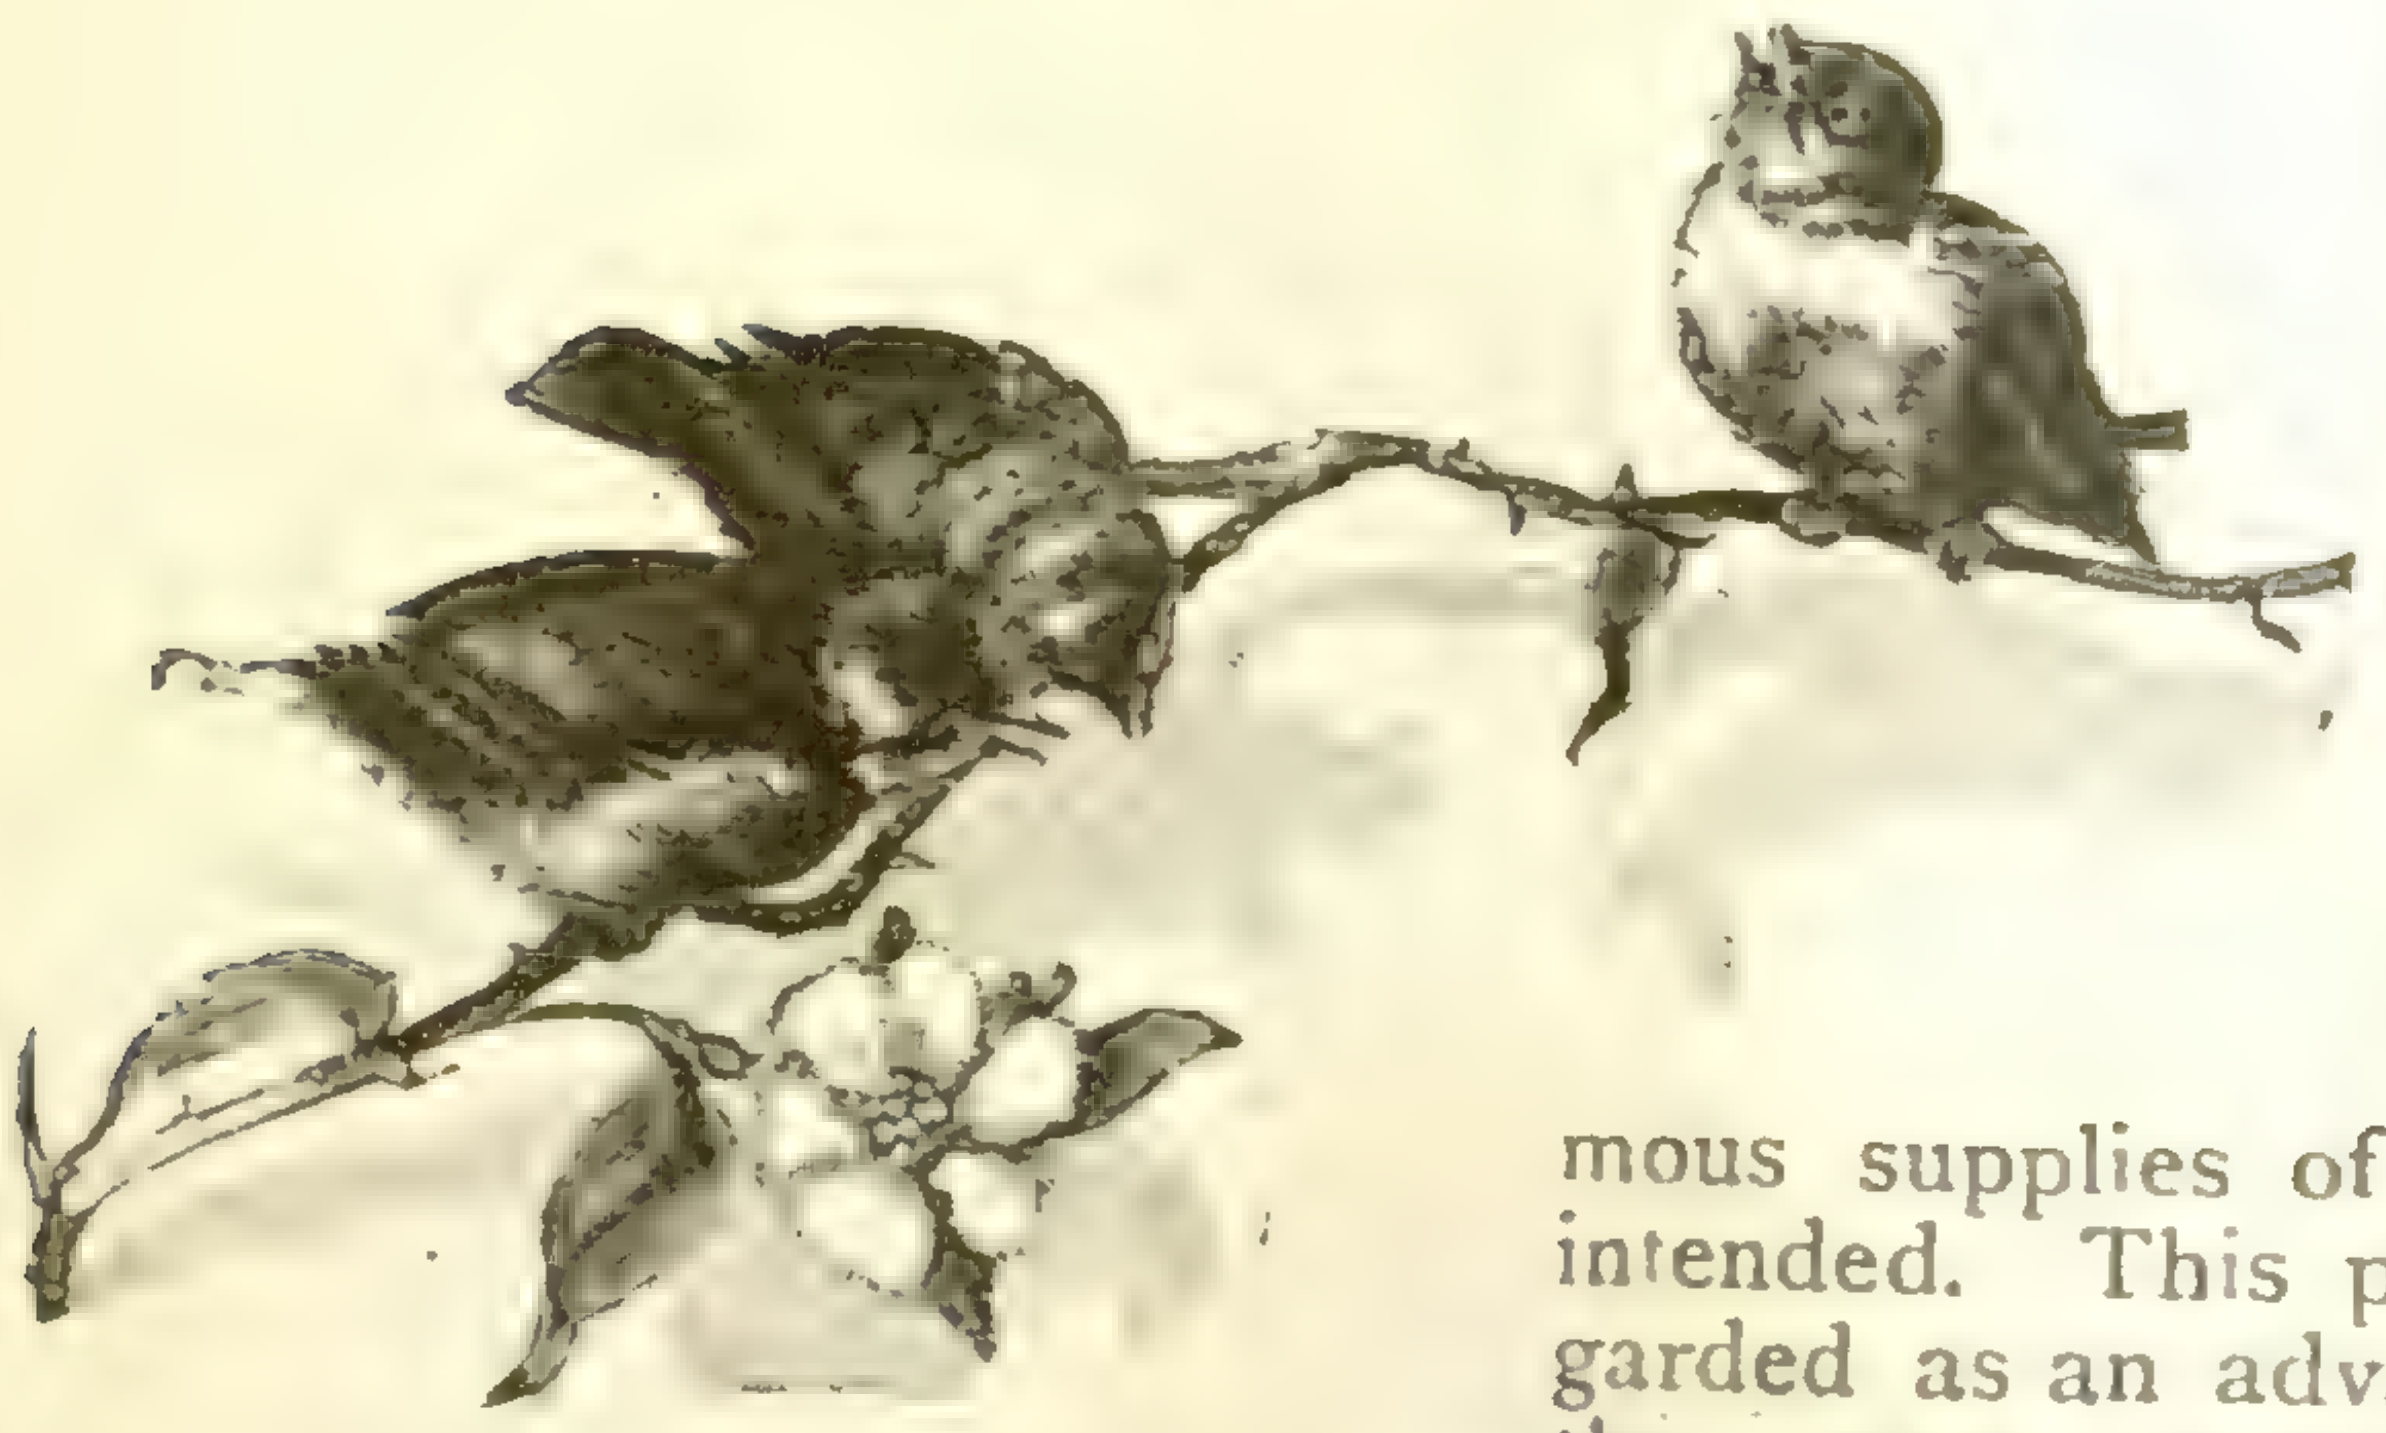
"Christmas in snow, Easter in wind;
Easter in snow, Christmas in wind."

Then again, if it snows during Christmas night the crops will do well, and, joyful news to Kent, if it snows on Christmas night good hop crop next year; while another says if Christmas be wet there will be an empty granary and barrel—which would be bad indeed, neither bread nor beer. Then we are also told in some parts that if at Christmas ice hangs on the willow, clover may be cut at Easter. A pleasing jingle relating to the weather runs:—

"If Christmas finds a bridge, he'll break it;
If he finds none, he'll make it;"

while in some places it is said that if the ice will bear a man before Christmas it will not bear a mouse afterwards, which in other parts again is remarked of a goose and duck. In Meath it is said that when the blackbird sings before Christmas it will cry before Candlemas. A windy Christmas and a calm Candlemas are signs of a good year, while in the vineyards of France they tell us that if on Christmas night the wine ferments heavily in the barrels a good wine year will follow. Much thunder during Christmas week denotes that there will be much snow during the winter, while the twelve days from Christmas to January 5 are said to be the keys of the whole year's weather, while if it rains during the twelve days after Christmas a wet year will follow. A method of superstitious divination formerly practised in France was the placing on Christmas Day of twelve onions, which represented the twelve months of the year. Each onion had a pinch of salt placed on the top, and if the salt had melted by Epiphany the month corresponding was put down as sure to be wet, while if the salt remained the month was sure to be dry. If Boxing Day is windy it is held to be bad for next year's grapes, and with this my selections must close. W. N. B.

ENGLAND'S ORCHARDS AT HOME AND ABROAD.



In consequence of the limits the Editor has found necessary to impose upon me in the matter of space I shall not be able to discuss the orchards whence the United Kingdom draws its enormous supplies of fruit so fully as I intended. This probably will be regarded as an advantage, for not even the most enthusiastic pomologist would derive much pleasure at this particular season from an examination of the multitudinous details that it would be necessary to give in a full treatment of the subject. I, however, had no intention of attempting the impossible, or, to be exact, of giving details of England's orchards, for are they not to be found in all quarters of the globe? tropical and temperate regions alike contributing their share to the fruit supplies of this country. The object I have had in view has been simply to show how great are our requirements in the matter of fruit and to indicate in some degree the countries from which our main supplies are obtained. In the consideration of the question of our fruit supplies it is eminently satisfactory to have undoubted evidence as to the increasing importance of fruit as an article of diet. A quarter of a century since such choice fruits as grapes and pineapples were during the winter months only within the reach of the wealthy, but now they are so inexpensive that the greater proportion of the middle classes are able to have them on their table with more or less regularity. Changes in other directions have cheapened and improved the supplies of fruit within the reach of the poorer members of the community. Notwithstanding the reduction in value, those who engage in fruit production on business lines appear to make a respectable profit, for we see them continually enlarging their borders. In some instances the values have been so reduced as to leave no margin for interest on capital, and what the economists designate the wages of superintendence, and many good men have unhappily gone to the wall as a consequence of the economic changes that have been brought about during the past twenty years.

Probably no greater change has been made in connection with fruit production of late years than in grape culture, and there can be no question that the community has immensely benefited from the largely increased production of these fruits. Happily the British orchards or vineyards fully maintain their supremacy, for no grapes the world has yet produced can compare with those grown at home. We have not only been able to hold our own in the British markets, but we have made some progress in obtaining supremacy in the American and French markets, where excessive duties greatly hindered us in our competition with the American and French growers. Twenty years ago we were largely dependent upon the German growers for supplies of grapes at prices that placed them within the reach of the middle classes, but the development of the grape-growing industry in the Channel Islands completely stopped these importations. Of late we have received large supplies from Belgium that have sold at low prices, more especially during the past autumn, these supplies being in a large measure due to the heavy duty excluding them from the French markets. It is estimated that the Belgian supply is equal to two hundred and fifty tons annually, a quantity which, if a small proportion only of the annual supply, is sufficient to depress the prices of the second-rate grapes. From the Channel Islands immense quantities of grapes are received in the English markets, the total being about two thousand five hundred tons. The English crop, which is of unsurpassed quality, is not less than one thousand tons. The total supply of grapes grown under glass is, therefore, three thousand seven hundred and fifty tons. In addition, the British markets are supplied with about half-a-million barrels of Almerian grapes, which, if thick skinned and flavourless, are, when of good quality, refreshing to the palate, and they afford the poorer classes an opportunity of tasting grapes. The British cultivator is also well able to hold his own in competition with the produce of the Californian, French, and Cape orchards, imported peaches being invariably tough and tasteless.

In the production of the pineapple for commercial purposes British cultivators have been beaten by the growers in the Azores, who with their great natural advantages are able to carry on the industry at a cost that is impossible in the United Kingdom. The first shipment of pines from St. Michael's was made during the sixties, and it is recorded that the fruits were sent over on the plants, and that fifty of them realised under the hammer £70. Previous to the shipment English pines were worth during the winter months from one to five guineas, and for some years afterwards Azorean fruits weighing from six pounds to seven pounds realised from £1 to £1 10s. each. This immense reduction rendered it impossible to grow pines for market otherwise than at a loss, and in consequence the commercial culture of the fruit died out. At the present time Smooth Cayennes, the variety chiefly grown in the Azores, weighing about six pounds, and in the finest condition, are offered in the fruiterers' shops at five shillings each. Whether this price leaves a margin of profit to the grower it is difficult to say; it cannot be a wide one, but it may be that it is possible to produce them on a large scale, with profit, at this price. However that may be, the industry has grown to enormous proportions, about 500,000 fruits being annually imported. The Azorean pines have nearly killed the trade in West Indian pines, so far as this country is concerned, and this is in no way surprising, when it is considered that second-rate fruits of the former can be sold at prices not greatly differing from those from the West Indian islands, while infinitely superior to the best.

Our own orchards contribute largely to the supplies of apples and pears in the British markets, but not to the extent they might, and indeed should do. The most important of the English orchards are in Kent, and from these much of the finest sent to the markets is produced. There are immense areas under apples and pears in Devon, Somerset, Gloucester, and Hereford; but, as so fully stated in the GARDENERS' MAGAZINE in the reports on the English orchards two years since, the orchards in these counties are in a deplorable condition. In some instances the trees are worn out or otherwise unproductive, and in others the varieties are so inferior as to yield fruit of but little value for market. This is very regrettable, for in no country are apples produced equal to those of Great Britain, and the demand for these fruits is simply enormous. In proof of this it will suffice to mention that in December, 1897, the imports of apples amounted to 1,186,464 bushels, of the value of £280,203, and that during 1897 we imported 6,177,192 bushels, of the value of £1,582,471. It is not possible to apportion the immense sum paid by Great Britain for apples last year among the several countries from whom we received supplies, but there can be no doubt that the greater proportion came from the United States, where are to be found England's largest apple orchards. From America, Canada, and Nova Scotia we receive supplies from the end of the autumn until the beginning of spring. These are followed by Tasmanian apples, which are received in considerable quantities during the spring and early summer months; and in the latter part of the summer and throughout the autumn Italian, French, and German apples are imported in large quantities. The fruit from these countries is inferior to that of home growth, but it comes to market in good condition and materially helps to depress prices. We cannot control the climate of this country, which is unquestionably fickle, but in ordinary seasons there should not be room for foreign apples in the English markets during the autumn.

Great Britain has long derived her principal supplies of pears from orchards outside of her boundaries, and unless some drastic reform is effected in methods of procedure she will continue to depend upon foreign orchards. There is considerable difficulty in making any great changes in the market culture of the pear, for that fruit is less certain in cropping than the apple, and if the weather happens to be unfavourable when the trees are in bloom, or the fruit is passing through its earliest stage, the crop will probably be lost. There are, however, some thousands of acres in the more favoured of the English counties on which pears might be cultivated with profit, provided suitable varieties were planted, the trees properly managed, and the fruit carefully packed. Williams's Bon Chrétien, Hessle, and Windsor are the varieties grown the most largely at home, but Pitmaston Duchess and Doyenne du Comice are favourite varieties for high-class trade, and both might be planted in much larger numbers, in districts favourable to the pear, with advantage. The earliest supplies of foreign pears come from France and Italy, and consist chiefly of Jargonelle, Louise Bonne of Jersey, and Williams's Bon Chrétien. During the autumn and early part of the winter large quantities of Williams's Bon Chrétien, Beurré Hardy, and Doyenne du Comice are received in excellent condition from California. The imports of pears from California vary, but in some weeks they have reached the respectable total of 5,000 cases. Easter Beurré, of Californian growth, is also received in large quantities during the winter, the imports averaging during December about 1,000 cases, and, as the fruit can be imported without being placed in the cool chambers, it keeps longer after arrival here than does the fruit of the varieties ripening in the autumn, which has to be subjected to cool storage. The Channel Islands, France, Germany, and Holland also send us considerable quantities of these fruits.

The market supplies of plums have increased by leaps and bounds of late years, as the result of increased activity on the part of home and foreign growers. The area of British plum orchards has of late been materially increased, and with more judicious selection of varieties and improved methods of management the newer orchards are giving good returns. The principal foreign supplies come from Italy, France, Belgium, and Germany, and extend over about three months, and from 10,000 to 15,000 boxes are sold daily before English plums are ready for the market. Our annual imports of plums now exceed a million bushels. Cherries are also imported in large quantities, the annual value of the imports being about £100,000, but as the fruit has to be gathered before it is ripe foreign cherries cannot compare with fruit of home growth. The imports of figs have materially increased of late years, the largest quantities being sent from the Channel Islands and France.

Oranges and lemons constitute a large proportion of our foreign fruit supplies, nearly all the countries in which these fruits flourish sending in large quantities. The orange supplies were so fully dealt with in the GARDENERS MAGAZINE Christmas Number of 1896 by Mr. J. R. Jackson that it would be superfluous to enter into details, and it will now suffice to say that the annual value of the imports of these fruits is above £2,000,000. Bananas, which are sent chiefly from Madeira and the Canary Islands, form a part of our fruit supplies, as indicated by the fact that between 30,000 and 40,000 bunches are received each month during the season in the London markets. As these fruits are not separately entered in the returns, it is not possible to state the exact number of bunches annually received, or the value of the imports, but there can be no doubt that bananas help very materially to swell the totals of the unenumerated fruits.

PLEASE MENTION THIS MAGAZINE.

NEW TEA-SCENTED ROSE "SUNRISE,"

Illustrated and Described in the "Gardeners' Magazine" for November 26.

THIS is one of the freest growing and most constant bloomers we have. In fact, it has never been out of flower, under glass, during the six years we have grown it; and is also a good bedder. An Award of Merit was given by the Royal Horticultural Society on October 25 of the present year. The following Extracts from the Gardening Press speak for themselves. Orders have already been received from prominent Rosarians, and we anticipate a large demand.

Extracts concerning Rose "Sunrise."

The Gardeners' Magazine, October 29.

"Mr. G. W. Piper, Uckfield, showed a pretty coppery-buff Tea scented rose named 'Sunrise,' a new form of great beauty."

The Journal of Horticulture, October 29, 1898.

"ROSE 'SUNRISE' (G. W. Piper).—A lovely Tea-scented variety that is deliciously fragrant. The under portion buff-apricot, and the outer side bright cerise (award of merit).'

The Gardeners' Chronicle, October 29.

"Mr. G. W. Piper, Uckfield, exhibited blooms and shoots of a new Tea rose named 'Sunrise, and an award of merit was recommended. It has very pretty little buds, and in point of colour is exceedingly attractive. Some of the outer petals are cerise-coloured, but the blooms have shades of copper and bronze."

The Garden, October 29.

"ROSE 'SUNRISE' (Tea).—This in its colouring, or more strictly combined colouring, is unique, the outer petals reddish-carmine, shading to delicate fawn and pale salmon within, the open blossoms of a pleasing yellow. The chief value of the flower is in the warmer tints that are so abundantly apparent as the flowers open, and these coupled with the bronzy foliage are charming. The flowers, too, are produced in great abundance, the buds being exceptionally well formed. From Mr. G. W. Piper, The Nurseries, Uckfield, Sussex."

Horticultural Advertiser, November 2.

"ROSE 'SUNRISE' (G. W. Piper).—A charming Tea-scented variety, most deliciously scented; a stand of blooms artistically arranged called forth many expressions of admiration. The flowers are salmon-apricot, outer petals bright cerise, the foliage deep bronze, which forms a fine contrast. We have seen the stock growing at home and the plants appeared very vigorous and free-blooming. Award of merit."

Healthy plants in pots will be distributed in May next, price **7s. 6d.** each; or **6** for **£2 2s.**

TRADE TERMS UPON APPLICATION.

All varieties of merit are grown. Our Stock this year is chiefly upon the Seedling Brier, and exceptionally well ripened.

A Descriptive Catalogue, drawn up on entirely new lines, free upon application.

JOHNSON'S

GARDENER'S DICTIONARY.

A New Edition, thoroughly Revised and considerably Enlarged.

BY

C. H. WRIGHT, F.R.M.S.,

AND

D. DEWAR (Curator of the Glasgow Botanic Garden).

New and Enlarged Edition (1,072 pp), with numerous Illustrations, demy 8vo., cloth, 9s. net.

"We are glad to see the publishers of this valuable work again in the field with a new edition, thoroughly revised and considerably enlarged. It is without doubt one of the most reliable and important gardening dictionaries that have ever been published; in fact, as a dictionary and guide for gardeners, amateur or professional, its equal is not to be found in horticultural literature. . . . forms a marvellous digest of matters horticultural, and a standard work for the guidance of all interested in the art and science of Gardening. It is beautifully printed, and the style in which it is turned out is highly creditable to the eminent publishers'.'—*The Horticultural Times*.

"The reissue . . . is so considerably enlarged and improved, after a lapse of thirty years since the last revision, as to be practically a new work. From a careful examination. . . . we find the revision and the additional matter deserving of all praise. Every gardener, and everyone who loves a garden, or owns one, should possess this book. With the best features of older works, such as 'Paxton's Dictionary,' it supplies also valuable information with regard to all kinds of gardening operations, culture, insect pests, and other matters of utility."—*Saturday Review*.

"For nearly half a century this Dictionary has been considered one of the leading works of its kind, and for handy reference on horticultural matters cannot be easily eclipsed The new edition has been ably revised and brought up to date, giving full and accurate descriptions of plants as well as cultural directions. . . . To amateur gardeners the work is a veritable encyclopædia."—*Garden Work*.

SANKEYS' famous GARDEN POTS

Bulwell Potteries, Nottingham.

Messrs. Dicksons, Limited, Chester, write: "The Flower Pots you have so largely supplied us with are light, strong, and well made, and in every respect highly satisfactory."

Messrs. Richard Smith and Co., Worcester, write: "We beg to say that we are highly satisfied with your Garden Pots. They are well made, light, yet strong, and we like them better than any other we have ever used."

Messrs. Fisher, Son, and Sibray, Limited, Handsworth Nurseries, Sheffield, write: "We have pleasure in testifying that after having used your pots for the past twenty-five years we have found them all that could be desired."

First Announcement after a Series of Highly Successful Experiments,

RESULTING IN

A MOST VALUABLE DISCOVERY!

OF SUPREME IMPORTANCE TO GARDENERS AND AGRICULTURISTS.

EFFECTUAL DESTRUCTION OF EVERY FORM OF FUNGOID DISEASE,

Including Mildew, Sleeping, Drooping or Flagging, Disease in Tomatoes, Chrysanthemum Rust, Potato Disease, Club, etc., combined with the most potent fertilization.

Tomatoes,
Chrysanthemums,
Vines,
Cucumbers, Melons, etc.,
Fruit Trees,
Cereals and Grasses,
Potatoes,

ARE SUBJECT TO FUNGOID DISEASES.

To find a Cure for these Fungoid Diseases has baffled the Skill of Practical Men for years.

THE CURE IS NOW FOUND!

and its discovery has crowned all previous scientific researches into the cause and remedy of FUNGOID DISEASES, for each and all of which we claim this new substance to be a certain and absolute cure.

Arresting the spread of disease in food-producing plants, and at the same time increasing their yield or crop, is a subject of vital interest and demands

MOST SERIOUS CONSIDERATION FROM EVERYONE.

NO MORE FUNGOID DISEASE

This New Substance has a dual power—
DESTROYING DISEASE GERMS OR SPORES, AND AT THE SAME TIME FERTILIZING PLANT LIFE.

RECENT NUMEROUS EXPERIMENTS PROVE that the yield or crop is INCREASED FROM 20 to 25 PER CENT. where it is applied. As an instance, the yield of potatoes is about 2½ tons per acre more where it is used, the tubers also are of better quality, being *entirely free from disease.* These advantages are secured at a cost of about 19/- per acre. Similar results are effected upon most of the food-producing plants.

The value of this combined power of Destruction and Fertilization is of immense importance, and cannot be over-estimated.

SPECIAL CARRIAGE PAID PRICES IN THE UNITED KINGDOM—

Per cwt., 25/-. Half cwt., 13/-. Quarter cwt., 7/-. 14 lbs., 5/-. 7 lbs., 3/-.

A Reduction in lots of One Ton and upwards.

This highly concentrated compound should be mixed with from 8 to 10 times its bulk of dry sand, ashes, or road drift, and be applied in the following proportions:—¾ cwt. per acre; ½ lb. per rod (30¼ square yards); ¼ oz. per square yard (superficial).

EXAMPLE FOR A CUCUMBER OR TOMATO HOUSE.	Each Side.	Two Sides.
90 feet long, each bed 3 feet wide, would require	½ lb.	1 lb.
90 " " " " 4½ " " " "	¾ lb.	1½ lb.
135 " " " " 3 " " " "	¾ lb.	1½ lb.
135 " " " " 4½ " " " "	1 lb. 2 oz.	2¼ lb.

GREENHOUSE PATHS and WALKS should always be dressed with the Compound, as it is there that spores frequently hibernate.

EXAMPLE FOR TOP DRESSING SOIL IN POTS:—

48 six inch pots, 35 seven inch pots, 27 eight inch pots, 21 nine inch pots, or 17 ten inch pots are approximately equal to one square yard, and would therefore require ¼ oz. of the compound.

Send for Prospectus containing full information, which will be Ready December 15th.

VEITCH'S GENUINE SEEDS.

James Veitch & Sons Ltd.
Chelsea.

TOMATO,
VEITCH'S GOLDEN JUBILEE.

First-class Certificate, R.H.S., May 26, 1897.

A splendid acquisition; one of the finest Tomatos of recent introduction, smooth in outline, of a beautiful golden colour, magnificent cropper, and of excellent flavour. **Per Packet, 2s. 6d.**

MELON,
FROGMORE SCARLET.

Award of Merit, R.H.S., Aug. 25, 1897.

This fine Melon was one of the few which received an Award of Merit at the Royal Horticultural Society this season. The flesh is very thick, and of exquisite flavour. **Per Packet, 2s. 6d.**

NEW POTATO, DEVONIAN.

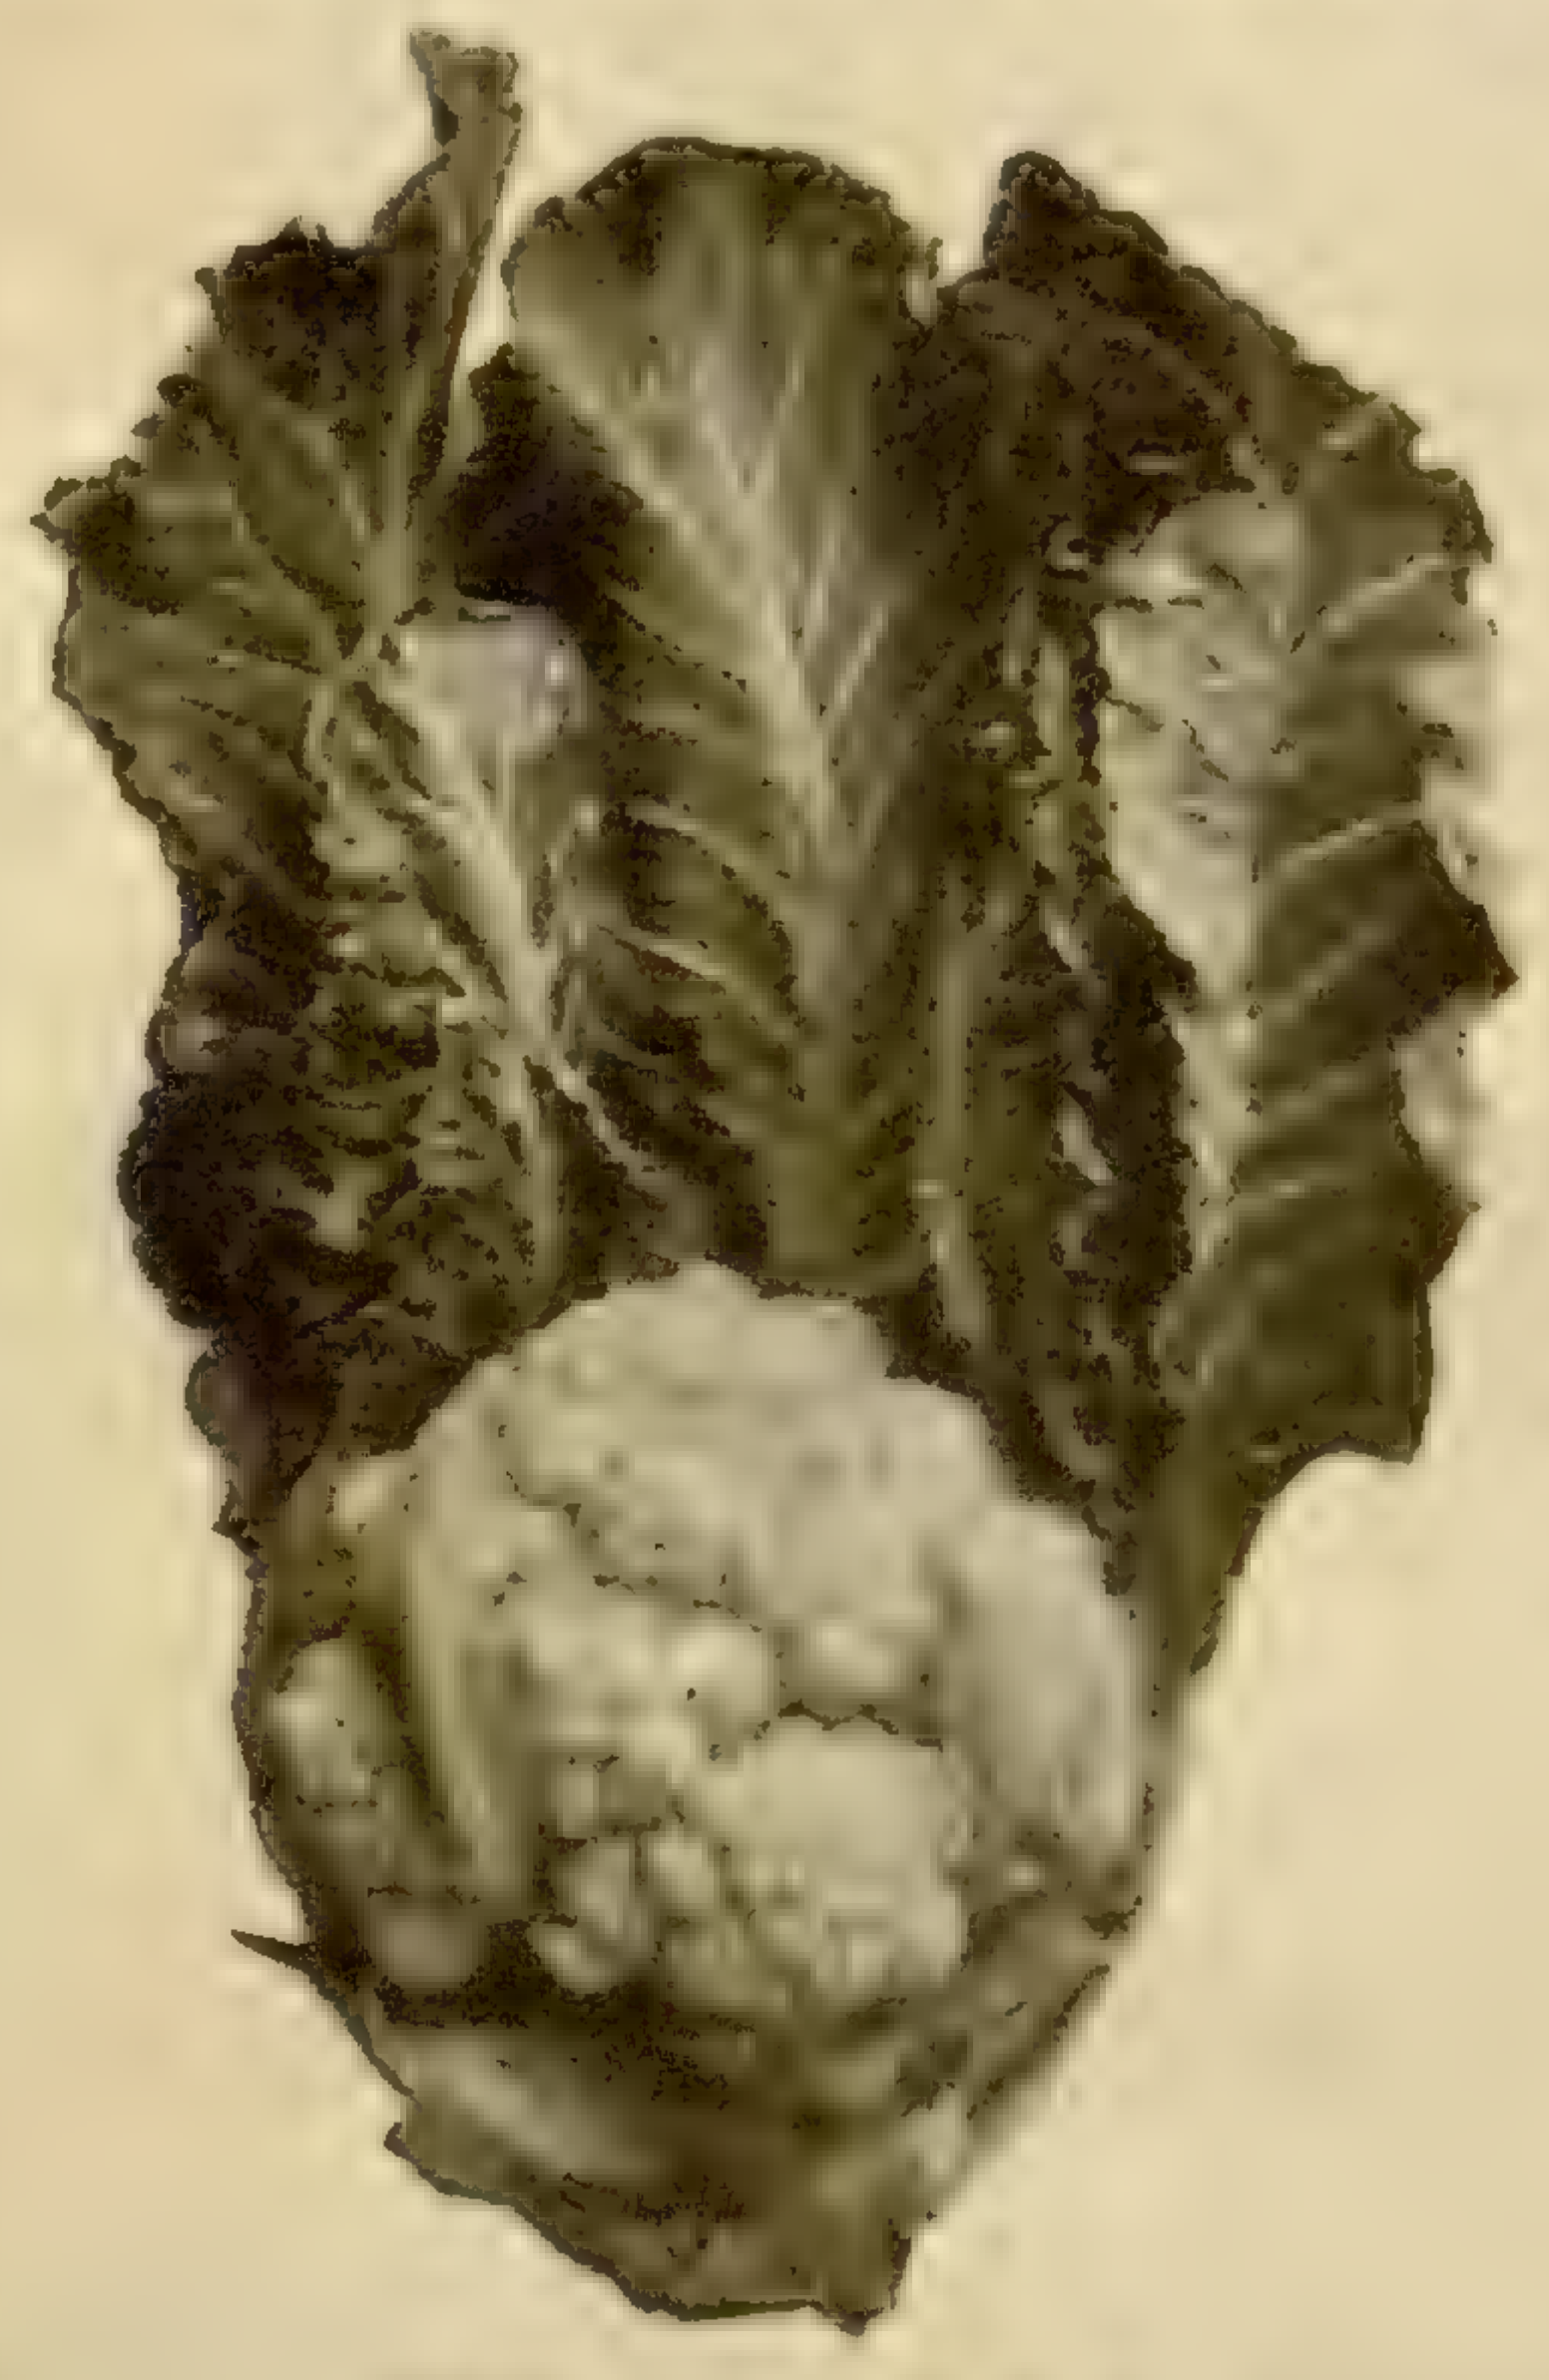
Award of Merit, R.H.S., Sept. 6, 1898.

A heavy cropping variety of kidney shape, with rough skin and few shallow eyes. **Per 14 lbs., 4s. 6d.**

POTATO,
SYON HOUSE PROLIFIC.

Award of Merit, R.H.S.

This variety may be classed as one of the best late kinds of recent introduction. It is an excellent keeper and a most abundant cropper. **Per 14 lbs., 4s.**



BROCCOLI,
VEITCH'S MODEL.

First-class Certificate, R.H.S.

This splendid variety well merits the high encomiums so frequently expressed in the Gardening Press, being the best and handsomest of all late Broccoli.

Per Packet, 1s. 6d.

FIRST CLASS
CERTIFICATE

NEW CUCUMBER,
VEITCH'S SENSATION.

Award of Merit, Royal Horticultural Society, Temple Show, May 19, 1896.

FIRST-CLASS CERTIFICATE, July 12, 1898.

Certificate of Merit, Reading Horticultural Society, July 14, 1898.

Smooth and perfect in outline, with a scarcity of neck, and of a handsome dark green colour, it is a very free cropper, and the flavour excellent.

Per Packet, 2s. 6d.

DWARF BEAN,
VEITCH'S PROGRESS (NEW).

Award of Merit, R.H.S., April 21, 1897.

A distinct and superior variety; very prolific, and remarkably early.

Per Packet, 2s. 6d.

PEA, CHELSEA GEM.

First-class Certificate, R.H.S.

The earliest dwarf wrinkled variety, and a much larger cropper than any other dwarf sort. Of splendid table quality. Particularly suitable for forcing and for very early use.

Per Quart, 2s.

LETTUCE,
VEITCH'S PERFECT GEM.

The best Cabbage variety for summer use. A most distinct, compact growing variety, of a rich deep green colour, forming very early a close, solid heart.

Per Packet, 1s. 6d.

CELERY,
VEITCH'S EARLY ROSE.

A beautiful rose-coloured selection of robust, compact growth, forming very solid hearts, which are crisp and of a fine flavour.

Per Packet, 1s. 6d.

HARLOW STATION, G.E.R.

H. J. JONES'S APOLOGY AND EXPLANATION

to his many friends and customers why their Chrysanthemum Cuttings have not been sent quite so quickly as usual.

I am sorry this has been the case, but I know my customers will forgive me when they know it is caused by the great increase of business from the widespread knowledge that THE RYECROFT RESTED STOCK HAS NOT BEEN ATTACKED BY RUST, and that it is the healthiest and best in the world (Don't believe me! come and see for yourself). It was represented this season on nearly every prize winning stand all over the United Kingdom. Orders have poured in at such a rate that my usual Chrysanthemum Staff could not cope with them, hence the slight delay in delivery. I have now added to my Chrysanthemum Staff, and can despatch orders within four days of receipt. Any of my customers who do not receive their cuttings in four days from despatch of order, kindly send me a card.

My Chrysanthemum Catalogue, including a special article on Stopping and Timing nearly 600 varieties, post free, 1d.

A New Edition of my Chrysanthemum Guide in preparation, post free 7 stamps; 1s. 2d. bound in cloth.

My List of Novelties is also in preparation. This contains the finest varieties that have been offered for years, both in Seedlings and Sports from the best varieties in commerce. Don't order your new varieties until you see this.

RYECROFT NURSERY, LEWISHAM.

Situations Wanted.

Adver.isements under this heading are charged 1s. each, four lines (32 words), and 3d. per line after. A Copy of the "Gardeners' Magazine," Post Free, 2½d.

THE GARDENERS' MAGAZINE.

SATURDAY, DECEMBER 24, 1898.

RUGBY CHRYSANTHEMUM EXHIBITION, WEDNESDAY and THURSDAY, NOVEMBER 15TH and 16TH, 1899.
8, Barby Road. WILLIAM BRYANT, Secretary.

HORTICULTURAL CORRESPONDENCE CLASSES.—For PROSPECTUS and LIST of PRIZES apply T. H. SMITH, 18, Somerville Road, Small Heath, Birmingham. First Examination Paper ready November 5. Join early for the whole course.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at One Shilling per line, the minimum charge being Five Shillings. Advertisement Office, 148 and 149, Aldersgate Street, London, E.C.

NOTICE TO ADVERTISERS.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

THE POSSIBILITIES OF THE SWEET PEA.

THE possibilities of the sweet pea in regard to its productive powers are much greater than are generally supposed. An experiment was made last season by way of arriving at some conclusion as to the number of seeds a few individuals would produce; five seeds of Blanche Burpee produced the astonishing number of two thousand three hundred and fifty-three seeds, and this after a dozen bunches of sprays of bloom had been gathered from the plants. This heavy seed production means bounteous crops of bloom, and an experiment made by putting individual seeds into the ground, a yard apart, resulted in the plants each producing from four hundred to five hundred sprays of blossom. When a raiser has a particularly fine variety, of which he wishes to obtain a quick and large increase, he will place an individual plant where it can branch freely, and then the cultivator sees displayed a capacity for expansion that is positively startling. Anyone interested in this fragrant flower can experiment for himself, and he can scarcely fail to be surprised at the results. The fact is our ordinary methods of sowing our culinary as well as our sweet peas admit of great improvement. The seeds are sown thickly in drills, and the result is often practically starved plants. The force of growth in the individuals is fettered by lack of adequate root room and food; the very nature of the plant craves expansion, but, like a prisoner whose feet are chained to the ground, the area of action is restricted. If anyone desires a further illustration of the possibilities in sweet peas, let him sow five seeds of one variety, in a pot, about the end of February, raise the seedling plants in a cold frame, and keep them dwarf and sturdy, and as they come on place twigs among them to keep them from clinging one to the other, and then plant them out as undivided clumps four feet apart, digging a hole eighteen inches in depth, placing in it a good spadeful of rich manure, putting some good soil over this, and then plant, disturbing the roots as little as possible, in a good open, sunny position. Plants so treated should be in bloom by the middle of June. Last summer we saw some sixty-four plants which had been treated in this way, and at the end of July a small cartload of bloom could have been gathered. Good cultivation is necessary, in so far as it is shown in attention to watering, and preventing any stray shoots from falling aside, and directing their upward growth as much as possible. When these services are rendered, every seed may be calculated upon to produce a plant that will yield, on a rough average, two hundred sprays of blossoms. This is the result, not merely of growing, but of actually cultivating the plants. It is now becoming difficult to make a small selection of sweet peas, so numerous are the varieties, for, in addition to those constantly being raised in our own country, America sends several novelties every season.

TOO MUCH ALIKE CHRYSANTHEMUMS.

THE discussion of the question of too much alike chrysanthemums, which originated shortly after the November exhibition of the National Chrysanthemum Society, continues to drag itself along, and the chief point of interest connected with the discussion is the proof it gives of the possibility of writing and speaking much upon a subject without throwing any light upon it. The question is in reality a very simple one and might be readily understood by anyone conversant with chrysanthemums who is prepared to inform himself of the facts of the case. During the past few years several varieties, chiefly belonging to the incurved section, have been introduced that bear so close a resemblance to the older forms or to each other as to render it difficult to distinguish them at certain stages of development. The similarity of appearance of the blooms of the varieties in question when cut and placed in the exhibition stand gave rise to considerable discussion at many of the shows and not a little vexation. In some cases disqualification followed when two varieties closely resembling each other were included in a stand in which distinct varieties were required, to the annoyance of the exhibitor; and in other cases, where the judges gave the exhibitor the benefit of any doubt they may have had, there was much discussion among the other competitors. In some instances blooms of the same variety were shown under two distinct names, this probably being done through exhibitors attaching more importance to the names on the labels than to their own judgment. With a view to protect as far as possible exhibitors from the risk of disqualification, and to remove a cause of vexatious discussions at exhibitions, the executive of the National Chrysanthemum Society appointed a special committee to deal with the question, and as the result of their labours they, following the lead of the National Rose Society, prepared a list in which certain varieties were bracketed together as being too much alike to be shown in the same stand. This list was adopted, and printed in the society's last annual report, with a stipulation that competitive collections should be shown in accordance therewith. With one exception, and that was a mere inadvertence, the rule was observed by the whole of the exhibitors, with advantage to themselves and the judges. Much has been said and written in reference to whether the list of too much alike varieties was binding upon affiliated societies or not; but there has really been no ground for discussing this point. The rules of the National Chrysanthemum Society prescribe that in classes in which the society's medals are offered by affiliated societies the nomenclature and classification shall be in accordance with the society's catalogue and any subsequent report, but they impose no other restriction. The majority of those who have taken part in this discussion appear to be unacquainted with the rules of the parent society relating to the affiliated bodies, and consequently are unaware of the fact that the annual report, as well as the catalogue, is included in them. It would be an advantage were the list of too much alike varieties to be adopted by the affiliated societies, and we are pleased to learn that at the meeting of the General Committee of the National Chrysanthemum Society held on Monday it was resolved to send a copy to each affiliated society, and invite it to make it compulsory in all classes.

IMPORTS OF FRUITS AND VEGETABLES.

THE returns issued by the Board of Trade for November are on the whole satisfactory, both exports and imports showing moderate increases on the month. With the exception of lemons, the whole of the fruits specified in the returns show substantial increases, as also do the imports of onions and unenumerated vegetables. The imports of apples amounted to 811,788 bushels, of the value of £250,500, against 783,300 bushels, of the value of £232,251, or an increase in quantity of 28,488 bushels, and in value of £17,249. Grapes were received in considerably larger quantities, the total imports being 199,470 bushels, against 122,341 bushels last year, or an increase of 77,129 bushels. The values of the grapes imported were £95,345 and £57,382 respectively, or an increase of £37,963. Nuts show an enormous increase, and a considerable proportion of this is probably due to the increased importation of cobnuts, which are now being largely grown in France, and coming into competition with the produce of the Kentish plantations. The value of the imports of nuts during the month is £157,188, against £89,294 in November, 1897. Pears were imported in larger quantities than in the corresponding month of last year, the quantities being 47,092 bushels and 46,674 bushels respectively, and the values £23,275 and £19,072, the latter indicating a material increase in the price per bushel. The imports of plums in November continue to increase. This year they amounted to 1,194 bushels, of the value of £414; in 1897 to 884 bushels, of the value of £3,500; and in 1896 to 15 bushels, of the value of £30. The imports of unenumerated fruits also continue to increase, and last month they amounted to 108,804 bushels, of the value of £50,107, against 63,670 bushels, of the value of £32,617. Potatos, on the other hand, show a material decrease, for we received 23.323 cwt. only last month, against 145,028 bushels in the corresponding month of last year; the greatest drop in the case of any one country was in the supplies from Germany, these amounting to 19,207 cwt., against 225,898 cwt. last year. The value of last month's supplies was £23,323, against £145,028 in November, 1897; but our bill for the year's imports will be a heavy one, for it already amounts to £1,899,941. Onions were received in larger quantities than in the two preceding years, the total imports having been 665,631 bushels, of the value of £80,608, or an increase in quantity of 180,101 bushels, and in value of £25,997, a fairly good sum to pay for an esculent which can be cultivated without difficulty in the United Kingdom.

The Chrysanthemum.—Reviewing mentally the galaxy of bloom which formed the main attraction to the exhibitions held during the past two months, and recalling the insignificance of the blossom from which that gorgeous array has been slowly developed, we are forced to the conclusion that no parallel exists in any other flower. We may well pride ourselves upon our roses, our dahlias, our begonias, primulas, and other flowers whose original beauties have been enlarged, elaborated, and varied in tint and habit to a truly marvellous extent, but in no one of these has the innate capacity for variation displayed itself to such advantage as in the chrysanthemum, not merely in one or two directions, but practically in all, save, perhaps, in the direction of perfume. An extraordinary feature in this, and a very important one from the selective cultivator's point of view, is that this varietal power is not due, as in many other highly-developed flowers, to hybridisation. There are no combined and maybe antagonistic specific potencies at work in the blood or sap of the plants, the outcome of which are compromises which take the form of new variations either in bud or seed, all the variations originate *per se* in plants of the same species under high culture and keen observation of differences of type or tint. This high culture has also led to a remarkable capacity in the plants of many varieties for concentration of energy in comparatively few buds when the great majority are removed. It is this capacity which gives us the enormous blooms with which we are familiar, and here again we are safe in saying that the chrysanthemum is unique in its power of adaptation to this checking process in one direction and of diverting its energies in another to the greatest advantage of the favoured buds. We may prune our roses and dahlias almost to death on similar lines, but we shall not obtain similar enhancement of size, and at a certain point we are simply the poorer numerically. Then, again, in diversity of form the chrysanthemum is an easy first among the flowers of the world, and, vast as is now the number of distinct types, every season adds some unexpected outbreak in a new direction. One season gives us a bloom bristling with hairy excrescences, in another the pointed petals, after curling and twisting and lengthening in all conceivable styles, break out into tasselled ones, forming a fringe, and this season we have some marvels of slender elongation, such as What Ho! exhibited recently, which, though too eccentric for the connoisseur's taste, displays none the less the versatility of the flower, its long, lax, slender curly petals falling around like a floral cataract. The warmth of coloration, too, is gradually improving, some recent varieties approaching very near the true crimson and scarlet, while the snow whites and the golden yellows have reached the perfection of purity. When, finally, we consider that all this wealth of blossom is in its prime at a period when most flowers are over, and that even when left to themselves the plants are as hardy as grass, and will afford abundance of bright, though smaller, blooms as a counterpoise to even the fogs of November, we may well be thankful to Nature for such a floral gift, and to those who have raised it to its present superexcellence.

The Glastonbury Thorn (*Cratægus oxycantha var. præcox*).—This old and precocious variety is, writes Mr. F. W. Burbidge, now in bloom in the Trinity College Ball Gardens at Dublin. The plant was received direct from Glastonbury Abbey some years ago, and has flowered every year since, but this year it is a month earlier than usual—old Christmas Day, or our twelfth day, being its usual time.

The Late Dr. Allman's Garden.—George F. Wilson, Esq, F.R.S., writes from Heatherbank, Weybridge Heath, as follows with reference to the late Dr. Allman's garden: "A very eminent scientist recently died at Parkstone, near Bournemouth, who had been for some years a devoted and successful gardener, and had a collection of very interesting and rare shrubs which flourished in his mild climate; it was a great pleasure to see him in his garden, and at eighty-six he remembered most of the names without referring to labels. A great traveller and author, also a very successful gardener, who lives close by Ardmore, writes me: 'Dr. Allman's house and garden will soon be for sale, try and get some good gardener to buy it, it is full of rare and fine things.' To any old gardener wishing for a nice house and attractive garden in a mild climate this would give a good chance and to my friend a congenial neighbour."

The Gardening Year Book and Garden Oracle.—The edition of this popular annual for 1899 is now published, and can be obtained of all booksellers and newsagents. This issue has been thoroughly revised, and in great part rewritten, and will fully maintain the high degree of popularity the work has enjoyed during the past forty years.

The Catalogue of the Lindley Library, which has been in preparation for several years past, is now published, and will be heartily welcomed by Fellows of the Royal Horticultural Society and others who are resident within a short distance of the metropolis, and thus able to take advantage of the library. As well known to those familiar with the horticultural events of the past forty years, the International Horticultural Exhibition, held in London in 1866, resulted in a substantial profit. Of the surplus the sum of £1,000 was handed over to the Gardeners' Royal Benevolent Institution, and the remainder was expended in the publication of a full report of the exhibition and congress and the purchase of the library of the late Dr. Lindley. As at that time the Royal Horticultural Society possessed but few books, the Lindley library was handed over by the committee of the exhibition to a body of trustees, for the benefit of the Fellows of the society and other persons. Soon after its foundation a presentation of valuable books was made by Her Majesty the Queen, and additions of books and pictures by donation or purchase have been made annually, so that the publication of a catalogue had become an urgent necessity. We have, therefore, much pleasure in recording the publication of the catalogue, for which the small charge of half-a-crown is made. It will be found of immense value to those using the library, but it falls considerably short of our expectations, for with but few exceptions the whole of the books are entered under the name of the authors only. This we regard as a serious defect, for unless the reader is acquainted with the names of the authors of the works on the subject in which he is interested he will, in using the catalogue, be compelled to wade through the whole of the one hundred and sixty odd pages. The titles of the works should certainly have been given in alphabetical sequence, and it would have been a decided advantage had the books been arranged according to the subjects dealt with. These cross-references would have increased the cost of preparation and printing, and it may be that the funds at the disposal of the trustees prevented their making the catalogue so full and complete as we could have wished to see it.

National Amateur Gardeners' Association.—The annual dinner of this flourishing society was held at the Holborn Restaurant on the 15th, and was generally regarded, and properly so, as one of the most enjoyable social functions of the year. Mr. T. W. Sanders, the president of the association, occupied the chair, and about one hundred and fifty members were present. Both the president and the hon. secretary (Mr. Leonard Brown) were able to give a highly satisfactory account of the work of the association; and Mr. Fife, Mr. Waterer, Mr. Crane, Mr. Gordon, and other speakers bore ample testimony to the work that is being accomplished. The several trophies presented to the successful exhibitors during the year formed a very attractive exhibition of the silversmith's art.

Mr. A. F. Barron has, we regret to learn, found it necessary, in consequence of impaired health, to retire from the position of secretary of the Royal Gardeners' Orphan Fund, which he has held since the foundation of the charity, on the completion of the year's work in February next.

Cut Seed Potatos.—The old-fashioned method of cutting potatos used for planting has given rise to much controversy, and by an important section of cultivators the practice is considered to be both unprofitable and undesirable. The crop is considered not to grow so strongly or to yield so satisfactorily when cut sets have been used as when the potatos have been planted whole, and, further, the plan pursued by many of planting small seconds or inferior tubers in the belief that they are improving on the cutting process and at the same time effecting economy in the use of seed has been proved to be a short-sighted one. It is not suggested that the very best or largest potatos should be selected for seed, but all careful investigations go to prove that it is false economy to rely on improperly developed tubers for the succeeding crop. This truth has received fresh confirmation in the results of experiments conducted last summer at the Cheshire County Council Agricultural and Horticultural School, Holmes Chapel. Cut seed and whole tubers of various sizes were experimented with, and the lessons are clear and unmistakable. Much the best returns were obtained from the whole seed that would not pass through a 2½ in. riddle, the yield in this case being at the rate of 16 tons 14 cwt. per acre saleable potatos, and 19½ cwt. small, compared with 11 tons 8 cwt. saleable and 1 ton 2 cwt. small from seed that would pass through the 2½ in., but not through the 2 in. mesh; and the yields were still less where smaller sets were used, the sets that passed through 1½ in., but were retained in a 1¼ in. riddle, giving only about 8 tons gross, or scarcely half the weight produced by the largest size seed. Potatos cut in the ordinary way gave disappointing returns, but it was found that cut seed is substantially enhanced if the tubers are cut a week or so before they are intended for use and dusted over with slaked lime, as we have frequently advised. The lime causes a crust to form over the wound, and thus prevents the sap from exuding and the set from shrinking.

Seeds and Music.—It is evident the handling of seeds is in no way detrimental to the study of music, for not only is the musical talent shown at the annual festive gatherings of Messrs. Hurst and Son of an exceptionally high order, but a society in association with their seed house has been formed for the promotion and cultivation of musical taste and talent. The society hopes by organising systematic and regular practices to announce occasional musical evenings at a convenient central place, to which all members will be invited. It is also contemplated to offer prizes for vocal and instrumental competitions. We shall hope to see the society doing more than providing musical evenings for its members, as judging from the excellence of the vocal music at the annual dinner on Saturday last, and the splendid performance of the orchestra under the direction of Mr. Edward Sherwood, it should in due course be able to render good service in the cause of the charities associated with gardening.

The Starling a Friend of Gardeners.—Although we fully believe the starling is a friend, and treat the bird as such here, yet, nevertheless, we find the East Anglian starling, writes S. P., likes a little more variety in fruit than his brethren of Wiltshire (see page 780, December 3). In common with the rook he is very fond of cherries, generally taking a few from the tops of high standards or from the tops of trees on walls, especially in early morning. He does not object to a few red currants from a north wall, and in dry seasons, like the past, will pay an occasional visit to the strawberry beds. But, altogether, the starlings do us very little damage, and we cannot regard them in any sense as wholesale depredators in the matter of fruit, but they destroy large numbers of certain insects. Both myself and children were lately interested in watching them after the few stray apples left for them on some trees near our house. We do not molest the birds or their nests, consequently starlings are both tame and numerous here.

Allotments and Small Holdings in Lincolnshire.—There was recently a large gathering of small holders at Spalding Corn Exchange, most of those present being occupiers of small holdings belonging to Lord Carrington, and rented through a syndicate of local gentlemen for the purpose of encouraging the cultivation of small holdings, now very successfully carried on in the Spalding district. Mr. Richard Winfrey, chairman of the syndicate, stated that the movement was started in 1890, and, taking nineteen parishes round

Spalding, there were now some two thousand acres of land devoted to allotments and small holdings. Of this quantity Earl Carrington had provided no less than four hundred acres. The experiment had proved an unqualified success, and he attributed it to the fact that they had found reliable working men who knew their business, who had been put on the land under ordinary conditions and left to work out their own salvation. Earl Carrington was present, and mentioned that when this movement was started in Buckinghamshire there were predictions of failure, but these had been falsified. He did not take any credit to himself for providing the land; the thanks of the community were due to the holders for the way in which they had worked out their own salvation. He believed that if one farm out of ten were devoted to small holdings, so that the people were enabled to live upon the soil, a very serious labour question would be solved—namely, that farmers would not have to complain of the scarcity of strong, willing, able, adult labour in rural districts. Just as they had solved the labourers question, so could the tenant-farmers improve their position by working on co-operative principles. He held (the Minister of Agriculture notwithstanding) that Parliament could do a great deal for the tenant-farmer, and he urged the importance of the recommendations of the Royal Commission on Welsh Land that no tenant-farmer should be disturbed in his holding excepting for non-fulfilment of conditions and non-payment of rent, and also that in any rent dispute between landlord and tenant the matter should be settled by an outside and independent party.

Mr. J. Lazenby, who for the past quarter of a century has occupied the position of secretary to the Ancient Society of York Florists, is, we regret to learn, retiring from the office in consequence of the duties having become so heavy as to unduly tax his time. During the secretaryship of Mr. Lazenby the list of members has shown an enormous increase, and the chrysanthemum show has become one of the leading exhibitions of its class in the United Kingdom, while the four minor shows have acquired considerable importance. The retirement of Mr. Lazenby has created a desire among the members and friends of the society to present him with a testimonial in recognition of the valuable services he has rendered, and steps are being taken to afford an opportunity for the gratification of this desire.

The Power of Nature over the Arts of Man is exemplified in a remarkable degree in the Caroline Islands, especially in connection with the marvellous ruins of Nan-Matal which Mr. F. W. Christian has of late explored. In a most interesting lecture given before the Geographical Society Mr. Christian gave a graphic description of the manner in which the ruins at Nan-Tauach had become overgrown by trees and climbers. Standing, he says, on the south-west angle, where the wall is nearly forty feet in height, one looked down upon a green abyss of nodding woodland, with never a glimpse of the network of canals rippling below. The north-east angle is occupied by an enormous banyan tree, towering full fifty feet above the masonry in which it stands firm rooted, thrusting its bunches of thread-like root-fibre into every crevice. These as they swell exercise a constant and gradually increasing force, wrenching the blocks out of place. When a high wind blows the structure is rocked through and through in every joint and keystone. Sooner or later, if nothing is done to remove the tree, this side of the wall will settle down into ruins. A tangle of weeds, grasses, and creepers thickly carpets the precinct. Beyond the two small cross-walls on the inner side of the great outer wall on the south-west side is a remarkable slab, inclining to a crescent shape, balanced on two solid shafts projecting out of the masonry. This, when tapped, gives a clear, ringing sound, and was probably used for an alarum or for a sort of a bell in sacred ceremonies. Beneath, the terrace fronting the waterway is overgrown by a belt of young cocoa-palms of recent growth. News of the excavations, and of the havoc being made in the jungle in clearing operations, finally reached the ears of King Paul, who at once put a stop to the work. Most unfortunately, his superstitious terrors were confirmed by a very severe epidemic of influenza that broke out in the tribe shortly after their departure, and carried off many of the Metalanim people. Thus the work of exploring this wonderful Micronesian Venice has had to be abandoned for the time being.

Palm Oil, Rubber, and Kola from the Gold Coast.—According to a Colonial Office Report just issued the trade of the Gold Coast Colony has increased during the past year. The imports amounted in value to £784,188, and the exports to £857,793, the largest trade in any year since 1890 except 1895. The imports are mainly cottons, woollens and silks, spirits, hardware, rice, flour, provisions, tobacco, and building materials; and the exports palm oil and kernels, rubber, gold dust, timber, and minor products—such as coffee, cocoa, monkey skins, and kola nuts. Of the imports, over two-thirds are from the United Kingdom, and about the same proportion of the exports is taken by this country. The supply for exports of such staples as palm kernels and palm oil has not been satisfactory, but the export of rubber has largely increased, and last year amounted in value to £419,813, and in quantity to nearly five million pounds weight. The chief fear as regards the rubber industry, which is one of the chief sources of wealth to the colony, is the destruction of the trees by the natives in their improvident efforts to obtain as much sap as quickly as possible, and it may become necessary for the Government to intervene and issue licences in order to save the trees. Unfortunately the rubber districts are those which are most deadly to Europeans, and the cost of carriage on the heads of natives is considerable. Both these circumstances naturally retard the industry.

Influence of Football on the Seed Market.—At first sight it is difficult to conceive that football should have an influence, however remote, upon the seed market, but it is evident there is some connection between the two. In a recent report of the London seed market it is stated that there has been a steady decrease in the sale of canary and other seeds, and this has been traced to the fact that huge numbers of people, especially in the North of England, who used formerly to keep cage birds or devote their leisure to small gardens, now give all their spare time and interest to football.

Mildness of the Weather.—Mr. G. J. Symons, F R.S., states that he has had prepared abstracts of the meteorological observations made here during the forty years 1858-97. From them it appears that the highest minimum (*i.e.*, the warmest night) in December was that between December 27 and 28, 1882, when the temperature did not fall below 52·8 deg. This has been beaten on two nights of the current month, the minimum of the 5th being 52·9 deg., and on the 6th 53·9 deg, or 1·0 deg. above any other December night on record at Camden Town. It has been hotter for a short period in December previously, notably on December 5, 1888, when the maximum reached 58·9 deg., or 1·8 deg. higher than on the 4th in 1898, but for uniformly high temperature he can find no parallel to the night temperatures of the 3rd, 4th, 5th, and 6th inst., which were 51·8, 55·1, 55·0, 50·3 deg. respectively.

Open Spaces and the Diamond Jubilee.—Lord Hobhouse, the chairman of the Queen's Commemoration (Open Spaces) Committee, informs us that during the two years of its existence the committee has accomplished much useful work. The committee was formed by the four London societies which specially promote the extension and improvement of open spaces for the purpose of suggesting to the public that one highly fitting mode of celebrating the sixtieth year of her Majesty's reign would be by dedications of parks and other open spaces to public use. The committee confined itself to presenting the idea, stating reasons in its favour, and tendering offers of practical advice, which the experience of some of the members enabled them to give. "In this sense," continues Lord Hobhouse, "we addressed local authorities throughout the kingdom. The great bulk of our addresses went to authorities with a very small range of power, such as parish councils, and from them comparatively few replies were received. In fact, we did not expect it to be otherwise, owing to the novelty of their existence, and seeing that the want of open spaces is little felt where people are not closely packed. So far as we know, the villages mostly contented themselves with bonfires and suppers, the oldest, simplest, and most universally acceptable form of jubilation, lacking only in permanence, save perhaps for an indigestion here and there. The plan was more suited to larger communities, and, excluding London, there are sixty-nine places known to us in which schemes of the kind suggested by us have been carried into effect, most of them being dedications of some open space as connected with the long reign of Queen Victoria. In London, for obvious reasons which we stated publicly, we took the course of advocating special schemes and appealing for money. Five schemes were placed by us before the London public, of which one has failed, and the other four have taken, or will shortly take, effect, and stand as permanent memorials of the Queen's reign. In addition to these there are also three other schemes of smaller dimensions that have been carried through. We are not pretending that the committee has effected these results by itself; that has been done by the systematic efforts of the open space societies, the public spirit of local authorities, and the open hands of private donors. What we have done is to keep these matters before the public and the authorities, to support them with our machinery and our experience, and to urge the connection of these operations with the great anniversary of 1897. On terminating the existence of the committee, we find that the direct results of our action have been such as to exceed our expectations."

Weed Destruction.—With regard to the destruction of some of the most common weeds, it seems to be more than probable that the time is near at hand when the farmer will be in a position to rid his crops of them without any form of mechanical aid more costly or troublesome to work than a simple spray. The familiar charlock is the weed whose career is threatened by the recent discovery. A Frenchman seems to have been the first to make the discovery that this weed, in its favourite haunts among corn crops, could be destroyed by spraying the field with a solution of sulphate of copper without inflicting any material injury on the cereals. Last spring the suggestion was put to the test in Essex and Northumberland with encouraging results, and we learn that Professor Somerville, of the Durham College of Science, Newcastle-on-Tyne, is planning an extensive and searching system of experimentation for the spring of 1899. The efficiency of the treatment is already established almost beyond doubt, but it will be well to be sure as to the safety of the cereals before its general adoption is advised. No doubt Dr. Somerville's theory that the charlock succumbs because of its rough horizontal leaves retaining the poisonous dressing while the grain plants escape on account of the liquid being unable to settle on their smooth and erect stalks and leaves is the correct explanation of the faculty of discrimination which the results seem to attribute to the dressing. The results of the projected experiments will be waited with widespread interest, for many thousand acres of land are infested with charlock to the great injury of the useful crops. The hoe, however, is the best weed destroyer.

The Value of Leaf-mould as a manure is not so generally recognised as it should be, and, with reference to the matter, a correspondent asks: "Can anyone reasonably wonder at the destruction of trees which goes on in the London parks and elsewhere who notices that the fallen and dead leaves are promptly swept up and carted away or burnt?" and then proceeds to observe: "Thus the natural and necessary nourishment of the soil is deliberately removed; so that the earth becomes almost as barren as the Desert of Sahara." The superintendents of the public parks are not wholly to blame in the matter, for were they to allow the leaves to remain for the purpose of enriching the soil they would come in for much criticism from those who are ignorant of the fertilising properties of decaying leaves.

Messrs. Hurst and Son's Employees were, in accordance with the custom that has obtained of late years, entertained at dinner at the Holborn Restaurant on Saturday evening. Mr. N. N. Sherwood, the head of the firm, presided, and the guests, who included a few of his horticultural friends, numbered about one hundred and fifty. The function was eminently successful in every detail, and was of special interest as showing the good feeling which pervades every branch of this great seed house.

ROSE NOTES.

It would be difficult to imagine a better season for transplanting roses than was enjoyed during November. The plants were nicely ripened, growth in good condition, and free from the coarseness often found when a wet summer and autumn are experienced. Strong and coarsely grown plants are not so well suited for transplanting as those of medium growth and size. A large quantity of wood from the first-named is lost. The roots are correspondingly coarse, and there is little of the fibrous roots so essential to safe moving. Given a well-ripened plant, of medium strength, and with plenty of fibrous roots, early transplanting will secure good results the following summer. Coarse plants, on the other hand, spend the best part of their first season in recovering from severe mutilation of roots and wood.

The dry summer and autumn have made it easy to thoroughly cleanse and work ground intended for roses, and the present excellent condition of the soil, in almost all cases, makes it easy to plant roses firmly without trampling upon wet and cloggy ground. Condition of soil is not sufficiently studied. So long as it is fine overhead, too many are apt to push on with the planting, ignoring the fact that a wet soil never settles so kindly to the roots as when in a medium condition of moisture.

Firm planting also deserves more attention, more especially in the case of standards. Since it has become generally known how much better our dwarf roses thrive when planted deeper than was formerly the practice standards have also been planted more deeply. This is a mistake. The roots of standard brier stocks should not be placed deep enough to sustain the stock against wind and weather. If the collar of the brier is two to three inches below the surface, that is ample. Many a standard rose has proved a failure simply because it was planted too deeply. We plant dwarfs deeper, in order to get some of the rose growth below the surface, and thus induce better suckers and encourage the rose to strike out upon its own roots, and assist those of its foster stock. We cannot plant standards sufficiently deep to have any such effect. Besides, it is unnatural to bury the stems of briers in this way.

As soon as a few fairly sharp frosts arrive the question of protection is sure to come forward. While I not do believe in such close protection as many growers still practise, it is surely folly to leave our more tender varieties to full exposure. It is a good plan to have some material ready to hand, and that can be applied at once should severe weather set in. All dwarfs can be made secure at their base by drawing up the soil to them, even to the depth of nine or twelve inches. Several use litter, straw and bracken among the branches, but unless these are drawn together and the protective material secured we find it missing at the very time when most needed viz., during the prevalence of keen, frost-laden winds. Should the weather turn very mild again, this litter or straw has an injurious coddling effect. Twiggy branches of birch, fir, gorse, &c., will afford all the protection needed. These do not induce so much tender growth, are very easily fixed or removed, and, so long as the sharpest effects of the frost are broken, we need have little fear for the majority of roses, whether teas, hybrid teas, or hybrid perpetuals. Of course, there are a few notoriously tender varieties, and these must have more care and protection. I do not propose to name any of these, because the same variety differs so much in the various localities. Much depends upon the position. If high and dry, roses will often come safely through a trial that proved fatal to others in a low and sheltered spot, but close to a body of fresh water. It is the late spring frosts that are most injurious in the latter case. When ordering roses the purchaser almost invariably asks for strong plants. My choice would be those of medium size and strength, worked low in the case of dwarfs, and well up to the main stem when in standard form. So long as one has the proper or most suited varieties for a given purpose, a plant of medium strength will soon surpass those carrying a lot of wood when first received.

We have had a good number of really useful and distinct new roses during the past three seasons, and a brief note of a few of the best may be some guide to purchasers. I propose to note the twenty-five varieties that have proved the most promising from the introductions of 1896, 1897, and 1898. Antoine Rivoire is the result of crossing Lady Mary Fitzwilliam and Dr. Grill, two of our freest bloomers. The colour is a deep rosy flesh, with a tinge of soft copper. It is a good grower, with blooms of large size, full, and camellia-like in form. In Beauté Lyonnaise we have a grand seedling from Baroness Rothschild, presumably crossed with some tea or noisette, seeing the raisers describe it as a hybrid tea variety. A robust grower, with large and full flowers built up of immense petals; white, slightly tinted with lemon-yellow. Calocarpa is a rugosa of exceptional freedom, both in growth, flower, and berry. At present it is one of the most showy plants in the rose garden, and has immense trusses of deep crimson berries, remaining upon the plant long after the other rugosas are past. The foliage colours well; yellow, orange, purple, bronze, and deep crimson shades all being present. Carmine Pillar ranks among our best singles. It is by far the best carmine pillar rose we have, and exceptionally full of flower early in the summer, the blooms being from three to four inches across. Shoots of from ten to twelve feet long are produced, and almost every eye carries trusses of blossom the following season. Ellen Drew is simply a sport from Duchesse de Morny, but a clear silvery-pink ground colour and delicate peach shadings. Laurence Allen reminds one of Baroness Rothschild in growth and foliage, but the flower is very full, inclined to globular form, extra sweet-scented and lasting, and of a much clearer light pink. It is a grand show and pot rose. Muriel Grahame is a grand light blush sport from Catherine Mermet, and cannot be over-praised. Queen Mab gives us one of the most uniquely coloured of all the garden roses. It is a China, of fairly free growth, very full of blossoms that are rosy apricot shaded orange. Souvenir de Catherine Guillot deserves special mention. It is a free grower, constant bloomer, has deep coppery-bronze foliage, long buds of very deep orange-red colour, tinted with carmine. One of the best decorative roses we have, and very fragrant. Tom Wood is a hybrid perpetual that is both useful in the exhibition box and the garden. A vigorous grower, large and well-formed flower; one of the best to last, and a grand deep cherry red late in the season. The ten named above were introduced in 1896.

The following year we had, as the best of the introductions, Duchesse Marie of Ratibor, a cross between Kaiserin Augusta Victoria and Dr. Grill. As might have been expected, the growth is free and upright, while its free flowering qualities are among the best. The flowers last well when cut, are of good form, size, and substance, and borne very boldly after the manner of Kaiserin A. Victoria. The colour is clear creamy yellow, with a reddish yellow shade in the centre. Emanuel Geibel is presumably a sport from Madame Falcot, and resembles that old favourite, except in being larger and much deeper in colour; the improvement in these respects is most marked, and I am sure this variety will be good enough for the exhibition stand. Frau Geheimrat von Boch is a vigorous and bushy grower, and one which flowers from June until November. The petals are large and wide, buds very long, opening into a full and well-formed flower. In colour it is a clear creamy gold, and often has a distinct shade of carmine on the back of petals. Grande Duchesse Victoria Melita is a cross between Safrano and Caroline Testout. It is somewhat difficult to know how to classify a rose of this pedigree. Here we have a tea and a hybrid tea, crossed with each other, and the raiser calls the seedling a tea. Duchess Marie of Ratibor is also a cross between a tea and a hybrid tea, by the same raiser, and classed as a tea; but another variety, Antoine Rivoire, resulting from crossing these two classes, is placed among the hybrid teas. I mention this as a further proof that our roses are fast becoming so intermingled and crossed that we shall soon have to dispense with classes altogether. Even now we have them running into one another so much that our best authorities disagree as to which class or section many varieties belong. The seedling from Safrano and Caroline Testout is a grand rose and a strong grower. The buds are long, and always open into a large, well-formed flower. Like its parents, it is a very free and continuous bloomer; a creamy-white colour with a distinct shade of light gold in the centre. Merveille des Blanches is a sport from Baroness Rothschild, a pure white, with the exception of a faint tinge of pink when growing in full sunshine. Wasily Chludoff is a good climbing noisette with handsome, bronzy foliage; long, brilliant coppery-red buds, tinted with yellow, and very sweet.

In 1898 we have seven that are well deserving of notice. Beryl is the most highly scented of all teas. This is very free in growth and bloom, the buds long, and a deep golden-yellow shade found in no other rose. It is not very full, but a grand decorative variety. Grand Duc Ernest Ludwig is a cross between Général Jacqueminot and Maréchal Niel. In flower and growth it resembles the last, but has the colour of Maréchal Niel. Killarney is most pleasing in colour and form, flesh white, suffused with pale pink. L'Innocence much resembles Caroline Testout in habit and form, but is a pure white. This is one of the most promising roses we have. Purity fills a want among early-flowering pillar roses, and is a pure white of grand form, but medium in size. One of the earliest and freest bloomers we have, Souvenir de J. B. Guillot, gives another of the peculiarly shaded roses introduced recently. This is free in growth and bloom, and of fair size and substance. The colours vary between nasturtium-red, red shaded with crimson, and bright coppery-red. White Maman Cochet is merely an almost pure white sport from that well-known tea rose, and certain to be most useful. Violoniste Emilie Levegue is a grand grower, with large and well-formed flowers. The colour bright rosy carmine, with an orange centre, buds very long and pointed.

Among seasonable work we must not forget the mulch of well-decayed manure. Thoroughly rotten vegetable matter and manure that have been turned over a time or two makes an excellent mulch, and cannot be applied at a better time than the present, so long as the ground is not too wet to wheel upon. A plank or two will easily remedy this. Mulchings not only protect the base, but the nutrient properties are washed down to the roots steadily during the winter. Upon no account mulch newly-budded dwarf stocks. The rose bud is much safer left exposed. I do not pretend to say why such is the case, but experience has proved that when mulched the rose buds are often killed in large numbers, especially if strong manures are used. Yet we can safely cover the eyes at the base of established and recently moved plants.

A. PIPER

Chrysanthemum Mytchett White.—This is one of the best of the early-flowering varieties that have been introduced to our gardens in recent years, and one that in the near future will probably become very popular for planting out for producing cut bloom and for the embellishment of the garden. For cultivation in pots it is the best of the early flowering chrysanthemums that I have grown for this purpose, the plants being naturally of a dwarf, branching habit, producing good heads of bloom and sufficient foliage in quite small pots. The flowers are pearly-white, with broad and slightly reflexed florets, and, unlike some varieties, these appear to open and retain their purity whether grown under glass or in the open. Owing probably to over-propagation, the plants received last spring had a very weakly appearance; so much was this the case that I at first despaired of seeing them in bloom, but as the season advanced the weakness was overcome, and in the end the fine appearance and usefulness of the plants fully justified the high opinion expressed upon the variety when you gave a full-page illustration of it last year. With strong cuttings, and consequently better plants earlier in the season, it is anticipated that this variety will flower when planted in the open in August, and ultimately take the place of the small-flowered sorts that until now have been used for this purpose. Compared with Madame C. Desgrange, it has the advantage of being much dwarfer and of a more spreading habit of growth, which enables it to be planted in very exposed situations without the trouble of staking to keep the branches erect in boisterous weather.—JAMES DAY, *Galloway House, Garliestown, N.B.*

NEW CHRYSANTHEMUMS.

Yellow Japanese.

IN giving a list of new varieties this season there is such a wealth of material to deal with that it is more than usually difficult to make a limited selection which will not involve a considerable outlay, that is if we are to satisfy our desire to be thoroughly up-to-date. In fact, so many good varieties have emanated from our English raisers that one begins to foresee the time when we shall be able to purchase a packet of home-grown seed—"somebody's gold medal strain"—which will enable us to dispense with named varieties in the same way that we now do in the case of carnations, begonias, and gloxinias. It is more than probable that this is a feature of general cultivation which may take some time yet to realise, but it is possible that we may have good competitions in classes for own raised seedlings early in the next century, and with such displays a new interest will be awakened in the cultivation of chrysanthemums generally.

To deal with the present, however, is our business, rather than to dream of the future, and in looking over the list of notable varieties seen for the first time this season it is gratifying to be able to record a more promising increase in the number of richly coloured flowers. Least conspicuous are the whites, and of the few exhibited possibly none are better than the best already in cultivation, though they may improve on acquaintance and in a more suitable season.

R. Hooper Pearson is the finest yellow variety of the season. Of this Ryecroft seedling I grew two plants, and the habit of growth is all that can be desired; dwarf and sturdy, with stout flower stalks; it may be best compared to Mutual Friend. The flower also resembles this well-known white in general character and petal, but the colour is the most rich and deep golden yellow.

Soleil d'Octobre is very fine, and though its name implies that its season is early excellent blooms have been shown at the November exhibitions; the blooms may be described as resembling Phœbus, but have more substance and a deeper shade of yellow. It will probably prove a favourite amongst northern growers.

Mrs. Brewer is a variety of high quality, having broad petals, loosely incurving; the flower is large and rather early; will do well for October in the south, and should suit Scotch growers for November.

H. Rivers Langton is a lovely pale yellow sport from Mrs. W. H. Lees, and will probably be more admired than its parent; the late crown buds give blooms of a quite distinct shade of colour. This forms another instance of simultaneous "sporting," as in four cases the same sport appeared during the season of 1897.

R. J. Upton will probably prove a fine acquisition; the petals are long and tapering, flat, though occasionally twisted and drooping. The blooms were large and of good character, though grown on late struck plants. Colour rich canary yellow.

Le Grand Dragon is a huge spreading flower, of a brilliant shade of yellow, somewhat flat in build, but distinct and promising.

Mons. Fatzer is another of the large ones, which has not been shown in its best condition; it is a pale yellow, and something of the build of Madame Gustave Henry.

Nina Dabbs, though not a graceful type of flower is a bold and striking bloom when well grown. The petals are very broad and flat, the centre ones erect and forming a large flower of a deep yellow colour. This was well shown by Mr. Vallis at Devizes.

Lord Aldenham is a yellow sport from the well-known Edwin Molyneux; the growth and style of bloom consequently are the same as in that variety. It should become a favourite with exhibitors, and though it has not been submitted to the Floral Committee, I believe it will be distributed this season.

Dakota is one which will prove a fine October variety, and may also be had for the November shows. On early buds it is a fine flower of the best type, the petals drooping and intermingling in a charming manner; later crowns give incurving flowers. It is a good yellow.

Crimson and Red Varieties.

Passing to the deep colours of crimson or red shades, which are so scarce amongst the large flowered types, there are several which may be strongly recommended.

H. J. Jones should please the most fastidious as to colour; it is a seedling of Mr. Seward's, and one of the best crimsons yet raised. The petals are flat and spreading, the whole of the upper surface being presented to view, thus giving a much better effect than those which incurve and hide more or less of their best colour.

Reginald Godfrey was well shown on October 11, and it is a reddish crimson-coloured flower with long petals spreading and drooping, something in the way of John Neville, but strikes one as being more easily grown.

John Pockett is an Australian variety of semi-incurved character; a good number of petals turn back and show the deep crimson colour; the reverse side is a bronzy red, which is more attractive than with most of this type. It is a good grower, about five feet high.

Pride of Stokel, the sport from Pride of Madford, is a welcome addition in colour; unfortunately, like its parent, the majority of the petals incurve, and so hide too much of the beauty of the flower. It is a crimson shade, and well worth growing.

Henry Weeks.—This is a grand flower, comparable to a giant G. C. Schwabe, and probably the finest of the new ones in this tone of colour. It has size and refinement, with a bright reddish crimson shade, which is sure to be appreciated.

Mrs. W. Seward has exceedingly rich colour, and reminds one in its build and style of Chenon de Leche. The florets are broader and of more substance, and form a very neat and attractive flower of large size. The colour is bright rosy cerise, with golden tips to the petals.

Eastman Belle is a purplish crimson sport from President Borel; in other respects has doubtless the characteristics of that variety.

Lord Cromer has everything in colour to recommend it, being of a rich bright crimson. The blooms impressed one as being capable of better development, and if so it will prove a decided acquisition.

White Varieties.

It happens this year that the finest white variety amongst novelties was reserved for the closing meeting of the Floral Committee of the N.C.S., and was shown at the society's show on December 6. It is a cross between Mrs. H. Weeks and Madame Carnot, and will probably prove superior to both these fine varieties. The raiser of so many splendid seedlings, Mr. H. Weeks, of Derby, has added this one to his list of triumphs, for it was unanimously awarded a first-class certificate. It will bear the name of *Madame R. Cadbury*, though it may possibly be reserved for distribution in the spring of 1900. The flower is of the largest size and true Japanese character, partaking of the habit of both its parents in the broad florets, which droop and intermingle in a charming manner. There is something inexpressibly satisfying in the beauty of this flower. The fine substance of the florets and chaste colour will commend it to everyone.

Little Nell is another good white raised by Mr. Weeks, which promises to become a popular exhibition variety. It may be compared to Madame Philip Rivoire in build, but the petals are broader and the bloom larger.

Nellie Pockett is an Australian seedling which has been shown in many places during the past season. The colour is creamy white, the petals narrow and curling at the tips.

Jane Molyneux was shown by Mr. Nat. Molyneux, of Fareham. The blooms were large, with long, drooping florets; creamy white.

Lady E. Clarke is a white sport from the well-known Mrs. C. Harman Payne, and is synonymous with M. Louis Rémy. The parent variety sported in both France and England during the same season, and hence the two names, of which the English should obtain.

Miss M. Leschelles is a very pure white sport from Reine d'Angleterre, and those who grow the last named will probably like the white variety.

Mrs. Ritson is another sport from the beautiful though capricious Viviand Morel. There appears to be no doubt of its being properly fixed, as small blooms grown on bush plants from terminal buds were quite white.

Annie Prevost is a beautiful glistening, pearly white, incurving after the manner of Western King. The dwarf, sturdy habit of the plant will commend it for a variety of purposes.

Rose, Mauve, and Other Varieties.

Passing to others of various shades of colour, there are quite a number of first-class sorts.

Mrs. Barkley is a very fine flower, of splendid form and build. The broad petals are flat, and recurving closely they finish a large solid bloom, which will surely be popular with exhibitors. The colour is bright rosy-purple.

Madeline Davis, though not one of the very largest size, is a refined and pretty flower of best qualities; crisp and fresh in texture, it is a good keeper, and of capital habit in growth. The lower petals are broad and drooping, centre ones spirally twisted, in colour a delicate tint of rose with a suffusion of violet.

Mrs. Coombes is an immense flower, with a mass of narrow, drooping petals, rosy-mauve in colour; one of the giants of the season, and a fine show bloom.

Sir Herbert Kitchener.—This name, so popular just now, is given to one of a charming colour—apricot yellow with a bright flush of bronze pervading the flower. The florets are broad, long, and drooping; a very pretty Japanese.

Emily Towers is a charming type of bloom, the colour bright rosy-pink, with silvery reverse, crisp and solid in build; the petals curl and finish a fine flower.

Miss Lullah Miranda is another from Australia of high promise which should be added to every collection. It bears a first-rate reputation, and from small plants has given flowers that fully support this.

Lady Crawshaw is a large white, tinted pink, with curling and interlacing florets; well worth growing for specimen blooms.

Mr. Hugh Crawford has a lovely bright golden colour, shaded bronze, petals broad and curling; a variety of much promise.

Lord Ludlow, in colour a chamois-yellow, edged and slightly shaded crimson; should prove an acquisition.

Chatsworth is a vigorous grower, and withal a capital show flower. The petals have a pretty curling habit, and are more or less tinted pink.

Edith Dashwood forms a large flower of long, narrow, twisted florets, pale pink in colour, and a very distinct variety.

Mrs. White Popham in some stages resembles Graphic, but as seen at its best is better in character than that variety, pale in colour; a large flower.

Samuel C. Probyn is a very distinct variety, a novel mixture of colours in crimson and yellow. The plant is very robust and dwarf in growth. This is quite out of the common.

General Paquié is rather a thin flower, and was somewhat disappointing. The florets are long, flat, and semi-drooping, of a light chestnut colour.

Lady Phillips.—As shown it was large, the petals broad, and loosely interlaced; deep mauve in colour.

W. Cursham.—A large and distinct incurved Japanese of a buff colour. In build it compares to Madame Rozain.

Mrs. W. Cursham was shown in fine condition, and undoubtedly is one well worth growing. It has a bold bloom, broad intermingling and curling petals; deep pink, shading paler towards the centre.

Trent Park Gardens. W. H. LEES.

Monsieur Ernest Fierens.

Of all the Ghent celebrities well known to English horticulturists there are few whose names are more familiar than that of the genial and courteous Secretary of the Royal Agricultural and Botanical Society of that city. For many years past he has been an active and enthusiastic amateur of gardening, and when, some eight or nine years ago, the secretaryship of that society became vacant Mr. Fierens was elected to fill the place.

How well the selection was justified is best judged by those of our friends and readers who visited the last two Quinquennial Shows, and by those who attended the last Chrysanthemum Show held under the auspices of the Ghent Society, where he staged a magnificent group of flowering chrysanthemum plants in pots, and other very meritorious exhibits; indeed, in regard to the popular autumn flower, Mr. Fierens is not only a grower of importance, but a successful raiser, for having received seed from Japan he succeeded in obtaining some new varieties, of which one called Afsné, a large white Japanese, was figured in the *Revue de l'Horticulture Belge* not long since.

Monsieur Ernest Fierens.

Mr. Fierens, like many other distinguished lovers of horticulture, has no business interests in the subject, for he happens to be a member of the legal profession, and yet finds time to devote a large amount of attention to his secretarial duties, which in the case of a society like the one at Ghent is certainly no sinecure.

His services to horticulture are, however, well known far beyond the narrow confines of King Leopold's busy little kingdom, and fully appreciated, in confirmation of which we may say that we have just learnt with pleasure that the French Government has recently conferred upon him the cross of the Order of the Mérit Agricole, a decoration which was also only a few months ago bestowed upon his eminent colleague, Mr. Pynaert van Geert. When we consider some of the recent appointments—notably those of our friends Mr. Fatzer, a Swiss, and Mr. Herman Payne, an Englishman—we cannot help but feeling that the French Government takes a very broad and generous view in recompensing foreign workers in the various branches of horticultural work.

We therefore offer our heartiest congratulations to Mr. Fierens on the well-earned honorary distinction with which the French Government has recognised his many valuable services.

FRUITS FOR COTTAGERS AND SMALL FARMERS.

I am rather surprised to see that your able and fair-minded correspondent, Mr. Molyneux, describes Sturmer Pippin as "quite third rate." The late Dr. Hogg's opinion ("Fruit Manual") was as follows: "This is one of the most valuable dessert apples of its season; it is of first-rate excellence, and exceedingly desirable, both on account of its delicious flavour and arriving at perfection at a period when the other favourite varieties are past. It is not fit for use till the Ribston Pippin is nearly gone, and continues long after the Nonpareil. The period of its perfection may be fixed from February to June." And this is Mr. Barron's ("British Apples"): "D. Small, flat, green, russet bronzed, firm, sweet, late, first quality; a free cropper." Their opinion coincided with that of the forty experts who were responsible for the first and second editions. I suspect Mr. Molyneux tries it too soon, or gathers it too early. This year it would hardly come away from the tree until the middle of November. But I quite agree with him that Gascoyne's Scarlet is inferior as a dessert apple. It is one of the new sorts placed in the list apparently before it has been fully tried and approved.

An Old Stager.

Mr. A. Dean, in his remarks under this heading, says that "No human being could give a list of the best half dozen apples for every soil, situation, or district in the kingdom." If Mr. Dean will turn to pages 85, 86, and 87 of the Prize Essay of the Fruiterers' Company on Fruit Growing he will find that the attempt has been made, and, at all events, with some success.

F. R. H. S.

Messrs. James Carter and Co.'s Prizes.—During the past year Messrs. James Carter and Co. originated a new system of competition with the produce of their vegetable and flower seeds which has proved eminently successful. They offered to duplicate at one hundred and three horticultural exhibitions in various parts of the country every prize won by their customers in the open classes, and as the result of this offer it has been found that one thousand three hundred and nineteen prizes were awarded to the produce of their seeds.

Leaves From A Rambler's Note-Book

A PEEP AT ALTON TOWERS.

Everybody takes a holiday nowadays, and the problem that is most perplexing is—how to spend it. We live at higher pressure than our forefathers did, and there are but few who treat the time of respite from labour as a period for rest and leisure. On the other hand, the one idea seems to be that of seeing as much as possible or obtaining the maximum amount of pleasure during our weeks of holiday, with the result that we often commence work again as jaded in body as when we left off. It is hardly to be wondered at, considering the baits held out to us to see other lands and other peoples by the aid of railways, steamboats, and personally conducted tours. This is all very well, but unfortunately, in their anxiety to see the beauties of other lands, people are apt to forget that our own island contains scenery equally as beautiful, places quite as interesting, and spots just as romantic as any abroad, and when one who is satisfied to thoroughly "do" his own country before going elsewhere tells of what he has seen within a day or two's journey from his own home his neighbour, just returned from satisfying his aspiration to see the world, is surprised that there are such sights in commonplace England. Gardeners as a rule are not great travellers, nor are they blessed with a superabundance of holidays. Neither do gardeners worry long as to the way in which the days of respite shall be spent. Take one of the fraternity and place him where you will with a full order to go where he likes. If he is true to the craft his first inquiry will be whether there is a garden of any note in the neighbourhood, and his first journey will be to visit it. It was this spirit that led me in the holiday season to visit Alton Towers.

There are certain establishments that are famous for some reason or other, and consequently they become household words among gardeners. Alton Towers, the seat of the Earl of Shrewsbury and Talbot, is one of these, and the one thing that makes it so is the unique beauty of its garden. The place has no ancient history to speak of, as a century ago the present domain was unknown. The garden can boast of no great record in the production of sensational specimens of horticulture; its area of glass, though extensive, is not stupendous, and its facilities for high-class cultivation are hardly equal to many establishments less famous. Its charms and its fame lie in the fact that years ago there was a rough, wild, uncultivated spot that was suitably adapted for the formation of a garden. A nobleman, who was also a genius and a gardener, saw it, and at once brought the force of his superior ability to play upon it; wealth and the art of a born landscape gardener added their share, Nature coupled hers, and the combined forces changed a rough, wild valley into the beautiful garden that has made Alton Towers famous. The first pleasing phase about the place is the total absence of anything that is monotonous and tiring. With a groundwork admirably adapted for the formation of curves, there is hardly a straight line to be seen. It is a notable instance of art improving Nature, and rocks, wood, and water have all been utilised to the best advantage. Situated within easy distance from the Staffordshire potteries, and within touch of the large manufacturing towns of Lancashire, it is no wonder that crowds of people flock to see the charming garden, which is open to the public during the season, and few there are who return in any way disappointed. Alton Towers is not a place requiring a gardener to appreciate it. Anyone can do it who has half an eye for the beauties of Nature.

The Churnett Valley, extending from the moorland town of Leek to the point where the above river empties itself into the Dove, is a charming bit of scenery. The meandering river winds its way down the valley, on either side of which are romantic bits of landscape composed of wooded slopes, bold rocks, ravines breaking away in either direction, stretches of bracken with openings here and there showing views of the country beyond. The railway runs by the course of the river, and, as it has never been considered necessary to run express trains in that part of the world, travellers have ample opportunity of enjoying the surroundings as they proceed. Everyone nowadays likes to go quickly, and in the ordinary course of things the writer is no exception; but then I was holiday making, and one can afford to appreciate a stopping train along the Churnett Valley. It is a mistake for anyone to imagine that they are at the Towers when they alight at Alton Station. Far from it; for there is a genuine Staffordshire hill to climb as soon as you have passed through the doors of the entrance lodge. The most natural inspiration before commencing this operation is to stand and look across the valley, where stands right on the edge of a sheer precipice a fine structure, known as Alton Castle. It occupies the site of the ancient castle, destroyed during the civil wars, which from its position one would think was well-nigh impregnable. However, like many others, it had to go, and a noble building, erected by a former Earl of Shrewsbury, stands in its place. It is built of the hard sandstone for which the neighbourhood is famous, and commands a grand view of the valley below. Alton Towers stands on the crest of the hill opposite, but is hidden from the valley by the wealth of timber that clothes the hillside. But thither we were bound, and with a last look at the valley commenced the climb.

In front of us was a stout lady, who, from the tone of her conversation, apparently came from Lancashire, and with her was a small wiry man, presumably her husband. The latter inquired the nearest way to the Towers, and received the answer, "The step walk is the nearest, but the carriage drive is the easiest." Human to the backbone, he chose the nearest, and lived, I fancy, to repent, for the way is a series of flights of steep steps in close succession, and not exactly the road to be chosen by anyone carrying a superfluous amount of flesh. Whilst we lingered viewing the scenery the two made headway, and by the time we had got up about half the flights of steps we passed the lady in question seated on a large stone mopping her face with her handkerchief and refusing to go another yard. Her husband, some distance ahead, was expostulating with her, and offering some pointed remarks respecting the stupidity of women. The lady, however, held her own, and retaliated by charging him with doing it on purpose. We offered consolation by remarking that it would be easier coming down, but it was only received with a sharp rebuff, and we did what is best to do when family happiness is at stake—left them to settle it. Alton Towers is a name aptly applied, as the visitor finds on reaching the mansion. It is a fine pile, containing different types of architecture, and covering a large area of ground. At one point it resembles a grim Norman stronghold, and at another there is the graceful elegance of a more modern style. Great towers rise at every point, some square and forbidding, others highly decorated and elegant in form. The outline is everywhere broken and undulating; every stone is set in a workmanlike manner; decoration on all sides shows that no expense was spared in erection, and the general attractiveness of the building proves that the architectural skill was of the best. With these remarks, all too brief to do justice, I leave the Towers and pass on to the famous gardens.

The main entrance to the gardens is through large iron gates, over which a bridge conducts a roadway. It was on this bridge we paused—as ninety-nine out of every hundred visitors would naturally do—for before us lay the valley, which, for a happy blending of Nature's beauty and man's genius, has probably no superior. Right in front, under a covered canopy, stands the bust of a man with classic features and a massive brow. Underneath runs the following inscription: "He made the desert smile;" and, simple though the words are, they have a deep meaning. There stands the effigy of a great gardener, and round him is his handiwork. He needs no biography or memoirs to tell of his life work, for it is there all round him. The noble Earl transformed that rude valley into a place of beauty, and it is only in keeping that his monument should stand in the midst of his work. That man must have been happy, possessed as he was with a genius, and also the facilities for bringing his powers into play. His memory will live while the gardens exist. Along one side of the valley are sloping banks, and walks winding in and out among huge clumps of rhododendrons; hemlock spruce, cedars and yews are dotted about, and here and there copper beech and bright-coloured acers form a relief to the surrounding green. Thick timber forms a pleasing background, and nestling, as it were, in a canopy of foliage, stands the Harper's Cottage. This is a thatched structure built in Swiss style, and quite in keeping with the surroundings. Leading to the depths of the valley, a cascade of water dashes from rock to rock through bowers of foliage, forms itself into a pool at the bottom, and then on again to yet another pool from the centre of which rises an elegant iron fountain built in pagoda style. This is fed naturally from a lake above, and throws up a jet of water to a great height. On again goes the stream that overflows from the lower pool till it loses itself in the river away down the valley.

On the other side of the valley there is more of the artificial, and terraces take the place of sloping banks. These rise one above another from the depth of the ravine, and along the edges stand vases furnished with flowers. Occupying a position on an eminence beyond is the Temple, an elegant ornamental structure, having three balconies, from which is obtained a fine view of the gardens and the towers beyond. Alongside the sloping walk leading from the entrance gates is a long flower border running parallel to a handsome scolloped walk which forms the boundary on one side. This part of the garden was gay with dahlias and other flowers. On the long border was a unique pattern of bedding, and the well-kept appearance is evidence that all is in the care of a master hand. Conspicuous from the bridge where we took our stand is a handsome range of conservatories, with dome-shaped roofs and ornamental fronts. From an architect's point of view they are superb, but a gardener would prefer something of a more useful type. It would be difficult to imagine a more pleasing picture than the one I have attempted to portray. Nature provided the groundwork, and the architect and landscape gardener have done the rest. Many styles of gardening are introduced to advantage. Here is a bit of Dutch, there a bit of Italian, and yonder again a handsome piece of skeleton stonework on which stand the figures of the Muses. The work of the sculptor is apparent in the statuary, and water has been largely used in making a general effect. We stood in admiration of the scene before us, lulled by the music of the rippling waters, when the voice of the gate attendant below inquired whether we wished to enter the gardens.

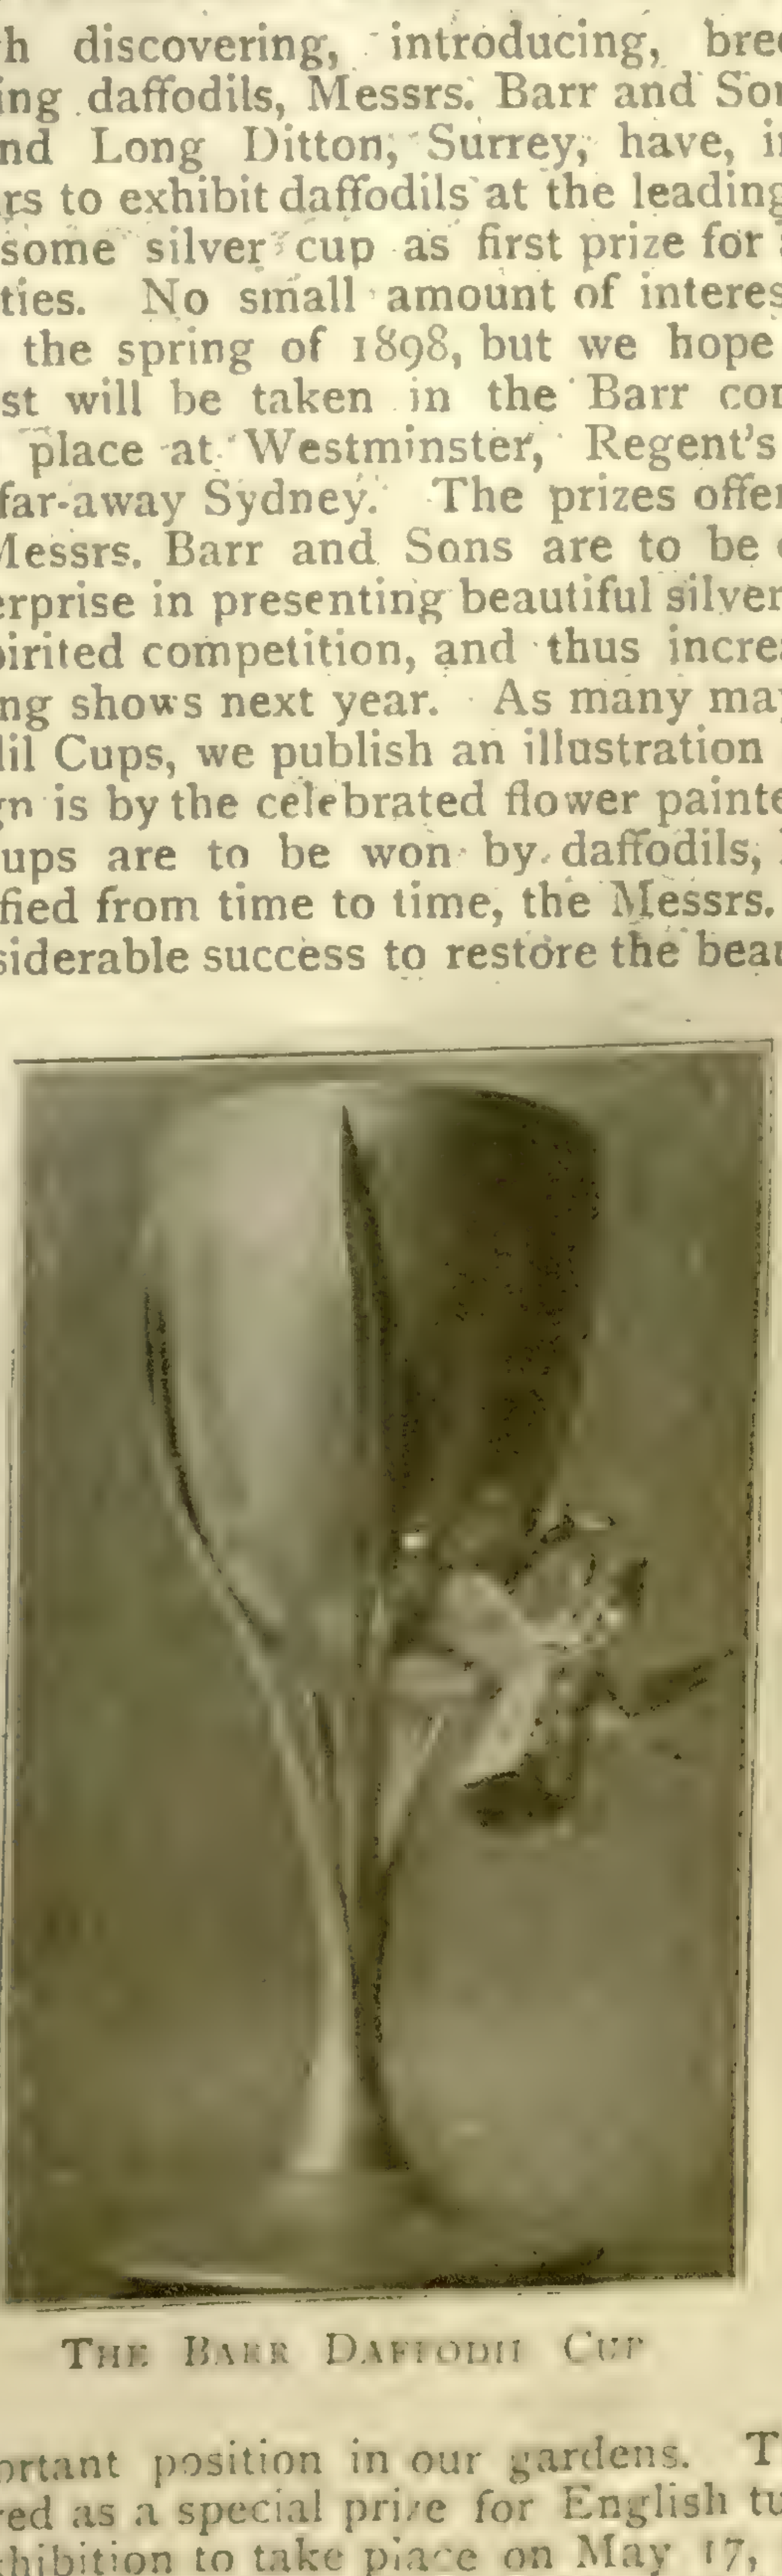
Of course we wished to enter the gardens, and could we see Mr. Gilman, who has sole charge of the domain? "Yes, certainly," was the ready reply, and very soon we were shaking hands with the genial chief. Mr. Gilman has a high reputation as a gardener, and for many years prior to taking charge at Alton he ably managed the gardens at Ingestre Hall, another of the Earl of Shrewsbury's homes. It was there he made his *début* as a grower and exhibitor of fruit and chrysanthemums, and also as the raiser of several fine melons and tomatos. At the death of the late Mr. T. H. Rabone Mr. Gilman was appointed to take charge at Alton Towers, and he has acquitted himself as ably as at Ingestre. He is full of schemes for fresh improvements, and has already done much, by the judicious cutting of over-luxuriant growth, to open out new views and make clear the original outline of the landscape. A walk round with Mr. Gilman proves that his ability is equal to his energy, as under glass or out of doors there are signs of cleanliness and good culture. Alton Towers is not by any means a convenient establishment for a gardener, as the houses are very much scattered. These difficulties, however, are made light of, and everything is managed as they must be in a garden, if matters are to be successful, that is, on a proper system. Mr. Gilman is a modest man, and it was not till after we had admired a superb house of tomatos for some time that he remarked that they were of a variety of his own raising, viz., Royal Chester. The fruits are medium in size, rich in colour, and the plants crop freely. The fruit also is extremely fleshy, and a variety possessing all these attributes is well worthy of a trial. It would be wearisome to the readers of the GARDENERS' MAGAZINE to attempt to drag them from house to house, through kitchen garden, flower garden, and pleasure ground, yet the walk with such an enthusiast as the gardener at Alton Towers was full of interest and incident.

Bedding is a big order in these extensive gardens, as, in addition to catering for the tastes of the Earl and Countess of Shrewsbury, there is a critical public to be considered. Well-known flowers, such as calceolarias, pelargoniums, violas, pentstemons, and so forth, are relied on, and many clumps of cactus dahlias show to great advantage. In the private garden immediately surrounding the mansion, and where the public is not admitted, there is the same good order, and from the terrace wall one obtains a fine view of the surroundings and the picturesque country beyond. Not the least interesting feature of Alton Towers are the miles of woodland walks and drives leading from the homestead. These divert and intersect in a way quite their own, passing along timbered slopes, under overhanging rocks, through shady dells, and leading—well, nobody but a born native of Alton could tell you where. All these highways and byways must be kept clear and in order, and add largely to the labour of the gardener. But miles were traversed in visiting scenes which any gardener would appreciate, and in collecting matter for these scrappy notes. The September day was hot, and though the big-framed gardener strode along apparently tireless other legs began to betray signs of fatigue. We arrived quite unawares by a true Alton walk, twisting and meandering, at a charming ivy-covered cottage with a tasteful garden in front, and having a view that many a millionaire would envy. "Come in and have some lunch" were words that seemed to fall naturally from the lips of our guide, and, as one would naturally and mentally suppose, there would be an introduction to Mrs. G. But, no! let it be told in a whisper—Mr. Gilman is a bachelor; yet one need not be long in his comfortable home before being assured that his personal comforts are safe in the hands of his able housekeeper.

H.

THE BARR DAFFODIL CUP.

NOT satisfied with discovering, introducing, breeding, cultivating, exhibiting, and selling daffodils, Messrs. Barr and Sons, of King Street, Covent Garden, and Long Ditton, Surrey, have, in addition, of late encouraged amateurs to exhibit daffodils at the leading spring exhibitions by offering a handsome silver cup as first prize for a collection of properly named varieties. No small amount of interest attached to this competition during the spring of 1898, but we hope and believe that a much wider interest will be taken in the Barr competitions of 1899, which are to take place at Westminster, Regent's Park, Edinburgh, Birmingham, and far-away Sydney. The prizes offered are well worth the winning, and Messrs. Barr and Sons are to be congratulated upon their taste and enterprise in presenting beautiful silver cups, which cannot fail to excite a spirited competition, and thus increase the extent and interest of the spring shows next year. As many may not have seen one of the Barr Daffodil Cups, we publish an illustration of one, adding that the charming design is by the celebrated flower painter, Mr. H. G. Moon. Not all the five cups are to be won by daffodils, however, for, as our columns have testified from time to time, the Messrs. Barr have laboured long and with considerable success to restore the beautiful English tulips to their former important position in our gardens. Thus we find that one cup will be offered as a special prize for English tulips at the Royal Botanic Society's Exhibition to take place on May 17, 1899, at Regent's Park. The other four competitions will be held, on dates to be presently published, under the auspices of the Royal Horticultural Society, Royal Caledonian Horticultural Society, Midland Daffodil Society, and the New South Wales Horticultural Society. Full particulars of the competition may be obtained upon application to Messrs. Barr and Sons, 12 and 13, King Street, Covent Garden, London.



THE BARR DAFFODIL CUP

CHRYSANTHEMUM GOLDEN SHOWER.

AMONG the many quaint and curious forms of chrysanthemums that have from time to time been exhibited probably no two have been more commented upon, or become known to so large a number of enthusiasts in so short a space of time, as those Mr. Witty, of Nunhead Cemetery, has of late brought into notice. These two varieties, Golden Shower and What Ho ! are wonderfully distinct from anything hitherto grown, although the former is akin to some of the spidery forms, and also appears to be a relative of the pretty decorative variety Alice Carter. What Ho ! reminds one of the Japanese introduction of some years back, and named Spiderkry ; it is both quaint and curious, but its best friend will scarcely allow that it is beautiful. Its florets are comparatively few in number, and form one ring ; each is stout, tubular, and three to five inches in length ; drooping, and with the end coiled up like a watch-spring. The colour is a pale yellowish shade. No doubt anyone who is bold enough to grow this variety and produce a really good specimen would create quite a sensation. At many a country establishment a specimen of What Ho ! would help to entertain and amuse the autumn shooting party, and by force of contrast with the exhibition Japanese and incurved varieties could be used to show the wonderful diversity of form the chrysanthemum is capable of. Not many have had a kindly word for What Ho ! and yet at the annual dinner of the N.C.S. the other night blooms of it were adorning many a manly breast. One authority has called it "a chrysanthemum gone mad," and another characterised it as "a botanical curiosity." Dame Nature surely smiled when she heard these remarks, and thought of the wild chrysanthemums of far Cathay.

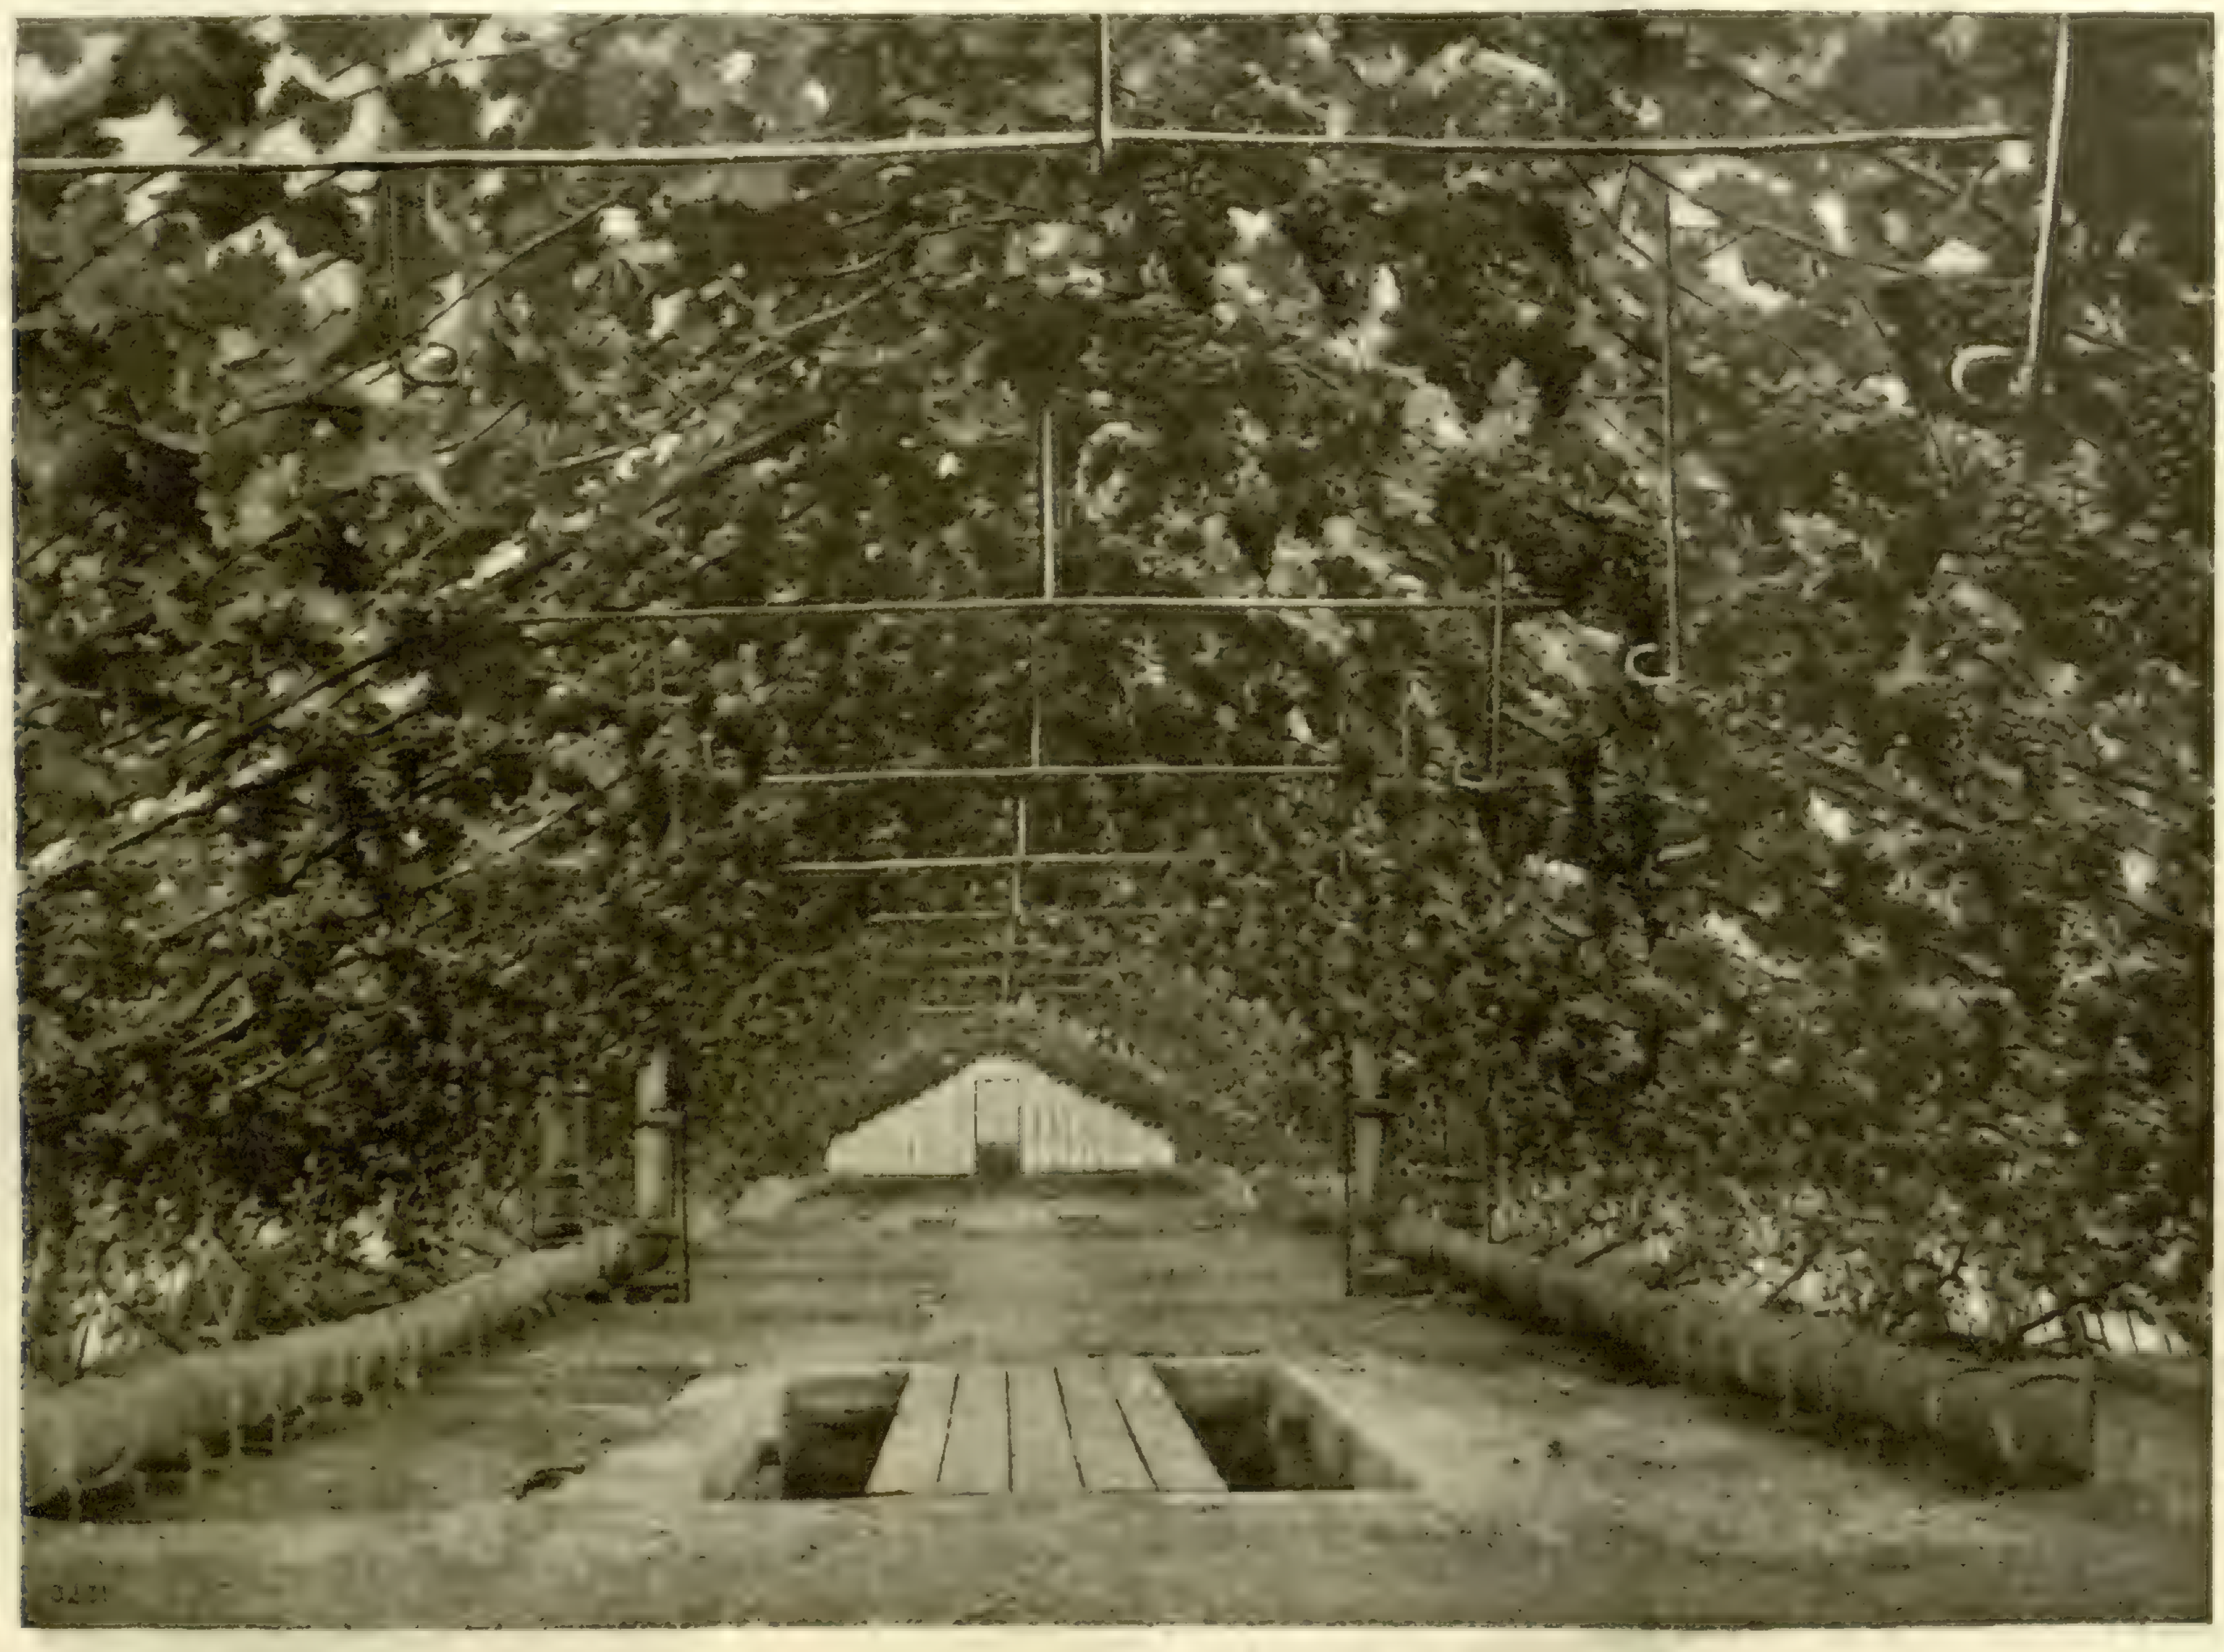
The other of Mr. Witty's novelties, Golden Shower, is figured in the present issue. To the writer's mind it is an extremely beautiful flower, and one well worth cultivating for cutting, provided it is at all free in producing blooms. So far it has not proved a particularly elegant grower, and as a decorative plant the variety has yet to be tested ; but those who saw the numerous blooms that adorned the tables at the Holborn Restaurant on the 30th ult. will readily admit that they were wonderfully decorative, and that there is room for this variety that so quaintly combines in itself the curious and beautiful. The illustration serves to show the form and size of the blooms, and how the long, drooping, thread-like florets have suggested the name of the variety. These florets are rich and deep golden yellow, this colour shading off to bright chestnut and a brilliant shade of crimson-scarlet. "Like spun silk," was the description given this variety by a lady at a recent Drill Hall gathering. Although shown at two meetings of the National Chrysanthemum Society, Golden Shower failed to gain an award from that body ; it gained an award of merit, however, from the Royal Horticultural Society, and this, rather than showing any weakness on the part of the Floral Committee, indicates the broad sympathies of that body, and reminds us that there are other beautiful flowers besides those that pass muster as exhibition varieties.

K. P.

A FRENCH FRUIT-GROWING ESTABLISHMENT.

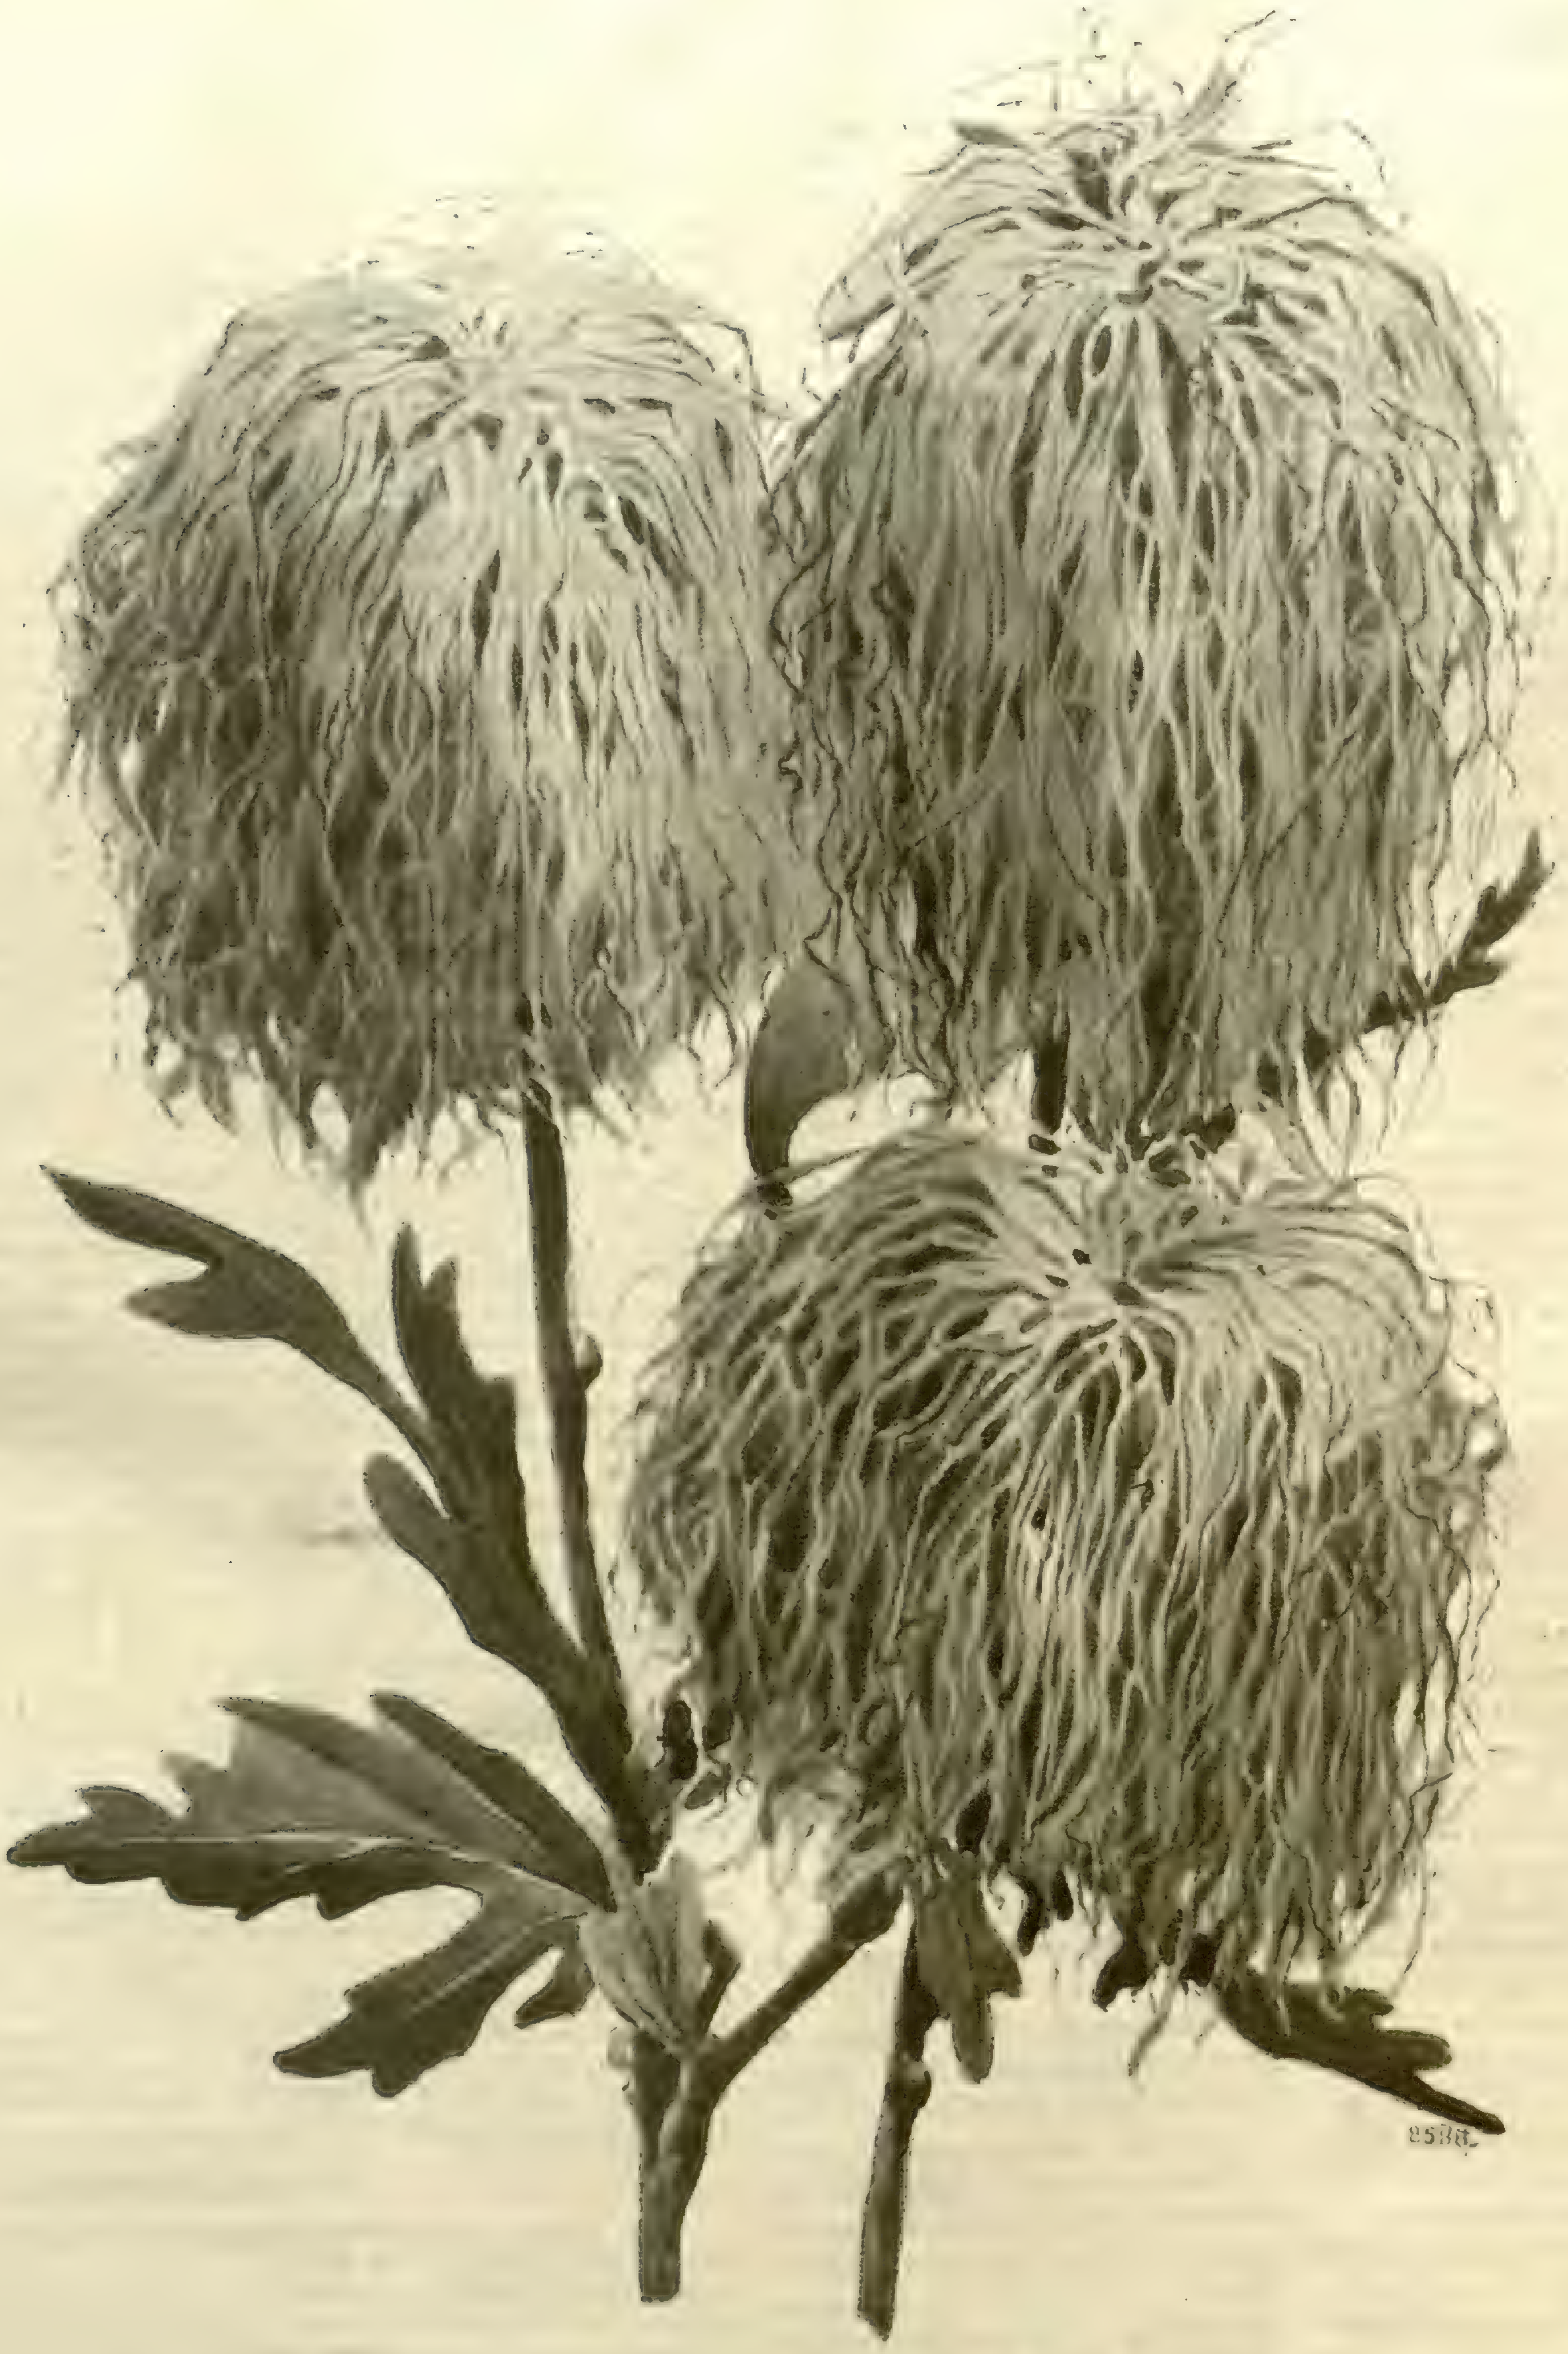
ENGLISH visitors to the exhibition of chrysanthemums held in Paris last month, under the auspices of the National Horticultural Society of France, were so surprised by the magnificent grapes exhibited by M. Fatzer that a few particulars of the establishment at Quessy, which he conducts with so much success, can hardly fail to be of general interest. The French cultivators of fruit who visited the exhibition were not less surprised by the remarkable examples of grape culture presented by M. Fatzer than were our compatriots, for, notwithstanding the success achieved by French cultivators in various directions, such superbly developed clusters of grapes are seldom, if ever, seen at competitive gatherings in France, and consequently the gold medal was awarded by the jury with acclamation.

The Quessy establishment has an area of about sixteen acres, and is chiefly devoted to the production of grapes, peaches, and nectarines for the supply of the principal establishments in Paris, the culture of grapes greatly predominating. The glass structures devoted to the fruits mentioned cover an area of four acres, and are for the most part heated by the old-fashioned flue, the method of heating being of special interest in view of the remarkable results obtained. The vineries are two hundred feet in length, and, with the exception of those from which the earliest crop is obtained, are twenty-four feet wide and ten feet high. The earliest houses are only six feet wide, and are heated by hot water. The illustration of one of the vineries devoted to the Black Hamburgh, from a photograph taken in July last, conveys a good idea of the general character of the houses devoted to the mid-season and late grapes, and also of the great excellence of the crops obtained. A large number of the bunches of the Black Hamburgh weighed from three to four pounds each, whilst none were under one pound, and the heaviest bunch turned the scale at six pounds, the colour and finish being throughout exceptionally good. The structure in question and all the mid-season and late houses are heated by flues constructed with pipes, as so clearly shown in the accompanying illustration, and six fires are provided for each house, and at certain periods of the year one hundred and four fires are going simultaneously. As M. Fatzer pointed out in conducting us through the establishment, the system of heating that obtains is troublesome and expensive, and also attended with some risk. Moreover, it is impossible to regulate the temperature of houses heated by flues with the same degree of nicety as with a properly fitted hot-water apparatus, and it is necessary to keep a sharp look out for accidents, such as the bursting of a pipe. Should this occur, and the sulphurous fumes escape into the house even for a short time, the whole crop may be ruined.



VINERY PLANTED WITH THE BLACK HAMBURGH GRAPE AT QUESSY.

The Black Hamburgh is extensively grown for the early and mid-season supplies, as also are Foster's Seedling and Buckland Sweetwater, all of which are much appreciated in Paris when of the high quality characteristic of the Quessy grapes. Canon Hall Muscat is also grown with much success for cutting in June, the size of bunch and berry and



DECORATIVE CHRYSANTHEMUM GOLDEN - SHOWER.

the colour being remarkable for a crop attaining maturity at so early a period. The varieties grown for sending to Paris during the autumn and winter months are Gros Colmar, Alicante, and Muscat of Alexandria, and of these heavy crops of the highest possible quality are obtained. Finer examples of Gros Colmar than those contributed by M. Fatzer to the Paris Exhibition in November have not been presented to public notice, and the superbly-finished clusters fully justified the interest they created amongst the visitors. Still more remarkable was the crop in the vinery from which the exhibition bunches had been cut. From within a few feet of the base to the top the vines were furnished with bunches of large size and finely coloured. The heaviest bunch weighed six and a-half pounds, whilst the larger proportion ranged from two to four pounds. The weight of bunch this season is hardly equal to that of last year, when the heaviest bunch weighed nine and a-quarter pounds, but for size of berry, colour, and density of bloom this year's crop is decidedly superior. Alicante and Muscat of Alexandria give equally satisfactory results, and we were much impressed by the heavy and finely finished crops of these two popular grapes.

Peaches and nectarines have considerable space devoted to them, and the starting of the several houses is so arranged as to ensure a continuous succession from early in April until about the middle of July. The varieties of these two kinds are such as would be selected by experienced cultivators on this side of the Channel, and include the most recent of the introductions as well as those which have been long in cultivation. Early Rivers nectarine occupies a prominent position and is regarded with much favour by M. Fatzer, who on reading our description of it when first introduced to public notice at once recognised its adaptability for commercial culture, and obtained trees immediately the variety was introduced. It has fully justified the opinion we expressed of its merits, and the trees have consequently been multiplied to meet the demand for large finely-flavoured nectarines early in the season. In addition to the cultivation of the fruits mentioned considerable numbers of chrysanthemums are annually grown for the production of large blooms of high quality. The Parisian florists demand blooms of exhibition quality with long stems, and M. Fatzer very properly provides what is required.

We were not a little interested in the details of management. The establishment, as stated above, has an area of sixteen acres, of which four acres are covered with glass, and yet the staff employed by M. Fatzer consists of eight men only. No regular hours are kept, nor are any additional hands taken on, when there is an exceptional pressure of work, as, for example, during grape thinning. During the busy times everyone does his best, and when the work is not pressing the staff takes things a little easier, and the men evidently like this course of procedure, for they have all been employed in the establishment upwards of ten years. M. Fatzer, who has recently had the distinction of the Order of Mérit Agricole conferred upon him, takes his full share of the work, as evidenced by the fact that with the assistance of one man he gathers and packs all the fruits and flowers grown in the establishment. It may be of interest to add that the water used, and the quantity must be very large, is raised by an aerometer or wind pump from a well to an immense tank on a tower, and from this it flows to the houses, as by this means a considerable saving of labour is effected.

GREVILLEA ROBUSTA.

This elegant greenhouse shrub is well worthy of a place in all collections of plants, in fact should be included in small as well as large collections, for whether used as a table plant, for room decoration, or as a sub-tropical subject for the flower garden it is not surpassed by anything in the same way. I have before me as I pen this note a plant growing in a five-inch pot which has withstood a sojourn of several months in this room, and during that time it has continued to grow and develop several of its finely cut, pleasing green leaves, and has lost none of its freshness. The grevilleas are natives of New Holland, and will thrive luxuriantly in a cool temperature. By sowing a packet of seed annually a good stock of plants in various sizes will be maintained, suitable for the many purposes to which they are so admirably adapted.

As a "dot" plant in the flower garden this grevillea presents a pleasing and striking contrast to the flowering subjects utilised, whilst for intermingling with such plants as cannas, fuchsias, Lobelia cardinalis, and various other popular occupants of our flower garden they are very effective. What can be more beautiful to look upon than a large bed of Crozy's cannas, with the foliage of this graceful plant towering well above them? Such a one has been in these gardens during the past summer the admiration of everyone who has seen it. Old plants that have become somewhat leggy have been utilised for the centre, and the younger and dwarfer plants for the sides. These are lifted in the month of October and potted up for use in the conservatory and for room decoration in the winter months, and I find they are much better suited for corridors and places that are often draughty and injurious to plants than are many other foliage plants. Associated with various berried plants as Solanum capsicastrum, pernettyas in variety, also Euphorbia jacquinæflora, poinsettias, and other winter flowering subjects it is much better adapted than the more tender greenery ofttimes used.

The seeds should be sown in February on a hotbed in light sandy soil, and the seedlings afterwards potted on and grown in a position near the roof glass in a warm house until thoroughly established, when a cool temperature should be accorded them.

Stoneleigh. H. T. Martin.

CHRYSANTHEMUMS IN VASES.

From the remarks on pages 795 and 796 it must not be inferred I had in mind the difficulties judges would find in inspecting chrysanthemum blooms if five were arranged in one vase, but rather that visitors would not be able to "inspect" the blooms unless they were arranged where they could be seen from all sides. No arrangement of five blooms in one vase stood on a side stage can be so effective as a smaller number. If a collective display is the object in view the circumstances are varied, because it is not then a question of individual blooms but of the whole. Where a specified number of blooms is to be staged there should be no opportunity afforded for hiding any defect in any one of them. At the Edinburgh Show there were no less than twenty classes provided for chrysanthemums in vases—three, six, and even twelve blooms in a vase were required—but undoubtedly the finest effect was produced by the classes devoted to so many varieties, three blooms of each. In some few instances six blooms in one vase made such an effective display that little fault could be found, but in these cases where that number of blooms were required such varieties as Charles Davis, Viviand Morel, Duchess of York, President Borel, and Mrs. H. Weeks were specified as in all these a greater depth is obtained in the blooms than in the case of Mutual Friend, Simplicity, and such spreading varieties. I particularly noted the want of effect in six blooms in one vase, any variety. Not only were the blooms sadly crowded, but the inharmonious colour effect was all too apparent, as may be expected when a pure white blossom is so closely associated with a pale yellow. In a class for one vase of twelve blooms the crowding was even more noticeable, although much larger vases were employed.

As our Editor remarks, vases for sprays afford a pleasing contrast. At Edinburgh such a class was one of the most attractive in the whole show. The schedule reads, "three vases decorative chrysanthemums in three varieties, not disbudded, with any foliage." No less than seventeen competed in this class. The premier exhibit well represented the type of chrysanthemum best suited for room or vase decoration in combination with other foliage. The varieties were Source d'Or, Yellow Lacroix, and the bronze and golden yellow sport from La Triomphante; the foliage used was Spiræa aruncus, Eulalia zebrina, and fading asparagus tops. In the class at York alluded to by the Editor "twelve varieties, in sprays, not disbudded, and three sprays of each variety," was the specification. These had to be shown in jasper vases. I saw the competition, and thought how good the effect was, but at the same time thought some of the varieties were rather thin for the best effect, three sprays of some varieties being insufficient to give the desired bold effect. At York prizes are offered for single specimen incurved and Japanese blooms in separate vases, but there, as at Portsmouth, where a similar class used to be provided, the blooms had a poor effect.

At Windsor for years one of the most interesting classes in the whole show has been that for twelve blooms, any section, arranged in a vase or basket. Here other natural foliage is allowed, and this year there were eleven competitors. The quality of the blooms is a point of importance in combination with the effect produced by adding such foliage as purple beech, scarlet oak, ampelopsis, crotons, and palm leaves, fern fronds, &c. Such a class is a means of instructing the public how to employ large exhibition blooms in the decoration of the drawing-room or front hall. A similar class is provided at Ascot. At Liverpool prizes are offered for a basket not exceeding eighteen inches in diameter, suitable for a drawing-room table, filled with chrysanthemums, fern or other foliage. In such a class as this ample scope is provided for the exhibitor to employ large or small-flowered varieties at will. The leading exhibit was an effective one, mainly composed of Mary Anderson, the favourite single-flowered variety. As showing how little societies encourage the staging of chrysanthemums other than in the orthodox fashion on hard green stands in cups and tubes, I find from forty prize lists but sixteen include classes for the artistic display of blooms, and many of these are but for a single vase containing six or even nine blooms.

The Ulster Society offers prizes for thirty-six blooms in twelve varieties, to be shown in glasses. At Cardiff twelve Japanese blooms in four varieties, three blooms in a vase, are asked for. At Bolton no supports are allowed to the blooms staged in vases, and in this case varieties with stout stems must be employed. It is difficult for an ordinary visitor to notice a thin wire, which is invariably employed in arranging the largest blooms in the vases, and personally I see little harm in this addition, provided, of course, its appearance does not lessen the effect or be conspicuous. A few more object lessons like those at the Edinburgh Show will quicken other societies to make a change from the hard and fast lines of most shows held in the United Kingdom.

E. Molyneux.

The Flora of Western Australia.—According to Mr. Spencer Le M. Moore, the desert flora of Western Australia comprises 867 known species, of which 860 are Phanerogams, referable to 319 genera, distributed among 73 natural orders. Of the flora 58 per cent. consist of species ranged under 8 orders, with Compositæ and Leguminosæ heading the list, leaving 42 per cent. to be shared between the remaining 65 orders. Mr. Moore disbelieved the current theory of Scandinavian predominance; and the prevalence in Eastern Australia of forms of Indo-Malayan facies was held to be due, in great measure, not to immigration, but to descent from the primitive Tertiary flora. Moreover, the balance of exchange between Indo-Malaya and Australia, in favour of the former area, was considered as coming under the doctrine of chances, and not as implying any inherent superiority of the one flora over the other. While in Europe the Australian, *i e.*, the xerophilous element was, owing to change in climate, eliminated in favour of the present hygrophilous vegetation, in Eastern Australia the conditions remained as they were in earlier Tertiary times until desiccation set in. Mr. Moore considers that this desiccation dates from an earlier period in Western Australia; and that this, together with the isolation of the western portion of the continent in secondary times by a sea, and later by stretches of desert, explains the floristic difference between Western and Eastern Australia.

A VARIABLE BRITISH FERN.

MR. W. H. PHILLIPS, F.R.H.S., of Holywood, co. Down, contributes to the annual report of the British Pteridological Society a paper on that highly proliferous British fern, Polystichum angulare proliferum.

Polystichum angulare proliferum, observes Mr. Phillips, is the name so long in use for the series of ferns which have been divided into acutilobe, divisilobe, multilobe, and conspicuilobe.

In Moore's "Nature Printed Ferns," printed in 1859, the first discovery is credited to Choules, who is said variously to have found it at Wimbledon, Surrey, or in Devonshire. It was, however, at Kew Gardens, and distributed from there. Mr. Wollaston more recently found his form at Ottery St. Mary, and Mr. Jackson his at Barnstaple. This last is probably the form now called oxyphyllum.

Mr. Newman, in his "History of British Ferns," 1854, page 119, mentions only two varieties of angulare. The first does not bear on my subject, but the second variety, he says, "is still more remarkable." After describing it, he continues: "I believe this plant is very familiar to cultivators. The specimen given to me by Mr. Pamplin was from a plant cultivated by Mr. Choules, formerly gardener to Lady Guildford; it was found in a hedge near Wimbledon, and is preserved in the Royal Botanic Garden at Kew, and I possess a second, from Mr. Wollaston, gathered by himself near Ambleside. My notice of the denser pinnules has induced cultivators to call it 'angustatum.' A third form has been found in Ireland by Mr. Kinahan. In this strange and abnormal form the fronds are of small size, and all the divisions are atrophied or setiform." He then goes on to say, "There is a property possessed by this fern which is common to many exotic species, the production of new plants from bulbils at the axil of the pinnæ or pinnules." This state of the plant was fully described by Mr. Kinahan, under the name viviparum, in a paper read before the Dublin Natural History Society, 1852; but was at that time very familiar to botanists residing near London, and Mr. Wollaston had called my attention to it long previously to the report of Mr. Kinahan's paper. I do not know of the existence of this form; it does not appear in any catalogue. "Hooker's British Ferns," 1861, says "Aspidium angulare was published as a Hungarian plant by Wildenow more than half-a-century ago, and it was not until the appearance of the last volume of the 'English Flora,' in 1828, that it was recognised as a British plant." Hooker's "Species Filicum," 1846, makes no mention of proliferum. "Ferns British and Foreign," by J. Smith, of Kew, 1879, just mentions proliferum.

Mr. P. Neill Fraser, of Edinburgh, in his "List of British Ferns," compiled in 1867, gives the names of eleven varieties, a few only of which seem to be generally known and whose names are found in recent lists—Alchini, angustatum, Crawfordiæ, foliosum Ivery, Footi, Hardringi, Holeanæ, Marshalli, Padleyanum, tenue Clapham, Wollastoni. A. Stansfield and Sons' catalogue 10, 1875, has the form proliferum, and Alchini, Crawfordianum, Footi, Henleyæ, Holeanæ, Lyelli, Wollastoni. Sim, of Footscray, does not seem to have had many, or I should find them in my list of purchases. Backhouse, of York, catalogued in 1885 four varieties, and in 1893 four varieties, all the same—Crawfordiæ, Footi, Henleyæ, Holeanæ. Mr. Druery, in "Choice British Ferns," 1888, page 128, gives a selection of the best forms with descriptions. These are: divisilobes, four; d. cristatum, one; d. plumosum, one; multilobum, one; proliferum, five. F. W. and H. Stansfield's catalogues contain: acutilobum, four in 1885 and 1888; proliferum, nine in 1885 and four in 1888; divisilobum, two in 1885 and twenty-three in 1888. Stansfield's Catalogue, No. 7, contains: acutilobum, nine; proliferum, none; divisilobum, twenty-seven; divisilobum plumosum, six. Birkenhead's: acutilobum, two; divisilobum, eleven; plumosum, one. Lowe's "Nature Printed Ferns," 1874, mentions only about four forms. Lowe's "Handbook," 1891, enumerates: acutilobes, twenty-nine; divisilobes, thirty-one; d. plumosum, nine.

About 1884 the discovery had been made that ferns could be crossed in the prothalloid condition by mixing spores of different varieties and sowing thickly. This gave a great stimulus to the raising of new composite varieties, with the result that the number of varieties recorded in books and catalogues had greatly increased. Mr. Lowe, in his "Fern Growing," 1895, says: "The many and varied ways in which ferns can be raised are of great interest, and should make the subject one of great interest to botanists. The numerous distinct and handsome varieties of the British species have kept up an interest with horticulturists; the advance owing to hybrid varieties has been vastly greater than by wild finds; the former have been rapidly increased, whilst the latter have decreased; the fern explorer who used to be laden with new varieties now returns empty-handed, and it is only whilst we have new fields to explore that we may hope to obtain something new. Many of those who formerly employed their leisure in exploration now find it more profitable to devote their time to the raising of crossed varieties."

Mr. Carbonell raised divisilobum, grandiceps, stipitatum, and other fine forms of divisilobum. In 1885 Mr. Carbonell gave me spores from all his best acutilobes and divisilobes, from which I raised some very good forms.

The finders of acutilobes include Wollaston, Wills, Foot, Phillips, Gray, Rake, Mrs. Hartley, Moly, Elworthy, and Jones; and the raisers are Wollaston, Allchin, Jones, and Lowe.

The finders of divisilobes are Padley, Wills, Moly, Phillips, and Seymour; and the raisers Carbonell, Jones, Ivery, Moly, Pearson, Bagg, Plimsoll, and Stansfield.

The raisers of divisilobum plumosum are Jones, Pearson, and Fox.

The finds of proliferum are: 1852, Wollaston and Elworthy; 1860, Rake; 1861, Holeanum, Crawfordiæ; 1865, Gray; 1866, Padley, Phillips (three in Somerset); 1869, Henley (seven in Devon); 1870, Seymour (one in Hants); 1874, Wills, Moly, Phillips (five in Ireland); 1875, Moly; 1876, Wills, Phillips; 1888, King.

The varieties raised comprise acutilobum cruciatum, a. grandiceps Wollaston, a. Scopæ Lowe, divisilobum cristatum Jones, d. cristatum Ivery, d. deltoideum, d. dumetum Jones, d. dumosum Jones, d. grandiceps Carbonell, d. multifidum Jones, d. polydactylum Jones, divisilobum plumosum densum, d. p. Baldwini, d. p. laxum, d. p. Esplan, d. p. Pearson.

One of the most interesting chapters in fern evolution and crossing is that of the divisilobum plumosum section, by Colonel Jones and Mr. Fox. Mr. Lowe thus describes it in his "Fifty Years of Fern Growing": "Decompositum splendens has great interest attached to it, on account of its anomalous seedlings with much divided superb fronds, for up to the present time there is no knowledge of any of the seedlings bearing any resemblance to its parent. A short history of this fern is desirable on account of some confusion that exists as regards its origin. The honour of discovering this fern has been erroneously stated by Mr. Druery to belong to Colonel Jones. This is an excusable mistake, because two ferns now bearing this name were found. A variety called decompositum was found in Devonshire by Mr. Moule, and a seedling raised from it by Colonel Jones was named decompositum, and the plant is not bulbiferous, nor does it produce varieties like the plumoso-divisilobum. A somewhat similar variety has been found in Ireland by W. H. Phillips. However, the true or original decompositum splendens was found by Mr. James Moly, in Devon, 1875, and received the name from Mr. Wollaston. Colonel Jones gathered spores from this plant in Mr. Moly's garden, and these were sown in 1878 by Mr. E. F. Fox, though the latter was not aware till long afterwards that they were not from Colonel Jones's seedling. The anomalous character of the seedlings raised from these spores was so marked that Mr. Fox was unwilling to credit decompositum splendens with being the parent. Colonel Jones therefore made a special visit to Mr. Moly for additional spores, and was at the same time presented with a division of the plant. In 1892 Mr. Moly's plant produced a bulbil, which he presented to Mr. Lowe, and this accounts for the seedlings of decompositum splendens being more or less bulbiferous. The second sowing of these spores by Mr. Fox confirmed the fact that the former anomalous seedlings owed their parentage to decompositum splendens. Amongst the first seedlings were three, somewhat similar in character, yet distinct from each other. These Colonel Jones named plumoso-divisilobum laxum, p.-d. robustum, and p.-d. densum, all very fine varieties, the last mentioned being the most beautiful, in fact as beautiful as Todea superba. They are all sterile,* and require propagation by bulbils or divisions As regards the propagation by bulbils, plumoso-div. densum has bulbils that produce very different varieties from the parent. Colonel Jones raised two plants from bulbils in 1886 and 1888, gave one to Mr. Lowe and one to Mr. J. L. Baldwin. They were not only distinct from the parent, but quite distinct from each other. One was called imbricatum, and the other Baldwini, and is perhaps the most beautiful British fern yet known. From the second sowing by Mr. Fox there was only one that was very distinct; this is called gracile." I have in cultivation, 1898—acutilobum, 29; divisilobum, 36; d. plumosum, 5.

Polystichum angulare proliferum Wollaston (Woll.), found in 1852, is a true acutilobe, frond elongate, deltoid, tripinnate, in its best character has only two pairs of bulbillæ seated in the axils of the lowest pair of pinnæ, pinnules acute. No British fern exceeds this in beauty, and probably none has figured so prominently in exhibitions; it is not to be wondered at, therefore, that it should have taken more than one person to find it. Mr. Wollaston relates that himself and the late Rev. W. Gardiner, then curate of Ottery St. Mary, during a ramble in that neighbourhood being brought suddenly by a bend in the lane face to face with it were at the same moment (it was then a large plant, and in true character) transfixed with astonishment. Mr. Wollaston was, however, the first to recover his presence of mind, and the plant will ever deservedly bear the name of the first of British fern hunters.

The name "proliferum" was first given to a plant found by S. Choules, one of the Kew gardeners. Mr. Wollaston states that an impression prevailed that at one time it was exotic, probably from its differing so much from other then known British ferns. Dr. Allchin writes that in 1852 this plant was growing in the outdoor fernery at Kew, marked "P. a. dissectum," and afterwards angustatum, and it was from spores of this that he raised the very beautiful proliferous form that bears his name, which was far more so than any that have since been found or raised. Choules's plant being the first to show its character was named by Mr. Moore "proliferum." Subsequently other proliferous forms were found, and named proliferum Wollastoni, Footi, Crawfordiæ, Holeanæ, Henleyi, Moulei, &c. As all these partook more or less of the finely cut character of the original proliferum, and no other proliferous form was then known, it was thought by some that the proliferous character was more or less the habit of that class, and that it was confined to it; subsequent discoveries, however, proved that in neither respect was this the case, the name therefore lost much of its appropriateness. It is true that in a general way the finely cut varieties have a more general tendency than others to be proliferous, but it is now known that this habit is very general among varieties of angulare, and is sometimes seen even in the normal form.

Mr. Padley writes that he has generally found that the ferns having a hard woody rachis are the ones most proliferous, such as acutilobe, multilobe, lineare, &c. Forms of brachiato-cristatum are nearly always proliferous, and in some cases not only near the brachiations. Mr. Wills's pulchermum and some forms of revolvens are proliferous, and a variety of cristatum, found by the late Dr. Moore, in Ireland, has often bulbils extending halfway up the frond. It is also now known that there are varieties which in every important particular are identical in character with the proliferous forms and yet they are not proliferous, or only slightly so. It would seem that the proliferous habit is both too general and too arbitrary in its appearance to entitle it to give a name to any class of varieties. Nor is the name at all descriptive of the very marked character of the class to which these, perhaps the most beautiful of all the forms of angulare, belong. The variation of character among these finely divided varieties is known to be so great that they can no longer be mingled together without considerable confusion of ideas. Mr. Wollaston was the first to meet this difficulty by a sub-division of the class of finely cut varieties into three classes: Multilobum, an excess of decompositum, the whole plant being more or lese tripinnate, but the division of the pinnules or pinnulets more or less abnormally rounded. Acutilobum, tripinnate all the divisions of the fronds acute, anterior and posterior pinnules nearly the same length. Divisilobum, tripinnate, the same as acutilobum, except that the anterior and posterior pinnules are of unequal length, the latter far longer, and the divisions altogether more highly developed. A well-grown plant is sub-quadripinnate, or even quadripinnate.

By the almost unanimous consent of angulare hunters and cultivators Mr. Wollaston's arrangement has been adopted, and the name proliferum is no longer used, except as an adjunct to denote that either such multilobes, acutilobes, &c., have such a habit, or such as have long been called by that name. Thus the original proliferum and Mr. Wollaston's, are proliferous acutilobes; Miss Crawford's, Mrs. Holes', and Mrs. Henley's are proliferous divisilobes.

Mr. Padley, whose experience in this class of varieties was perhaps unrivalled, and who studied the matter with at least as much interest and care as anyone, was in favour of Mr. Wollaston's arrangement, as far as it went, but he still retained the name conspicuilobe as descriptive of the varieties which do not quite come up to multilobes or acutilobes, though evidently partaking of the same "gentle blood." Mr. Padley wrote: "With me there are two principal divisions of the varieties whose pinnules are much divided: the tripinnate or decompositum class; and the acutilobe class (comprehending conspicuilobum, acutilobum, and divisilobum), the main feature in the former being that the pinnules are more frondose, and in the acutilobes more acute and narrow."

Multilobum, or, as he preferred to call it, equilobum, seems to lean to the two divisions—one section to decompositum, the other to acutilobum. My order of the more finely cut varieties is conspicuilobum, multilobum, acutilobum, and divisilobum. Some people have cast doubts on conspicuilobum, but I consider it a distinct variety.

---

* Note by Mr. Druery: Spores are occasionally produced, and I have raised several typical plants therefrom.

If to these four classes be added the two classes of decompositum—the ordinary, and the higher or more developed class, called here tripinnatum—it will be found that, with very few exceptions, the whole of the divided or multilobe varieties will drop into their places very naturally. The expression, "gentle blood," has been here used as expressive of that look of quality which seems to distinguish the finely divided forms from all others.

Whoever has once seen a real acutilobe or divisilobe, well grown, half or two-thirds unfolded, with its wealth of feathery foliage spreading from the centre—so finely cut, and yet so evenly crowded together—the dark green of the unfolded part contrasting charmingly with the clear white of the curled-up heads of the fronds that turn gracefully back, crozier-like—with the tips of the pinnæ still folded up, and standing out like rows of little frosted-silver balls along the outer edge of the frond, and the rich, thick fox-coloured scales that cover the stem, running right up the centre of the fronds like a bit of sable fur, and the fine hair-like spines standing up from it everywhere, for the dew to rest on or the sun to shine upon; whoever has once seen this mixture of form, detail and colour can hardly help regarding it ever afterwards as distinct from other polystichums. And it is not cultivation only that does it, for often has the eye of the fortunate angulare hunter been struck by a similar contrast—as, for instance, when Mr. Wollaston came face to face with his acutilobe, or when Mr. Wills, with that magical hooked stick of his, uncovered his Sidbury divisilobe from the common leaves that hid it; there they stood out, distinct among their fellows—just like bits of china among earthenware—clearly enough nature's gentlemen; and we may be sure it takes at least three generations to make them such, for it can hardly be credited that such forms start from the normal type.

My experiences do not tally as a fern hunter exactly with others, for although I have found one good divisilobe and two acutilobes, only one (an acutilobe) was quite characteristic when found; the divisilobe was, when found, a very fine erect plant, lax, and very nicely divided, one of the forms from Castle Coole, setoso gracile, and it was not for a year or so afterwards that it developed fully into a divisilobe. My acutilobe "exile" was taken on account of the anterior basal pinnules diverging from the rachis. I have now two wild finds, bought in the market from hawkers, which at present, the second year, will prove divisilobe and acutilobe.

Who can foretell the future of Polystichum angulare proliferum? This is the most difficult part of my task; but, relying on what has been done in the past, both in angulare and other species, it is very probable that many forms may be crossed with both acutilobes and divisilobes. Some of the crosses may spoil the original characters, and others improve them. About twenty years ago the late Colonel Jones, Mr. Greer Malcolmson, and myself were on an excursion to Tollymore Park, co. Down, situated on the Mourne Mountains. While walking along, the topic of the ferns of the future was started, and in a joking way we each proposed what we then thought the most absurd amalgamations of varieties, this only in the finding of wild forms. But afterwards we found that many of these unattainable forms were produced by crossing. The plumosum form has already been produced in divisilobum, and it may be possible yet to introduce brachiate, revolved, flexuose, variegated, setose, cristate, grandiceps, percristate, and tripinnate forms, and to hybridise with aculeatum. Likewise with acutilobum, the forms cruciatum, grandiceps, polydactylum, multifidum, and cristatum are to be had. We may have the possibilities in the future by crossing with revolvens, flexuosum, variegatum, setosum, brachiatum, gracile, percristatum, tripinnatum, acrocladon, corymbiferum, rotundatum, and with aculeatum. And with divisilobum we already have cristatum, polydactylum, grandiceps, and decorum polydactylum, and these can be crossed to an infinite extent.

IS THE ONION SURFACE-ROOTING?

THE belief that onions are mere surface-rooting plants is due to the old practice of placing manure for them rather near the surface, which, as a consequence, led to the development of roots laterally rather than longitudinally; but anyone who raises onions from seed on soil that has been deeply worked soon finds out on lifting plants that even whilst yet not more than eight to ten inches in height roots have gone down vertically fully ten to twelve inches. The newer culture, as exemplified in deep trenching and deep manuring of soils for the production of giant bulbs from plants raised under glass, and put out in the spring when strong and well-rooted, has revealed the actual habits of onion roots, as these, under this form of growth, have been found to go down fully two feet and even further. Mr. Bowerman, who is one of the leading growers of onions, once told me that for experiment he carefully removed the soil from onion roots and found them perfectly straight that depth in the soil. Were it not for this habit we should never obtain the gigantic bulbs now seen. These are more largely (relatively to the smaller bulbs) composed of water, and they could find their needful abundant supply of moisture only in very deeply prepared soils. It is odd that with so dry a season as the past summer has been we should have recently seen the largest onions ever produced. Had the plants been surface-rooters not all the watering possible in such a season would have created such monsters. They owe their size to warmth on the surface aided by such deep root run, for no doubt the ground on which they grew had been worked and manured to a depth of fully three feet. Of course, a good deal of feeding is given by the aid of liquid manures applied from the surface, but in soil so deeply and thoroughly worked this liquid food sinks deep. Still further, we know that roots do not absorb their supplies of food through root tips, as was formerly believed, but through minute root hairs, which cover the surface of all roots and find food wherever it can be obtained.

But, after all, the main point is the nature of the attractive force exercised by gravitation on the one hand, and almost of intelligence, or something else, not easily explained, on the other, which seems to compel root tips or borers to strike deep wherever practicable. It seems to be a recognised fact that if we place manure, or plant food, within fair reach of them the roots will instinctively find their way to it. If that be so, it is no matter for surprise if onion roots, finding the soil free deep down, and manure lying deep down, go after that manure, and find it; but in doing so they are also in dry weather finding a great essential to life and growth, moisture, which they could not find near the surface unless artificially furnished. After all, such deep culture as is now given to onion production is but the secret of success in all garden culture. Nine-tenths of the plants we grow in gardens, and vegetables especially, will root deep and vertically if the soil will admit of deep penetration. That same attractive force which invariably causes the root of the seedling to strike downwards into the soil, just as light attracts the stem upwards, operates on roots of plants of more advanced age. After all, there is nothing in garden culture so important as deep working of the soil.

A. D.

HORTICULTURAL EDUCATION.

THE question of the education of gardeners is worthy of our best consideration, nay, urgently demands it, as it is an obvious fact that we live in progressive times, and unless we move in accordance with them we shall soon be placed at a great disadvantage. Especially is this education needful to those whose province it is to supply our markets. The tide of imports cannot be stemmed, it increases in volume year by year, with a consequent lowering of prices. If we cannot grow more produce to keep out the foreigner we must endeavour to grow better and more economically. We must learn how to combat our insect foes, to overcome or prevent fungoid diseases, and by a system of judicious manuring bring our crops to the greatest perfection in the least possible time.

Our fathers, mayhap, produced good crops even when they looked upon the soil as an inert mass. Owing to the wonderful discoveries of modern times we are enabled to view things in a very different light, we know that the soil teems with life, bacteria, nitrifying organisms, &c. When we are enabled to follow intelligently the processes of these mysterious agents in the conversion of material into plant foods, which we are only just beginning to understand, surely we may hope for superior results. Or let us take another view of the soil, the theory if you like to so call it, of every particle of soil being enveloped or surrounded by a film of moisture and on the preservation of this film of moisture the welfare of our crops and the fertility of our soil largely depend. How can we preserve this film, or how can we assist these nitrifying organisms, without the light and understanding which is concomitant with the true education which simply means training, the training of the eye to observe and the brain to reason and understand. When we turn to the plants, what a wonderful thing is their life-history, yet we pursue our work amongst them day by day without a thought, mechanically as it were, giving them a certain amount of water and expecting them to do a certain amount of work, without realizing the fact that this work is the most mysterious thing in the whole world. Does not education bring appreciation of these facts? Who needs this education more than gardeners, and who receives less? The principal reason, I believe, is this. Our work is not understood, certainly not appreciated; consequently we rarely receive any encouragement, unless it is under exceptional circumstances. To "the man in the street" we are "only gardeners," akin to the genus "labourer." How few there are like the Right Hon. James Bryce, M.P., who "remembered to have been often struck with the fact that there were four classes of people who followed arts and occupations which required great skill—bankers, engineers, instrument-makers, and gardeners" (*vide* page 756 GARDENERS' MAGAZINE, December 4, 1897). Skill and knowledge (partly synonymous) we certainly do require if we are to do credit to ourselves and give satisfaction to our employers. How is this knowledge to be acquired? Only by a course of systematic study and preparation can we acquire it. Unfortunately we possess no State-aided schools of horticulture, like our continental neighbours (a typical one is illustrated and described in the GARDENERS' MAGAZINE for April 9, 1898); splendid aids these must be. The R.H.S. with its Chiswick gardens is undoubtedly doing good work, but is only within reach of the favoured few. Hopes may be expressed for the horticultural departments of many of the County Councils in the future when fully organised, but for the present we have little to rely upon except our own efforts.

Throughout the length and breadth of the land we have innumerable local horticultural societies; these apparently consider their duties begin and terminate in an annual show. This should not be so; every society worth calling a society should hold meetings where plants could be exhibited, if new, rare, or interesting, and papers read by various members, followed by debates and discussions; how helpful these to the junior members! This method seems to be far more general in the southern counties; with a few noted exceptions, it is practically unknown in the north.

The gardening periodicals, like the GARDENERS' MAGAZINE, hold a foremost place in the work of education or dissemination of useful practical and scientific knowledge; a good text book on structural botany should certainly be studied, followed by one on systematic botany, then one bearing upon the geographical distribution of plants, chemistry, organic or agricultural, should not be omitted, neither should geometry nor geology and the standard works on horticultural subjects. The R.H.S. recommends a special list for use in connection with its examination. Mention of examination brings me to the concluding point. Many young gardeners would like to become candidates for the R.H.S. certificates, but fear to enter the lists, under the belief that the theoretical prevails over the practical. This is a moot point, frequently discussed, but never satisfactorily settled; but, in order to encourage young gardeners, could not the examination be held on the following lines to the satisfaction of both the practical and theoretical sections? A few months ago the English Arboricultural Association held an examination for foresters at the Yorkshire College, Leeds. Dr. Somerville, of the Durham College of Science, formulated a set of questions on forest botany, &c. These papers were worked at the Yorkshire College one day, the candidates assembled in Harewood Woods the following day for practical tests, such as planting, felling, and measuring of fallen timber, &c. The value of this outdoor examination in the actual work was considerably augmented by the fact that the examiners were all practical men, such as land agents and surveyors. The certificates granted to the successful candidates are not too easily obtained, stiff work must be done in each section, but when obtained they carry far greater value on the face of them than those gained merely by a display of theoretical knowledge, and tend to raise the possessors of them in the scale of foresters by proving them to be qualified to hold first-class appointments on important estates. Cannot this system be adopted by the Royal Horticultural Society?

F. DIXON.

BAHAMA DUCKS.

THIS is a very pretty variety of the duck, specimens of which are frequently seen at exhibitions. The following description appeared in the *Bazaar* some years ago: "This variety, termed by naturalists the Bahama Marbled Duck (*Dafila Bahamensis*), is in length about 18½ inches, and 1¾ inches in bill, which is of a lead colour, reddish on the sides. In the young it is of a red-brown, the colour changing as in the Rouen. The tail and back are brown, edged with a light brown. The crown is a sepia-brown; the breast grey, spotted brown; the wing spot or bar is a metallic-violet, with a narrow strip of buff on the front side, and a broad one on the back; the legs are of a dark colour." There is no dissimilarity between the sexes. Latham, an old and great authority, gives the length of the Bahama as 21 inches, and says that the bill is a lead colour, marked on each side and near the base with a triangular spot of orange. The variety is found in Brazil and the Bahamas. It is also known as the Ilathera Duck, as Canard de Bahama, and Le Marec. It perches on trees, and does not migrate north to breed.

E. B.

WORK FOR THE WEEK.

COOL ORCHIDS.

ORCHIDS that flower during the winter months have an exceptional value, even if they are common varieties, as they all serve the same purpose. Where a large quantity of cut flowers is in demand the old but still popular Cypripedium insigne is without doubt one of the best winter-flowering orchids we have, as the handsome blooms when cut remain fresh for a considerable time, and in nearly every garden, where indoor plants are cultivated, this old species will now be found in bloom, it having become such a favourite amongst gardeners, owing to its vigorous constitution and easy culture. The better varieties, which are also in flower, are certainly not so plentiful, such as C. i., Harefield Hall variety, C. i. Upland's variety, C. i. Dorothy, C. i. Sanderianum, &c.; but undoubtedly the most beautiful and distinct of all varieties is C. i. Sanderæ, which is only represented in the choicest collections at present. Then there is C. Spicerianum, another useful species in flower at the present time, and deserving as wide culture as C. insigne; although not such a vigorous grower, the mode of treatment is somewhat similar, and the pretty flowers with their distinctly striped dorsal sepal make a good show. There are a few named varieties in existence, the best of all perhaps being C. S. magnificum, a large and very superior form when obtained true. Other cool growing cypripediums, to flower during the winter months, are C. purpuratum, C. venustum, C. Charlesworthi, and the hybrids C. Arthurianum, C. Leeanum, and C. nitens. Cypripediums delight in abundance of water at the roots, especially during the summer months, but now during the short days of winter only sufficient should be given to keep the compost nicely moist; and when affording it avoid letting the water lodge in the growths as much as possible.

Where Odontoglossum crispum is grown in quantity there are nearly always a few spikes of flowers to brighten up the house during every month of the year, and at this dull season they are exceptionally valuable; the flowers certainly do not expand so well now as they do during the spring and summer months. Many buds are lost if foggy weather sets in. It is, of course, in the neighbourhood of large towns and manufacturing districts that these fogs prove most disastrous, as they are so charged with smoke and various gases. So far we have been very free from fogs this year. Odontoglossum Rossi, which grows in company with the O. crispum, is certainly a very charming little winter-flowering orchid, coming in most useful for buttonholes or any other purpose to which orchid flowers are adapted. These plants are of easy culture, and may be had in flower from the latter end of November until April and May. Other useful winter-flowering orchids are found in Lycaste Skinneri, and its varieties, Maxillaria grandiflora, M. venusta, with sweet-scented flowers, and Sophronitis grandiflora, the brilliant scarlet blossoms of this delightful little species being now open; and, lasting as they do for a month or six weeks in perfection, their value is obvious, and they also impart a very cheerful appearance to the cool house during the wintry days. The plants should be afforded plenty of moisture at the roots until the pseudo-bulbs, from which the flowers are produced, are fully matured. After this there is usually a quiet season for a time, when a much smaller supply of water will suffice, but even then the compost must never be allowed to become absolutely dry. The repotting of these plants may be done immediately after the flowers fade, or when growth commences, using shallow pans, three-parts filled with drainage, and a compost consisting of equal parts fibrous peat and sphagnum moss.—E. SHILL, *New Hall Hey Gardens.*

CONSERVATORY AND GREENHOUSE.

IN writing this calendar we confine ourselves as much as possible to such work requiring attention at the time. We are now, however, at a season when the usual daily operations of the plant grower are often interfered with, extra house and other decorations claiming a fair share of attention. On no account should this lead to neglect in the way of watering plants, ventilating the different houses and pits, and regulating the atmosphere of the houses both day and night. Such details, if not carefully attended to during this busy season, would lead probably to much loss and disappointment in the future. Apart from the use of holly and evergreens by the decorator at Christmas time, there is always an extra run on plants in variety, as well as cut bloom, forethought and judgment often being necessary in getting the supply to meet the demand. With cut bloom alone, it is always best to depute one man to manage this as far as possible, as he will know what reserve cut bloom he has to work upon, and act accordingly; whereas, when several men are set to work to gather the supply, there is often a waste of valuable flowers. With care the same flowers may be used the second or third time, such as when poinsettias are employed for table decorations; they are much too valuable to be cast on one side. We generally have them collected carefully, tied loosely in small bunches, and then insert the stems in a tank of water in a cool house. Here they remain quite fresh, and retain their foliage better and longer than it is possible for them to do if placed in heated reception-rooms, they form a reserve ready for the decorator, and save a waste of material. Valuable plants are also used, and especially tall, graceful palms, to decorate corridors and rooms. Such positions are generally kept heated by artificial means at this season, a most trying condition for the plants to be under for, perhaps, a fortnight. Neither is it always possible to afford sufficient water while they are being used for such purposes. It therefore becomes very necessary to see that each one is thoroughly watered before being taken in; and, moreover, by placing a good pad of wet ground moss over the surface of the ball, it greatly assists to retain moisture in the soil, as well as giving a neat finish. Plants growing in small pots are often used for margins of groups and for filling baskets. These naturally suffer more quickly than much larger ones for the want of moisture. Indeed, not infrequently they have to be turned out of their pots before they can be used in the desired way, especially small ferns and table plants; therefore they should be prepared for the ordeal by careful and copious watering first, and using plenty of wet moss about them afterwards. This saves much labour in attending to them after when placed where water cannot be used freely, and also the anxiety of fearing they may flag or collapse at a time when they should be looking both bright and fresh. Many object to resort to the unnatural method of wiring cut blooms, but there is no gainsaying but what it proves of great assistance to the florist, not only in making up pleasing arrangements, but a greater display can be made with a few blooms so treated, as they can be fixed in the desired position and made the most of, which is not possible when wire is not used about the stems. Of course, we often see the work of wiring cut bloom done very clumsily, which brings it into ridicule, but when neatly performed with deft fingers so that the wires are made to support the stems, without being exposed or thrust roughly through the bloom, its aid is a great gain, both in arrangement and, what is of great importance at mid-winter, a saving of bloom. Nice little green pieces of moss should first be twisted round the stems to save the binding wire bruising them, and not unsightly tufts of cotton wool commonly seen.—RICHARD PARKER, *Goodwood Gardens.*

KITCHEN GARDEN.

AT this time of the year, when weather permits, digging as far as possible should be proceeded with and brought to a close, for it is a mistake to work on land when wet, as this renders it unfit for sowing or planting for a considerable time afterwards. The experienced cultivator will bear this in mind, as he knows full well the evil effects that arise from puddling the ground, as it were. Better by far defer operations than attempt to cultivate land when in an unfit state. The mild weather has enabled work of most kinds to be pushed forward, so that there can be little excuse for having any arrears. We shall soon be receiving seed catalogues, reminding us that the time has come when plans for the coming year must be thought of; and, as it is not well to delay the ordering of seeds until they are required for sowing, it is well during the long winter evenings to look over notes of the last season's crops as a guide for future orders. No two places are alike in respect to the consumption of any particular kind of vegetable; it is, therefore, useless to attempt to advise on this particular point. But, if gardeners have from time to time taken notes of the various kinds of vegetables most in request, they will doubtless be in a better position to make out their seed orders.

Those who have room to grow peas under glass may sow now for gathering towards the end of April. Peas will not stand forcing, neither will they put up with the drying atmosphere of hot-water pipes. Those who have large, airy houses may grow them very successfully with little trouble; failing these, pits are more serviceable than small, ill-ventilated structures. Where there is room it will certainly pay to grow the taller varieties, such as Gradus, Empress of India, Early Morn, Early Giant, and the like; but for small houses or pits the dwarf kinds must be sown. Chelsea Gem, William Hurst, Sutton's Forcing, Carter's Forcing, English Wonder, and such like are all first-class varieties growing about two feet high. The question has often been raised whether it pays to put sticks to such dwarf varieties, and to this I say, without doubt where the most has to be made of a limited space, then staking will certainly pay. I have taken four bushels of pods from one hundred nine-inch pots of Chelsea Gem, which, though not a large-podded variety, fills up well. Carter's Forcing, too, is an enormous cropper, and should not be lost sight of. For those who want larger podded varieties of dwarf habit Daisy, Sutton's Seedling, Perfect Gem, and Dwarf Defiance will suit them. When grown in pots it is far preferable to sow in small ones, and pot on, than to sow at once in nine-inch pots, as space is economised in the first instance. It is a great mistake to sow too thickly, as ten or a dozen plants are ample for one pot; therefore if the seed be good there is no necessity to plant more than that number. When grown in pits eighteen inches ought to be allowed between the rows, and the plants will give by far better results if they do not stand so close together in the rows as some people like to see them.

The days will now soon be lengthening, therefore French beans will grow much faster and set more freely. As a less time will be needed to bring the crops to maturity, calculations must be made accordingly. Those sown now, if a proper heat be maintained, will be ready to gather about the middle or end of March. Seakale will now force more readily, particularly if they have been exposed, as growth will then have been arrested. Batches should be introduced at intervals as required that there may be no blanks in the supply. Chicory will also blanch readily now, and as this is not only a wholesome salad, but also a good vegetable, it should be grown more largely than it usually is. Up to the present time, the weather being so mild, there has been no necessity for protecting any vegetable crops; we may, however, expect a change at any time. This being so, material should be had in readiness in case severe frost should visit us. Lettuce and endive that are still exposed will suffer after such mild weather; therefore where an open shed or pit can be afforded these should be got under cover before the frost takes hold of them. Make small sowings of mustard and cress, and introduce into gentle heat boxes of mint, tarragon, and other herbs required.—H. C. PRINSEP, *Buxted Park Gardens.*

FRUITS UNDER GLASS.

A STEADY but not forcing temperature of about 70 degrees or a little under, without sun heat, and a dry atmosphere, should be preserved in the fruiting pine house. Damping down and syringing between the plants should, if not entirely suspended, be reduced to a minimum, and only done in the mornings of fine days, and this only in houses that are well favoured in the matter of light and position. The bottom heat, too, should be kept steady at about 10 degrees or 15 degrees higher than that recommended for the house itself. An eye should be kept on the stock plants which are expected soon to be showing for fruit, and as soon as signs of this are seen these should be arranged together and plunged in some fresh fermenting material that will keep the roots vigorously active, for once this stage is reached any further attempts to rest the plants will only spoil the embryo fruits by causing them to become stunted and mis-shapen. These plants will require more water than the rest of the stock, as they must never be allowed to become quite dry at the roots during the time fruit is forming. Smaller stock in all stages down to the most recently potted suckers should be kept for the time in as low a temperature as is safe and have very little water, so that growth is almost arrested, for any growth made now will do more harm than good eventually, and it is best to keep the plants almost dormant until the days begin to lengthen.

Where leaves form the fermenting medium for the plunging beds no opportunity of collecting a sufficient stock in suitable (dry) weather should be lost, as they may be heaped up in some convenient place, and will then be impervious to snow or cold rains, which do much to destroy their best properties when allowed to penetrate them while lying in the hollows into which they have been blown or dropped. Orchard house pot trees of various fruits, where still outside to retard, should have the litter with which the pots have been surrounded for some time past removed, and replaced with dry material of the same kind or with dry leaves, to protect the pots from bursting under the influence of severe frosts, and also that they may be readily removed under cover whenever this becomes necessary, whatever the weather may be. Though frosty weather is good for the trees it is not good for their roots, especially when confined to pots and exposed to all fluctuations of temperature. If very early melons are desired it will be necessary now to sow some seeds for the first house, but I never like to depend entirely for this crop on seeds sown before the new year, and make a practice of sowing two or three lots at intervals of a few days, and selecting the best of these for growing on, as the kind of growth made by many seedlings at this period is not of the best except in surroundings of the lightest and most favourable description. Another thing which it may be well to remember is that old seeds, provided that they are not over six years old and have been well preserved, germinate best, and make the most fruitful plants. This is not in keeping with one's experience with other things, but it is an undoubted fact with melons. As fast as room can be found for them more strawberries should be brought under cover, and started slowly, after having had the usual dipping, picking over, and cleansing of the pots, following the routine lines laid down in a former calendar.—J. C. TALLACK, *Livermere Park Gardens.*

EXHIBITIONS AND MEETINGS.

ANCIENT SOCIETY OF YORK FLORISTS.

THE annual dinner of this ancient and flourishing society was held at the White Swan, York, on the 16th inst., when as is customary there was a large muster of members and friends. Alderman McKay, J.P., presided, and was supported by the Lord Mayor of York and the Sheriff of York and other notabilities of the city. After the loyal and some other toasts had been given, and had met with a hearty reception,

The Lord Mayor proposed "The Ancient Society of York Florists," and said that he was always deeply interested in the work it was doing. He occupied the position of vice-president of the Grand Yorkshire Gala Committee, and it was a genuine pleasure to know that the two societies were such unqualified successes in the city. The work which the florists were doing was totally different to that of the Grand Yorkshire Gala, and he maintained that there was ample room in the city for the continuance of that good work, and he was glad to find that the florists were endeavouring to keep themselves abreast of the times. It was a great pleasure to him to know that they had increased their prize list. He was told by their President that during the past year they had given away £200 in prizes. It was most creditable to them that they were in a position to do that beside the other good work they were doing in the city. He was told that their financial position was a fairly strong one. He had been a member of the society for twenty years, and had always taken a great interest in the work of the society for a great number of years. The shows from time to time were also deeply interesting, and it was a great treat to pass through the Guildhall during any of the minor shows. At the recent chrysanthemum show they had one or two new features which he never noticed before, and he would specially notice the exhibition of vegetables. He believed that they were indebted largely for that exhibition to the munificence of their president. Owing to death the society had lost a number of members, and he hoped that if there were any present who were not members they would join at once. It was to the best interest of the city as a whole that the success of the society should continue.

Mr. G. Lamb, treasurer, responded. The society believed that they had been doing good work, and from the kindly way the toast had been received they felt that that work was appreciated. He spoke of the loss of membership by death, but owing to the enrolment of new members the subscriptions amounted to exactly the same amount as the preceding year. The revenue from the chrysanthemum show this year was £5 more than during the record year. They had given during the year £260 in prizes, nearly £70 being for the minor shows, from which they received no revenue, and they had never been better than they had this year.

The Sheriff proposed "The President, the Vice-President, Officers, and Committee of Management," and the President, in response, expressed the great honour he felt it in being elected president in succession to Archbishop Thomson and Sir Joseph Terry, who held the office in succession for forty-six or forty-seven years. It was his intention to endeavour to bring the society up to what should be its proper position—a cordial co-operator with the Grand Yorkshire Gala. He asked them to add the Lord Mayor and Sheriff to the list of vice-presidents. They had, he said, a very hard-working committee, and if it was not for them it would be impossible to continue the work of the society. He spoke in eulogistic terms of the work of Mr. Lazenby, who had been secretary for twenty-five years, but through ill-health he felt compelled to resign that position, though he had no intention of separating himself from the society. If there was one feature of the society more than another worthy of encouragement, it was the minor shows, for it was the lover of flowers pure and simple who could visit them. They might depend upon it that the question of forming classes of instruction in floriculture by the Technical Instruction Committee of the Corporation would not be allowed to sleep, for he believed they would be of great advantage to the young gardeners of the city. He did not see why there should be any rivalry between that society and the Grand Yorkshire Gala but a friendly rivalry, which would ensure a hearty co-operation between them.

Several other toasts followed, including "Kindred Societies" and "Subscribers and Donors of Special Prizes."

NATIONAL DAHLIA SOCIETY.

THE annual meeting took place at the Hotel Windsor on the 13th inst., Mr. T. W. Girdlestone, M.A., the president, in the chair, there being a large attendance of members, including a considerable contingent from the country. The notice convening the meeting having been read and the minutes of the previous annual meeting confirmed, the Secretary (Mr. J. F. Hudson, M.A.) read the report, the substance of which was to the effect that the past season, owing to the prolonged drought, had been unfavourable to many growers, some of whom could not show, while others could exhibit only sparingly. It was also remarkable that the dahlia bloom was prolonged much beyond the usual time; dahlias were in flower up to the middle of November. The show last September did not equal in extent that held in 1897, and, owing to the incidence of the season, it was only natural there should be some falling off; still, the number of entries showed but little diminution. The show and fancy varieties were not up to their usual mark; still, very good blooms for the season were staged. The cactus type, on the other hand, was numerously and very finely exhibited, and new varieties increase with great rapidity. The class for cactus varieties shown on boards brought many entries. It is suggested they be shown in the future with the accompaniment of foliage. Certificates of merit were awarded to new cactus varieties somewhat sparingly, notwithstanding a large number were exhibited. The single dahlias were shown in good character, and appeared to be rising in popular favour. Further provision is necessary for classes illustrating the decorative value of the dahlia. The catalogue of dahlias prepared by the president and other members of the committee has been favourably received, and many non-members have made applications for copies. It is proposed to formulate a scheme for the affiliation of provincial societies. The thanks of the society were given to the donors of special prizes, and testimony was borne to the increasing interest shown in the cultivation of the dahlia.

The financial statement showed an income of £202 2s. 7d., including a balance of £21 1s. 1d. brought over from last year. Subscriptions brought £79 7s. 6d., and donations £20 12s. 6d. The remainder of income was made up of donation from the Crystal Palace advertisements in catalogue and schedule, &c. Prizes were awarded to the amount of £134 11s., and other items brought the expenditure up to the amount stated. On the motion of the Chairman the report and financial statement were adopted for circulation in the usual way.

Mr. T. W. Girdlestone was re-elected president; Messrs. T. W. Sharp, R. M. Hogg, and T. Hobbs, with the previous vice-presidents, were elected; Mr. E. Mawley was re-elected treasurer; Mr. J. T. Hudson, secretary; and Messrs. W. Treseder, Cardiff, and G. Gosney, Southall, were added to the committee.

The list of true cactus dahlias published in the schedule was revised. Several of the older varieties were struck out, and the best novelties of the past season added.

The proceedings closed with a cordial vote of thanks to the chairman, treasurer, and secretary.

THE HORTICULTURAL CLUB.

THE usual monthly dinner and conversazione took place at the rooms of the Club on the 13th inst., and there was a good attendance of members. Mr. Harry J. Veitch (vice-chairman of the club) presided, and there were present the Rev. W. Wilks, Messrs. Martin R. Smith, Ph. Crowley, Selfe Leonard, James H. Veitch, Gosling, Salmond, Geo. Monro, Peter Kay, J. Tillman, Geo. Bunyard, Shoults, Bassett, and the Secretary.

The discussion was on size in flowers, fruits, and vegetables, and was opened by an interesting and amusing paper by the Rev. W. Wilks, who deprecated the vulgar taste for large things in the strongest terms. He alluded to the absurd size to which chrysanthemums are grown, and asked what lady would use them for the purpose of decoration? It was the same with fruits. The huge Gros Colmar in grapes had almost superseded all other kinds in the market. And so in vegetables. Immense onions were grown, from which nearly all true onion flavour had been eliminated, and brussels sprouts like young cabbages had superseded the delicate flavour of those of former days. He hoped that there were signs of returning common sense and clearer perception of beauty, and said that probably the worst offenders were provincial societies, with whom size was everything, and the man who could produce the biggest cucumber, vegetable marrow, or onion generally came off victorious.

Mr. Martin R. Smith said that sometimes the size of Souvenir de Malmaison carnations was adduced as a proof of this vulgarity, but the fact was that this race was entirely distinct from the ordinary type of carnation, of which its foliage was a clear proof; its origin was unknown, but of its distinctness there could be no doubt. Mr. George Bunyard, as a fruit grower, said the same thing held true with regard to fruits. Big gooseberries, whose only recommendation was their size, had in many gardens superseded the fine flavoured sorts, and such fine flavoured varieties as Warrington, Ironmonger, White Champagne, Venus, Cheshire Lass, Yellow Golden Ball, and others had to give way to huge tasteless things. Mr. George Monro stated that probably the British public was responsible for a good deal of this, and while big things sold well he supposed the growers would cater for it. Many other members took part in the discussion, which was of a very interesting character, and a vote of thanks was cordially given to Mr. Wilks for his address.

WOOLTON GARDENERS' SOCIETY.

A MEETING of this society was held on the 15th inst. at the Mechanics' Institute, Mr. W. Tunnington presiding over a good attendance of members. Mr. J. Hathaway, superintendent of the Southport Parks and Gardens, gave an able paper on "Potting and Watering Plants." The various forms of peat, loam, leaf-mould, sand, &c., were described, and the various mixtures that formed suitable composts for the different species of plants. The necessity of clean pots and good drainage were urged as the requirements of importance. In repotting special notice should be taken that the ball of soil in which the plant was growing should at the time of the operation be of a medium state as to moisture, neither dry nor wet. Firm potting was recommended, especially for hard wooded plants, such as Azalea indica, ericas, epacris, &c. Watering was considered a most important function in good cultivation, a detail that could not be taught but learnt by practice. Rain water should be utilised if possible, and of a similar temperature to the surroundings. Care should be taken only to water when the plant requires it, generally when the plant is on the side of dryness, but not when flagging or suffering. A discussion followed, in which several points of interest and usefulness were added by Messrs. R. Todd, T. Carling, J. Wilson, J. Hogan, and the Chairman. A vote of thanks was tendered to Mr. Hathaway for his admirable essay, and to Mr. Tunnington for presiding.

SHIRLEY GARDENERS' ASSOCIATION.

THE monthly meeting of the above society was held at the Parish Room, Shirley, Southampton, on Monday, the 19th inst., Mr. W. F. Rummens, C.C., presiding over a good attendance of the members. The lecture was a continuation from the previous month, the subject being "The Soil," and was given by Mr. E. T. Mellor, B.Sc. London, lecturer in Biology at the Hartley College, Southampton. A brief synopsis of the lecture was as follows: Relation of the soil to plants, chemical changes in the soil, loss and replacement of nutritive substances in the soil. The lecture was most interesting and instructive, being most profusely illustrated with lantern slides and chemical experiments. There was a brief discussion, at the close of which a hearty vote of thanks was accorded to Mr. Mellor for the two instructive lectures he had so kindly given. Messrs. Spooner and Bailey, of Ealing, Southampton, gave the members a cordial invitation to visit their chemical factory, where many interesting processes of producing chemical manures are carried out.

Packing Eggs.—There is evidently room for improvement in packing Irish eggs for the English markets, for Messrs. Lowen and Rolfe, agents for the Manchester and Dublin Steamship Company, have made up their minds that it will not pay them to continue carrying eggs from Dublin to Manchester under present conditions. They say: "We have not come to our conclusions hastily. We have practically the whole of 1898 to work upon, and our experience is that it will be better for us to refuse the traffic and let our competitors take it on whatever terms they like. We have kept a record of the quantity of eggs we have carried and the claims we have paid, and the result is appalling. When we say it will pay us better under present conditions to refuse the traffic we speak as strongly as we can. We are anxious to do all we can to prove to the trade that the breakage and pilferage do not take place whilst in our custody; if they do we are prepared to pay for them. The senders sign owner's risk notes when they hand the eggs to the railway company in Ireland, who carry them to Dublin The railway company will not carry them until they get these notes. In due course the eggs reach Manchester, and, as the last people to handle them, we fall in for all the trouble." Messrs. Lowen and Rolfe recommend that two inspectors should be appointed to examine the eggs at Dublin. This proposal, which would involve an annual expenditure of about £300, has been under the consideration of the Manchester Provision Merchants' Ship Canal committee, but no definite step has as yet been taken. It certainly does seem curious that eggs should be able to reach Manchester from remoter parts like Denmark with only nominal damages, and that the Dublin traffic should result in Messrs. Lowen and Rolfe receiving claims for damage which are in excess of the net freight. It would be interesting to know who is responsible for breakages, and also for the serious handicap to industry which these breakages involve.

NEW BOOKS.

Insects Injurious to Orchard and Bush Fruits. By ELEANOR A. ORMEROD. (Simpkin, Marshall, Hamilton, and Co., Stationers' Hall Court, E C. Price 3s. 6d.)—Another most invaluable work has just issued from the pen of the talented entomologist Miss E. A. Ormerod, and deals with insects injurious to orchard and bush fruits and the best means of prevention and remedy. It consists of 280 pages brimming over with valuable information to the fruit grower, and contains as a frontispiece a photo likeness of the author, with sixty other illustrations. In the preface the author states that she has endeavoured to collect into a convenient form for reference the most important points of information which we possess regarding the life-histories and habits of the insects of which the attacks are commonly injurious to a serious extent to hardy fruit in this country, together with notes of methods of prevention and remedy which have been found serviceable at a paying rate. Some of the attacks mentioned have long been known of, but there are few if any of these of which we have not gained some additional information during the past few years, and of many of the others we have only lately become possessed of the whole life-history; whilst others, again, have lately shown themselves as perfect scourges (in our present large scale of fruit growing) which even within the last four or five years were wholly unknown to us as fruit pests.

Some of the infestations which have been little (or not at all) known of as injurious until the past few years—as, for instance, the attacks of the Flat-celled Shot-borer Beetles in plum wood, those of the "ground beetles" to strawberry fruit, or again of the eelworm, which causes distorted growth of the strawberry plant, have been entered into at considerable length, so as to give as much detail as possible. In addition to the accounts of damage by insect attacks, observations are also given of a few other kinds of infestations, such as injuries by phytoptidæ or gall mites, and nematoid worms; and also, and very especially, the infestation known as rust or red spider, of which more information was much needed where it could be attainable for general reference. The author states that, as far as her experience shows, the protection of our fruit crops from insect ravages is likely to be an increasing difficulty, consequent on the increasing extent of the areas in which one kind of orchard tree or fruit bush is grown year after year, thus giving every opportunity for the established settlement of the insect feeders on that special crop. The handbook is worthy of careful study by every fruit grower, and deserves a place in the library of every horticulturist.

Pansies, Violas, and Violets. By WILLIAM CUTHBERTSON, F.R.H.S. (Macmillan and Co., Limited, London.) Price 1s.—Although a somewhat restricted view is taken in dealing with the violas, Mr. Cuthbertson has been successful in producing a handbook that will be highly appreciated by those who take a special interest in the three classes of flowers which form the title, and should be useful to all who are engaged in flower-garden management. In the admirably written introduction the author gives an historical sketch of the development of the show and fancy pansies, and of the race of violas which now receive so much attention from amateurs, and are so largely employed in the embellishment of the flower garden. As so well known to those who have studied the literature of the pansy, the initial improvement of this flower is chiefly due to Lord Gambier and his gardener, Mr. Thompson, who commenced the work of improvement by selection from the seedlings of the common heartsease, which Lord Gambier had asked him to cultivate, and by intercrossing the wild form with a blue variety obtained from Brown, of Slough, and a dark one from Russia. The full account of this early attempt to improve the pansy, written by Thompson in 1840, is given and is extremely interesting reading. Thompson states that four years after he had begun to raise seedlings he became much interested with the work, and as Lord Gambier was much pleased with the results he persevered. One of the most beautiful of the varieties was Lady Gambier, and Thompson states that although the flowers were in shape "little more symmetrical than a child's windmill," it "won golden opinions from every beholder." In 1862 it was suggested that the show pansy had nearly run its course, and with reference to this the author observes that that writer "did not foresee that the show pansy was to maintain a firm hold on the tastes of British florists for nearly twenty years longer." This fact is satisfactory so far as it goes, but it is not pleasant to think that show pansies with their finely marked flowers have now practically become things of the past. We have no explanation given with regard to their disappearance from gardens, notwithstanding the fact that the point is of some importance. The development of the fancy pansy, and the race of violas, which now obtains so much attention, undoubtedly had something to do with the decline in the popularity of the show pansy, but the chief cause was unquestionably the want of vigour in the plants. The raisers of pansies, as of show pelargoniums, were so intent upon the shape and markings of the flowers as to have lost sight of the fact that finely-formed flowers are of but little value unless the plant has a constitution sufficiently strong to produce them with some degree of freedom. Many of the later varieties of the show pansy had so weakly a constitution that it was a work of extreme difficulty, except in favoured districts, to maintain them in a healthy condition, and in consequence cultivators became tired of the difficulties they had to contend with in their cultivation. These facts cannot be brought too prominently before the raisers of pansies and violas, and we should therefore have been pleased to see some reference to them in the pages of this excellent manual.

The historical sketch of the development of the fancy pansy and the race of violas is in some respects less interesting than is that of the show pansy, but that is in some respect due to their development having been accomplished within a comparatively recent period. If apparently of less interest than is that of the older section, it is not less brightly written, nor is it less useful. Mr. Cuthbertson traces with remarkable clearness the development of these two classes, and accompanying the sketch are admirable illustrations of the several types, and excellent portraits of the raisers who have specially distinguished themselves. Following the historical introduction is a chapter on the botany of the three classes of flowers written by Mr. John Ballantyne, and this should prove extremely useful to the practical cultivator as well as to the botanical student. In other chapters the cultivation of pansies and violas for exhibition, and for flower garden decoration, and of sweet violets for the supply of cut flowers, is fully dealt with, and carefully prepared selections adapted to the several purposes are given. Nor has the literature of the violet in its several forms been overlooked, for as a balance to the immense amount of cultural and historical information contained in the well-filled pages we have a chapter in which the poetry of the violet is discussed with singular ability. A chapter on the several beautiful species of viola known to thrive in British gardens would have added materially to the usefulness of the work, which is so valuable to warrant it having a place in the most select garden library.

Educational Leaflets. Part II. Edited by H. E. DRESSER, F.L.S. (Society for the Protection of Birds, 326, High Holborn.) Price 1s.—This part of the Educational Leaflets, issued by the Society for the Protection of Birds, contains ful particulars of the appearance, food, and general habits of the terns, wagtails chough, jay, flycatchers, nightingales, gulls, leaf-warblers, skylarks, skuas, pipits, grebes, and the common buzzard. Information relating to the protection of these birds is given, and the description of each species is accompanied by a characteristic illustration. In his general remarks on the last-named bird the Rev. H. A. H. Macpherson points out the importance of protecting birds of prey. He writes:—

The protection of the larger birds of prey can rarely be secured, except through the forbearance of those who, as large owners of land, are most keenly interested in preserving game. The sportsman who pays exorbitant rates upon the supposed sporting value of his estate, and who has further to prevent his game from being exterminated by maintaining a costly staff of keepers and watchers, has it greatly in his power to decide whether the buzzard and other rapacious birds should be allowed to increase and multiply upon his estate. If, then, it could be proved that the buzzard habitually destroyed game, reason is that we should throw up the brief which we hold for its defence. But happily the buzzard does not destroy game; on the contrary, all our experience goes to prove the facts laid bare in the stomachs of the buzzards which we have personally dissected (there is all the difference in the world between the mere compiler and the man who writes from a wide knowledge of substantial facts), that the buzzard lives on small but harmful mammals, and on carrion. Of course the buzzard kills rabbits, principally small ones, when it can get them; but this is in its favour. Rabbits do immense harm to sheep pasture, not only because they eat a quantity of grass during the spring months when food is scarce, but also by defiling the pasturage, which sheep refuse to eat in consequence. The short-tailed fieldmouse or vole is most injurious to hill pastures, and would multiply enormously were it not for the exertions of buzzards, kestrels, and owls. The buzzard is a friend to the farmer, and well worth encouraging on that score. But there is yet another reason why the hand of the destroyer should be arrested before he fixes the iron gin to trap the harmless and useful buzzard. Much of our wildest and most beautiful scenery would seem cold and lifeless were it not for the presence of the shy creatures which, driven from more sheltered asylums, seek to continue their race among beetling scaurs and desolate uplands. The buzzard—where does she nestle upon her prettily-blotched eggs? Far away among the shadows of the pathless hills, where the muirfowl crows unheeded, where the red deer hinds file along the mountain side, and the fox creeps through the loose screes, intent upon surprising the blue hare that crouches in the heather in short-lived security. The male buzzard sweeps through the adjacent strath, or challenges his mate to soar aloft in his company, circling round with the least possible expenditure of exertion. When one of a pair is killed, the survivor wails in loneliness among the passes of the hills until time heals its sorrow by providing a new mate. Day after day the freshly-united couple may be seen hunting in company, but they will most likely defer further nesting plans to another spring. If they succeed in escaping the tender attentions of the inveterate egg-collector, you may enjoy the evolutions of the whole family, until the approach of autumn tempts the young birds to wander to fresh districts. But the old birds will remain year after year in their accustomed haunts, nesting in one or other of their ancestral eyries; and at other times coming in to roost just before dusk in their favourite niches among the crags. A wild, free life is that of the buzzard, ever gliding through the air in easy circles, or poised upon the projecting pinnacle of some sea-washed precipice. Why should the charm of its fine presence be withdrawn from the mountain or the lonely island shore, seeing that it is harmless to game, and a friend to the hard-pressed agriculturist? Game preserves have nothing to gain by effecting or permitting its extermination. The world is the poorer for every buzzard that yields up its innocent life in the keeper's trap.

How fully the utility of the buzzard is understood in Germany is evidenced by the title it bears, "Der Mäuse Bussard": *anglice*, the Mouse Bussard.

The Buying and Home Testing of Seeds. By WILLIAM TOOGOOD. (Toogood and Sons, Southampton.)—In an admirably prepared brochure of sixteen pages Mr. Toogood gives much useful information on the purchase and testing of the purity and germinating power of different classes of seeds. Numerous illustrations are given of the apparatus used in the germination of seed, and the results obtained, and these will be found useful in the elucidation of the text.

Cucumber Culture. (G. Tucker, 1, 2, and 3, Salisbury Court, Fleet Street.) Price 2d.—A pamphlet of some thirty pages, in which useful information on the cultivation of cucumbers for market and home use is given.

MARKETS.

Covent Garden.

THERE are abundant supplies of fruits and vegetables. Oranges, grapes, apples, and nuts sell readily, and the potato trade is fairly good, and the cut flower trade brisk.

FRUIT.—English apples, 3s. to 8s. per bushel; Nova Scotian and Canadian, 12s. to 22s. per barrel; Californian, 8s. to 9s. per case; French pears, 3s. to 5s. per case; Californian, 4s. to 7s. per half-case; English grapes, 10d. to 1s. 9d.; Channel Islands, 6d. to 1s. per lb.; Almeria, 10s. to 18s. per barrel; Jaffa oranges, 8s. to 10s. per box; Valencia, 8s. to 16s.; Murcia, 6s. to 6s. 6d. per case; pineapples, 1s. 6d. to 4s. 6d. each; bananas, 4s. to 9s. per bunch; lemons, 8s. to 16s. per case; English tomatos, 6s. per 12 lb.; Bordeaux, 1s. 6d. to 2s. per box.

FLOWERS.—Arums, 9s. to 12s.; carnations, 2s. to 3s.; chrysanthemums, white, 6s. to 9s.; chrysanthemums, yellow, 4s. to 6s.; eucharis, 4s. to 6s.; gardenias, 2s. to 3s.; Lilium Harrisi, 9s. to 12s.; tea roses, 1s. to 2s.; pink roses, 4s. to 6s.; cattleyas, 10s. to 12s.; Odontoglossum crispum, 4s. to 6s.; poinsettias, 12s. to 15s.; and tube-roses, 3d. to 9d. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; chrysanthemums, 6s. to 9s.; marguerites, 6s. to 9s.; pelargoniums (scarlet), 12s. to 15s. per dozen bunches; lily of the valley, 1s. to 2s.; Roman hyacinths, 1s. to 1s. 6d.; azalea indica, white, 1s. to 1s. 3d. per dozen sprays; and bouvardias, 4d. to 6d. per bunch.

VEGETABLES.—English onions, 5s. to 5s. 6d. per cwt.; Valencia, 6s. per case; Dutch, 3s. 3d. to 3s. 9d. per bag; eschallots, 8s. to 10s. per cwt.; cucumbers, 2s. 6d. to 4s. 6d.; endive, 1s. 3d. to 1s. 9d.; lettuce, 9d. to 1s.; cos, 2s. to 2s. 6d. per dozen; cabbages, 3s. 6d. to 6s.; cauliflowers, 6s. to 9s. per tally; celery, 5s. to 12s. per dozen rolls; Brussels sprouts, 2s. 6d. to 3s. per half-sieve; spinach, 2s. to 2s. 6d. per bushel; seakale, 9d. to 1s. per punnet; mushrooms, 5s. to 8s.; garlic, 3s. per 12 lb.

Borough Potato Market.

There is a moderate trade, and a slight rise in the rates for the majority of the varieties. Scottish Abundance, Bruce, and Main Crop, 65s. to 75s.; Beauty of Hebron, Snowdrop, and Up to Date, 70s. to 75s.; White Hebron, Early Puritan, Bruce Magnum, Sutton's Early Regent, Reading Giant, and Imperator, 65s. to 70s.; Blacklands, 60s. per ton; Germans, 2s. 6d. per bag.

MESSRS. JAMES CARTER AND CO. inform us that their establishment will be closed from two o'clock to-day (Saturday) until nine o'clock on Wednesday morning next.

ANSWERS TO CORRESPONDENTS

Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, &c., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning change of dates.

Croton Van Œsterzi.—E. E. P., Tottenham: This isa stove plant, and probably has not been afforded sufficient heat; consequently the leaves are falling. Excessive drought would also bring about a similar result.

Sanitary Pipes for Heating Purposes.—E., Lincoln: The pipes would not do for hot water heating, as they would not be able to resist high pressure. Large pipes may be used for heating if joined as a flue to the furnace. This method is adopted at the Quessy Forceries illustrated in the present issue.

Packing Material.—K.B.: The best material for packing fruits is wood wool made from white wood. It is far superior to cotton wool and much cheaper. You can obtain it from any of the horticultural sundriesmen, and through the majority of the nurserymen who advertise in the pages of the GARDENERS' MAGAZINE.

Brier Seed.—Hip-Berry, Leicester: Gather the hips and place them in a box or large flower pot with dry sand between each layer. They may remain in the sand until March, when the seed should be rubbed out in the sand. Sow the seed thinly in shallow drills about twelve inches apart and keep the intervening spaces free from weeds, and thin the briers where much crowded.

New Chrysanthemum.—A. F., Huddersfield: The sport is very distinct from the parent, and with special culture should produce useful exhibition blooms. The name "Nortonthorpe" is suitable. The best way to test the variety will be to cultivate it for exhibition and send blooms to the N.C.S. and R.H.S. next November.

Backwall of Vinery.—Provided the vines fill up their allotted space you should be satisfied with a crop of grapes and leave the backwall bare. If during full leafage plenty of light reaches the wall, then other vines or tomatos might be planted against it. We expect all correspondents to send name and address with their questions.

Mushrooms and Insects.—Worthing: We find no insects in the small box of soil and embryo mushrooms sent. It is very probable, however, that woodlice and slugs are the offenders, and these must be trapped by means of dry moss, cabbage leaves, hollowed potatos, &c. If you can find the haunts of woodlice boiling water will soon rid you of the pest. A little careful hunting and watching should remove the evil.

Prize Chrysanthemums.—R. Rogers, Stexted Hall: We greatly appreciate your kindness in sending a photograph of the magnificent stand of chrysanthemums for which you were awarded the piece of plate offered by the Mayor of Colchester for the best stand of twelve blooms. The photograph is, however, hardly suitable for reproduction, and would fail to do the blooms justice. We are at all times pleased to receive photographs of objects likely to interest our readers.

Violets Damping.—J. K., Northants: The moist, warm weather of autumn has tended to produce damping of violet foliage wherever the plants have had anything less than exceptional care taken of them. Where the plants have produced large quantities of foliage damping has, in some instances we have noticed, obtained a hold before the grower knew damage was done. Violets in frames need frequent examination and the removal of all decaying foliage and stems, in addition to careful watering and abundance of air on all favourable occasions.

Zonal Pelargoniums in Winter.—F. H.: There is no special race of winter flowering zonal pelargoniums, but the varieties differ somewhat in freedom of flowering during the winter months. One of the chief points is to have young plants nicely established in five or six inch pots at the end of September that have not been exhausted by flowering. Another point of importance is to place them in a medium-sized house where they can have a position near the glass, enjoy uninterrupted light, and have the assistance of a temperature of about 50 degrees. A dry atmosphere and moderate ventilation are also essential to success.

Grapes for Exhibition.—G. F. B., Salop: The suitability of the several varieties for exhibition purposes depends to a material extent upon the season of the year in which you wish to show them. If you have but one division in the house you purpose planting we would suggest that you substitute Alicante for Madresfield Court. It is not so highly flavoured, but it is more easily grown to a high degree of perfection, and is more suitable for associating with Gros Colmar. It should have a place at the cool end of the structure, as it does not require so high a temperature as the other varieties.

Diseased Kales.—W. S.: The disease which has so greatly damaged your crop of kales is known as club root, and is caused by a slime fungus, *Plasmodiophora brassicæ*. You can do nothing to improve the condition of the crop, and we would suggest that it be used as quickly as possible, and the ground receive a dressing of gas lime at the rate of two tons per acre. Spread the lime over the surface and allow it to remain for at least three weeks before digging it in. As the spores retain their vitality in the soil for at least two years, the ground should not be cropped with kales, cabbages, cauliflowers, or broccoli for at least three years. The stumps should be either dug in or burnt on the ground and the ashes dug in, for when they are taken to the rubbish heap they decay and the spores become mixed with the materials forming the heap, and when the latter is wheeled out the ground to which it is applied becomes infected with the fungus.

Gardeners' Royal Benevolent Institution.—G. F. B.: There is no formality with regard to membership of this charity, and if you inform Mr. G. J. Ingram, the secretary, whose address is 175, Victoria Street, S.W., that you desire to become a member he will at once add your name to the list. The annual subscription is one guinea, and it will be advisable to send that sum with your application.

Heavy Soil.—T. G. O.: It may be that much of the difficulty you have experienced in dealing with the heavy soil is due to your having brought the bottom spit to the top in trenching. It is desirable to break clay soils up to as great a depth as possible, but that should be accomplished by the course of procedure technically known as bastard trenching. In breaking up the soil by this method a trench is opened out in the usual way to a depth of twelve inches and the soil is put on one side. The bottom of the trench is then forked over to a depth of eight or ten inches, and the soil is well broken but allowed to remain in the trench. When this has been done the soil from the second trench is turned over into the first trench and the bottom spit broken up by the fork as in the first trench. This process is repeated until the whole of the quarter has been dug over, when the soil removed from the first trench is used for filling the last one, precisely as in the case of ordinary trenching. When, as sometimes happens, heavy soil is trenched over and the subsoil is brought to the surface the difficulty of cultivation is materially increased for several years, as a considerable period elapses before a stubborn clay becomes sufficiently ameliorated by atmospheric influences and good cultivation to admit of its being readily worked, and the roots extending freely through it. Liberal dressings of newly slaked lime will be highly beneficial, and surface soil of vacant quarters should be left in a rough state during the winter. It is also an excellent practice to throw the soil up into ridges for the winter for the purpose of exposing it more fully to the action of frosts.

Names of Plants.—E. E. P., Tottenham: Croton Van Œsterzi.

C. M., Liverpool: 1, a poor form of Cypripedium insigne; 2, Oncidium varicosum Rogersi; 3, O. tigrinum.

M. E.: 1, Dracæna congesta; 2, not recognised; 3, Hoya carnosa; 4, Platyerium alcicorne; 5, an oleander, send a flower.

P. W., Worcester: 1, Eranthemum Andersonianum; 2, Linum trigynum; 3, Euphorbia splendens.

A. L. S., Wellingborough: 1, Sciadopitys verticillata; 2, Osmanthus illicifolius; 3, Jasminum nudiflorum; 4, Swainsonia galegifolia; 5, Erica hyemalis.

B. J. G., Hemel Hempstead: 1, Retinospora plumosa; 2, Hedera dentata; 3, Eurya latifolia variegata.

Names of Fruits.—F. D., Ilfracombe: Wyken Pippin.

M. R., Mitcham: 1, Beurré Bachelier; 2, Maréchal Vaillant; 3, Nouvelle Fulvie; 4, Glou Morceau.

T. R. C., Caterham: 1, Nec Plus Meuris; 2, Fearn's Pippin; 3, King of the Pippins; 4, Blenheim Pippin.

H. H., Birmingham: 1, Jean de Witte; 2, Beurré d'Aremberg; 3, Winter Nelis; 4, not recognised.

The mean reading of the Barometer during the week at Greenwich was 30·12 inches, and that of the Thermometer 48°·0, the latter being 7°·9 above the week's average in the 50 years 1841—90. The direction of the wind was south-westerly, the horizontal movement of the air being 8 per cent. above the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 0·8 hours. No rain was measured during the week.

ENGAGEMENTS FOR THE ENSUING WEEK.

AUCTIONS.

THURSDAY, DECEMBER 29.—Azaleas, Rhododendrons, Carnations, &c., Messrs. Protheroe and Morris's Rooms, Cheapside, E.C.

A GRAND SPECULATION, in these days of financial unrest, is a rare thing for people with spare capital to come across. It is, therefore, refreshing to know that in purchasing a box of Holloway's Pills good value for money can be obtained. They never fail to give instant relief from pain, and no disease can long withstand their purifying influence: A few appropriate doses at the proper period will prevent many a serious illness. Their primary action is upon the blood, stomach, liver, kidneys and bowels. Their secondary action strengthens the nervous centres. No drug can be so harmless yet so antagonistic to disorders caused by brain worry. The most perfect reliance may be placed upon their regulating and renovating virtues.—[ADVT.].

Situations Wanted.

Advertisements under this heading are charged 1s. each, four lines (32 words), and 3d. per line after. A Copy of the "Gardeners' Magazine," Post Free, 2½d.

THREE INSERTIONS FOR THE PRICE OF TWO!

GARDENER (Head Working).—Age 24; married when suited; experienced in all branches.—Apply E. MAY, The Gardens, Hillingdon House, Uxbridge.

GARDENER (Head Working); age 35; married; thoroughly experienced all branches, including orchids, early and late forcing; excellent references.—DYMOND, Birchwood Grange, Pen-y-lan, Cardiff.

GARDENER (Head Working); age 38; married.—Gentleman strongly recommends his Head Gardener, where about six are kept; thoroughly practical in all branches; 5 years in present situation as Head; life experience.—E. J. JOHNSTONE, Esq., Rougham Hall, Bury St. Edmunds.

GARDENER.—Wanted, SITUATION as Single handed, or where help is given; 12 years' experience with Glass and Outside Work; married; no family; good character from both past and present places.—HAYDEN, 2, Bank Cottage, Wilton Road, Shanklin, I.W.

GARDENER (Second) requires SITUATION where four or five are kept; 10 years' experience Inside and Out; good references; age 25.—Address H. HOLBROOK. St. Julians, Sevenoaks, Kent.

HEAD GARDENER.—R. C. Sanders, Halton Gardens, Tring, can highly RECOMMEND his Foreman and Decorator as a competent and trustworthy man; 16 years' experience in Plants, Fruit, and Vegetables; also Tree Lifting, Planting, General Ground Work and management of men; age 31.

RICHARD SMITH and CO., beg to announce that they are constantly receiving applications from Gardeners seeking Situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

WANTED, SITUATION as Shopman by Young Man; seven years in the trade; Nurseries, Seed, and Shop; good references.—Apply J. E. REYNOLDS, Guildford House, Harrogate.

T. PAGE, Esq., would highly recommend his HEAD WORKING GARDENER, who has been with him seven years, to any Lady or Gentleman requiring the services of a thoroughly practical man, where three or four are kept; life experience in good establishments; age 34; married.—Address WILLIAM ALLUM, Trevissome, Falmouth. Land and Stock if desired.

Situations Vacant.

GARDENER.—Handy Man Wanted, married; cow and horse kept; help given.—Apply J. S., 9, Salisbury Road, High Barnet.

SECRETARY WANTED by the Committee of the Royal Gardeners' Orphan Fund; Salary, £100 per annum. Applications to be sent in not later than Thursday, January 12th, accompanied by not more than two testimonials of recent date.—Address the SECRETARY, Royal Gardeners' Orphan Fund, Chiswick, London.

IMPORTANT NOTICE.

AN EMPLOYMENT REGISTRY DEPARTMENT IS CONDUCTED IN CONNEXION WITH THE "GARDENERS' MAGAZINE," AND THE CHARGE FOR AN ADVERTISEMENT ***INCLUDES A FREE ENTRY ON THE REGISTER FOR ONE MONTH.*** IF NOT SUITED AT THE END OF THAT TIME, AND IT IS DESIRED THAT A NAME SHOULD REMAIN, IT WILL BE CONTINUED FOR A FURTHER PERIOD UPON RECEIPT OF A REQUEST. IMMEDIATE NOTICE MUST BE GIVEN WHEN AN ENGAGEMENT IS SECURED.

A List of Gardeners on the Register will be supplied upon application to the Publishers if a stamped envelope is forwarded, addressed 148 and 149, Aldersgate Street, London, E.C.

HORTICULTURAL CORRESPONDENCE CLASSES.—For PROSPECTUS and LIST of PRIZES apply T. H. SMITH, 18, Somerville Road, Small Heath, Birmingham. First Examination Paper ready November 5. Join early for the whole course.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at One Shilling per line, the minimum charge being Five Shillings. Advertisement Office, 148 and 149, Aldersgate Street, London, E.C.

NOTICE TO ADVERTISERS.

Owing to continued increase in circulation, the "Gardeners' Magazine" now goes to press on Wednesday. No advertisement can be guaranteed insertion, or altered, unless received before Four p.m. on that day.

NOTES OF THE WEEK.

THE PAST YEAR.

THE year which has now so nearly run its course that it may with propriety be spoken of in the past tense cannot be regarded otherwise than with mixed feelings by those engaged in horticultural pursuits. It has had associated with it many disappointments and not a few difficulties, and, as a counterbalance, it has given the cultivator much that justifies a feeling of satisfaction with the past and a spirit of hopefulness for the future. Chief among the difficulties that have had to be contended with are those due to our fickle climate, which, in its changeful mood, has been less favourably inclined to the practical horticulturist than in some previous years, without the weather being such as to bring about results more or less disastrous. An exceptionally mild winter, remarkable for its small rainfall, was followed by a cold spring, which greatly retarded vegetation of all descriptions, and so materially reduced the crop of the more important hardy fruits as to inflict heavy losses upon the majority of those engaged in the production of market supplies. This was all the more disappointing from the fact that the thorough ripening of the wood and the perfect maturation of the flower buds, as the result of the splendid weather that was experienced in the autumn of 1897, fully justified the expectation of crops considerably above the average. Green crops of the garden varied considerably in different districts according to the amount of rainfall, but throughout May and June the progress made was very slow, and over a wide area they suffered severely from the prolonged drought that commenced about the middle of July. Potatos, happily, although yielding light crops in many districts, have been distinctly more satisfactory than in the previous year, and we are consequently less dependent upon foreign supplies than was the case at the close of 1897. The business aspect of horticulture appears to have been eminently satisfactory, for we have had evidence of much activity in both the nursery and seed trades, and have heard but little grumbling except of the difficulty experienced in commencing in the autumn the execution of orders for trees, shrubs, and plants from the open ground in consequence of the dryness of the soil. Exhibitions of the leading societies have, we are pleased to state, been well maintained, and we have had in the course of the year to record gatherings of exceptional excellence in the Temple Gardens and at the Crystal Palace under the auspices of the Royal Horticultural Society; and at Edinburgh, Shrewsbury, York, and other provincial centres. The special societies associated with floriculture have achieved much success, a fact deserving of special attention, inasmuch as it proves to demonstration an unabated interest in the more important florists' flowers. Very successful also have been the fortnightly meetings of the Royal Horticultural Society, which has had a larger accession of new Fellows than in any year since it left South Kensington. Gardening charities have been liberally supported, but as yet the income of the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund is far below the necessities of these two admirable charities; and, anticipating the many disappointments that must follow the elections to be held in January and February next, we express the hope that they will receive still more generous support in the coming year. Of ourselves we shall speak but briefly; we have to acknowledge generous help from a large and increasing band of contributors, and to express our satisfaction with the continuous and rapid increase in the number of our readers. Stimulated by the success that we have achieved during the past year and the knowledge that horticulturists are quick to appreciate enterprise and well-directed efforts on their behalf, we shall enter on the new year with the full assurance of their support in continuing the vigorous policy that has placed the GARDENERS' MAGAZINE in the forefront of horticultural journalism.

THE SPECIAL FLORICULTURAL SOCIETIES.

THE special floricultural societies whose headquarters are in the metropolis appear to be flourishing, judging from the nature of the reports presented at the various annual meetings held during the past week or two. The National Rose and the National Dahlia Societies led the way, and it is satisfactory to know that in each case there is a very substantial augmentation of the balance in hand, while the reports of the committee in either case were highly satisfactory. Both societies afford conclusive evidence that the act of receiving subsidies from a public institution like the Crystal Palace is a commendable policy, and they can be accepted without loss of independence and self-government. The National Rose Society is doing its work in its own way with conspicuous success, and, despite the rivalry of other popular flowers, its admirers can still hold aloft with pride the ardent wish they express in their motto, "Floreat Regina Florum." It is intended during the coming year to revise and issue a new edition of the society's catalogue. The National Dahlia Society have no reason for despondency, for though the subscription list is somewhat limited in extent there is no doubt that the culture of the dahlia as an exhibition flower is steadily on the increase. It was the introduction of the cactus type which imparted vigour to the culture of the dahlia in this country. The National Carnation and Picotee Society shows a remarkable advance during the last few years. It has been singularly fortunate in having a wealthy enthusiast like Mr. Martin R. Smith as its president and leader, and he has spared neither time, means, nor enthusiasm in promoting the success of the society. His achievements as a raiser have revolutionised the carnation. He has multiplied the self and fancy types by producing varieties of the highest quality. No contemporary raiser has touched the high water mark of production as Mr. Smith has, and it is gratifying to know that he has seedling bizarred and flaked carnations and white ground picotees which rival in quality his glorious selfs and fancies. We think not a few of the flowers annually exhibited in competition for the prizes offered are unworthy the awards made, but it must be mentioned it is very difficult to originate new lines upon which to show carnations. As a border flower and for blooming all the year round it has a wide reputation. Mr. Douglas's plea for a more austere recognition of the yellow ground picotee is to be commended. We want to see the properties of the white ground picotees demanded in the case of the yellow ground varieties. It is said some latitude must be allowed the judges, because the really good varieties are few; but we hold there is sufficient material to make a beginning with. Even the National Auricula and Primula Society is on the upward grade, though there are fewer cultivators of the auricula than of the popular rose, carnation, and dahlia. We note with satisfaction that the old type of gold-laced polyanthus is restored to the schedule, as this will probably be the means of keeping in existence a form of polyanthus dear to many old florists, and one extremely difficult to obtain of a high order of merit as seedlings. We can heartily congratulate the special societies on their activity and success in the past year, and desire for them a still larger measure of each in the year just opening before them.

THE SHORTEST DAY.

ONCE again the whirligig of time has brought us in this northern hemisphere past the lowest ebb of the annual tide of sunshine, and once again we are cheered by the reflection that with this turn of the tide every day will be adding a little to the floral activity in which we horticulturists delight, and of which the sunshine is literally the life and soul. Spring, it is true, is yet in the far distance, and in this climate of ours the rigours of winter are usually experienced far more severely in the first months of the year than in the last, for the simple reason that just as the hottest period of the summer succeeds the longest day, owing to the accumulation of the sun heat, so the bleakest time of the year succeeds the shortest day, due to accumulated cold. Nevertheless, despite the hard weather we may reasonably and seasonably anticipate, we hail the passing of the shortest day and longest night with a feeling of gratification that the change has commenced which will inevitably bring in its train first the bright crocus, with its golden chalices; the hepatica, with its azure stars; and then all the bright array of scillas, tulips, and their tribe to follow. It is a curious fact to reflect that coincident with our long nights and brief daylight our Antipodean cousins are in full enjoyment of midsummer and precisely reverse conditions, and that this difference is all due to our globe being spun round on the slant instead of, like a top, in an upright position as regards the sun. Had matters been so arranged when this little world of ours was started every spot on the world's surface would have had precisely twelve hours all the year round between sunrise and sunset, the seasons would have been non-existent, and beyond a doubt the forms of life, especially plant life, would have been very differently modified. The equatorial regions would have been much as they are now, since equal day and night is there established by their central position, but northward and southward an even and general diminution of temperature would have obtained, culminating in presumably Polar ice and snow owing to the obliquity of the sunshine they would get. In our island a perpetual spring would be our lot—an everlasting equinox; but certainly that spring would be devoid of all the charm of rejuvenescence which we now enjoy, and the vegetation, robbed of the hot summer sun on the one hand and unchecked by keen winter frosts on the other, would fit into no types with which we are acquainted, since no such permanently stable conditions exist on our planet to have moulded them. The poet may rave about perpetual spring, just as the gastronomist might dream of a perpetual dinner, but it is the winter fast which creates the necessary appetite, and in our opinion we have much to be thankful for when we consider what an unutterable monotony has been spared to us by that little twist our whirling planet received when launched into space as an independent world.

Manurial Experiments in not a few instances fail to have any practical value in consequence of those engaged in them failing to recognise the importance of conducting them on land that is indifferently stored with plant food. In a report on some experiments carried out during the current year in the use of fertilisers for potatos it is stated that the unmanured or control plots produced crops equal to eleven tons per acre. Land so richly stored with plant food as to be able to produce such large crops as these was of but little value for purposes of experiment, as very heavy dressings of artificial or natural manures would be necessary to produce any appreciable influence upon the yield. It cannot be too distinctly understood that the land should be decidedly poor and uniform in quality throughout for experiments that are to have general application, for, unless this be the case, the results can have but little value, if they are not actually misleading. In the experimental use of manures in the garden for the information of individual cultivators it is not necessary to carry them out on exhausted soil, as all that is necessary is to vary the dressings applied to certain crops, and carefully note the results. These will be useful for the guidance of the cultivator in the garden in which the experiments were made, but of comparatively little use to others. We are in great need of systematic experiments carried out under the direction of a central organisation on the lines suggested by Mr. George Gordon in his lecture before the Royal Horticultural Society in October last.

Then and Now.—It is worthy of note, writes Mr. R. Dean, that the first chrysanthemum show that was held at the Crystal Palace took place in 1858, in the month of November, but the chronicler does not give the date. The late Mr. A. Wortley was first with twenty-four blooms, and it may interest some to have the names: Yellow Formosum, Themis, Leon Leguay, Annie Salter, Formosum, Raymond, Nonpareil, Rosa Mystica, Astrea, Christopher Colomb, Virgil, Pio Nono, Antigone, Dupont de l'Eure, Madame Le Corde, Madame Andre, Pluto, Hermione, Stellaris globosa, Madame Miellez, Madame Nolleville, Aregina, Aimée Ferriere, and Queen of England. Nearly the whole of these names can be found in the centenary edition of the National Chrysanthemum Society's catalogue, 1890, though not a few of them by that time must have gone out of cultivation; but their inclusion at that period bore testimony to the industry of the Catalogue Committee, who did their very best to give a complete list of the named chrysanthemums to that date. Only one, the perennial Queen of England, which was distributed by John Salter just half a century ago, but which is but little seen at the present time, was exhibited in 1858. Arthur Wortley lived to see the splendid development of the incurved and Japanese sections up to the Jubilee celebration of 1896; but it would be an interesting comparison indeed if the varieties he staged in 1858 could have been put side by side with Mr. Lunt's Japanese and Mr. King's incurved blooms at the Exhibition of the N.C.S. at the Aquarium on the 6th inst. The possibilities of development in the incurved section, and especially in the Japanese, appear to be almost illimitable.

The Persimmon, which has of late years received increased attention in the United States and some other parts of the world, is now being imported in considerable quantities into this country, and the rich orange-coloured fruits which are not unlike large oval plums have for some time past formed an interesting feature in the windows of the retail fruit shops. This fruit, which some people highly appreciate, has been improved during the past twenty years. The best supplies just now come to us from Madeira, and they are retailed at about four shillings per dozen. Presently, when the trade has been properly developed and the fruit itself popularised among a wide circle of consumers, enormous quantities will, it is believed by the most sanguine, be sent to the English markets, from California, particularly, where the fruit is grown extensively. The fruit can be picked when just ready to commence colouring, and will travel almost any distance and colour up to perfection in transit. The tree is a native of Japan, and when ripe the fruit has an agreeable sweetness.

Secondary and Tertiary Hybrid Orchids.—Mr. C. C. Hirst states that of the eight hundred distinct crosses recorded some two hundred and seventy are secondary hybrids, *i.e.* hybrids of the second generation, one or both parents being a primary hybrid; while thirty are tertiary hybrids, *i.e.* hybrids of the third generation, one of the parents, at least, being a secondary hybrid. So far no hybrid orchids are recorded to have flowered beyond the third generation, but perhaps it may not be premature to mention that unflowered hybrids of the fourth generation are known to be in existence. Mr. Hirst has in his collection six hybrids of the fourth generation, five years old, all raised from the same capsule, and which contain in their pedigree five distinct species and three distinct hybrids. So that in the near future there will be ample material in this direction at the disposal of the student of heredity; with this distinct advantage, that orchids being individually valuable, their pedigree is carefully and systematically recorded, which unfortunately is more than one can say of the great majority of garden hybrids. A careful examination of secondary hybrids shows them to be very different from primary hybrids in their range of variation. As we have already seen, primary hybrids are comparatively uniform in their characters; so much so that, as a rule, they are quite distinct from their parents. On the other hand, secondary hybrids have a much wider range of variation, often approaching either parent, and sometimes even reverting wholly to one or the other. For instance, to take the simplest form of a secondary hybrid, *i.e.* a hybrid crossed with one of its parent species. We find that the offspring, as a rule, are very variable, a few reverting to the parent species, and a few to the parent hybrid; but the great majority are intermediate forms approaching either parent, the whole forming a series of links between one parent and the other. In short, we find that secondary hybrids have a far wider range of variation than have primary hybrids.

Popular Chrysanthemums.—The *American Gardening*, following the example that was set in these pages many years since, has prepared an audit of the chrysanthemums staged in the first prize collections at fifteen of the principal exhibitions of the United States. One hundred and fifty-five varieties were shown, and those staged five or more times are as follows: Viviand Morel, 26; Mrs. Henry Robinson, 20; Major Bonaffon, 20; Frank Hardy, 19; Golden Wedding, 16; Modesto, 17; Mrs. H. Weeks, 14; Mutual Friend, 10; Minerva, 10; H. L. Sunderbruch, 10; Mrs. G. Peabody, 9; Mrs. Perrin, 8; Miss Georgiana Pitcher, 8; Chas. Davis, 8; Philadelphia, 7; G. W. Childs, 7; Mrs. Jerome Jones, 6; J. Shrimpton, 6; Eugene Dailledouze, 5; Inter-Ocean, 5; Jeannie Falconer, 5; H. W. Rieman, 5; Nyanza, 5; W. H. Chadwick, 5; Autumn Glory, 5; Newitt, 5; Pink Ivory, 5; Eureka, 5; Maud Dean, 5; Silver Cloud, 5.

Popular Plant Names.—In discussing the modern literary misconception of regarding Shakespeare's "long-purples" as the so-called "purple loose-strife," Sir George Birdwood makes, in the *Athenæum*, the following pertinent remarks with reference to the desirability of writers making themselves fully acquainted with the names of the plants they write about, for the purpose of avoiding the pitfalls for the unwary in dealing with the vernacular names of plants either when describing English scenery or elucidating the text of English writers. Shakespeare's "long-purples" are undoubtedly the purple-flowered orchids of our native flora. He writes: "It is very desirable that literary men and women, in dealing with the popular nomenclature of plants, should always consult some recognised authority on the subject. For inspiration and delight in such labour there is, of course, nothing to be compared with the fragrant folios of our great English 'herbalists'—Turner, and Lyte, and Gerarde, and Parkinson. But some training is required to use them aright; and even the experienced will find it safer to be guided in their use by such exhaustive and accurate handbooks as Prior's 'Popular Names of British Plants' and Britten and Holland's 'English Plant Names' (Dialect Society's publications). All the same one likes to work out these puzzles of nomenclature independently, or at least to verify the accepted solutions of them; and for the identification of the folk-names of plants to be found in our poets and other famous writers of the later Stuart, Georgian, and earlier Victorian periods there is no more trustworthy, suggestive, and alluring a help, exactly suited to the conscientious literary annotator, than William Hudson's 'Flora Anglica' (1730—Westmoreland—1793). It was from a copy of this work, presented by Colonel Conway (Horace Walpole's cousin) to Crabbe, that the latter imbibed his salutary and inspiring love of botany."

Royal Gardeners' Orphan Fund.—The proceedings at the December meeting of the Executive Committee of this charity afforded further evidence of the ability of horticultural societies to assist the gardening charities without taxing the individual members. The secretary announced, as usual, the donations received in the course of the preceding month, and these included the following amounts: Altrincham Gardeners' Association, £15 10s., proceeds of concert; Scottish Horticultural Association, £15; Canterbury Hospital and Charities' Fête, £5; Chislehurst Gardeners' Society, £3 14s., the profits of a non-competitive exhibition of chrysanthemums, for which a charge of twopence for admission was made. Mr. H. Herbst also contributed £5, the proceeds of his collecting-box. The nomination forms were passed at this meeting, and we regret to state that there are nineteen candidates for election in February next, as not more than about one-half that number can be placed on the pension list.

The Gale which commenced soon after midnight on Monday and continued throughout the following day did a considerable amount of damage in Great Britain and Ireland and caused considerable loss of life both on land and sea. The rooting up of trees has been general over the greater part of the United Kingdom, and more especially has this been the case in Greenwich Park and at Hatfield House. At Abergavenny a greenhouse was lifted up by the wind and blown into an adjoining window.

Pineapples from London Hothouses!—It is interesting to read, in an American contemporary, at a time when we are regarding the cultivation of the pineapple in Great Britain for commercial purposes as non-existent, that "enormous pineapples from London hothouses were novelties that attracted attention in the fancy trade" of New York. It would be still more interesting to learn the whereabouts of the "London hothouses" in which these "enormous pineapples" were produced, for we should like to see them. The *Times* believes that "it is quite possible that pineapple production will be revived, and in the near future become a very extensive trade in the British Isles. The superior quality, the more delicate appearance, the exquisite fragrance and flavour which distinguish the English from the imported fruit justify this prophecy." The expression of this belief does not, however, help us much in finding the source of the supply of London grown pineapples.

Relative Productiveness of Potatos.—During the past season two series of experiments were conducted by the Agricultural Department of the Nottingham University College on the Althorpe estate, one of these being for the purpose of determining the relative productiveness of varieties. Twenty-one varieties were included in the trial, and of these seven were first or second earlies, and the remainder belonged to the maincrop section. The most productive of the earlies were British Queen with 11 tons 18 cwt. per acre, and Challenge with 10 tons 17 cwt. per acre. The heaviest crops of the maincrop varieties were Lymn Grey, 12 tons 10 cwt.; Imperator, 12 tons 8 cwt.; and Up-to-Date, 12 tons 3 cwt.

Newcastle-on-Tyne Horticultural Society.—Mr. Isaac Brandon Reid, 30, Mosley Street, Newcastle-on-Tyne, has succeeded Mr. J. J. Gillespie, jun., as secretary of this society. Twenty years ago Mr. J. J. Gillespie, sen., was appointed the secretary of this society and continued to occupy that position until 1893, when he retired and had for his successor his nephew, who has recently resigned. During the period here mentioned the society has had two or three exhibitions annually, but in the coming year it will hold a summer show only in July, although it has at the present time a surplus in hand.

Seeds and Seed Testing.—A course of ten lectures and demonstrations on seeds and seed testing will be delivered by Mr. D. Finlayson, in the Royal Botanic Society's Museum, Regent's Park, on Monday afternoons, at half-past three p.m., commencing January 23, 1899. The following is a summary of the syllabus: January 23—Relative value of Samples, considered in relation to colour, size, uniformity, condition, maturity, age, purity of samples, essentials to germination, pedigree influence; adulteration and doctoring of seed. January 30—Effect of age of seed on its rapidity of growth and liability to disease; soil suitable; change of seed, why necessary; quantity of seed per acre. Grass seeds, comprising Meadow Foxtail, Rough Cocksfoot, Tall Fescue; impurities specified and described. February 6—Timothy, Tall Oat Grass, Perennial Rye Grass, Italian Rye Grass, Meadow Fescue; impurities specified and described. February 13—Fiorin, Yellow Oat Grass, Smooth-stalked Meadow Grass, Rough-stalked Meadow Grass, Evergreen Meadow Grass, Flat-stemmed Meadow Grass; impurities specified and described. February 20—Sweet-scented Vernal Grass, Crested Dogstail, Red Fescue, Hard Fescue, Sheep's Fescue; impurities specified and described. February 27—Wheat, Barley, Oats, Rye. March 6—Red Clover, Perennial Red, or Cow-grass, White Clover, Alsike Clover, Trefoil; impurities specified and described. March 13—Lucerne, Sainfoin, Suckling Clover, Crimson Clover. March 20—Special purpose grasses and other plants, namely, Yarrow, Kidney Vetch, Sand Reed Grass, Sea Lyme Grass, Hungarian Forage Grass, Schrader's Brome Grass, Reed-like Canary Grass (*a*) vegetable seeds, (*b*) flower seeds. March 27—The best turf produced by seeding and good management. Composition of good and bad mixtures of seeds for lawns, cricket fields, golf links, temporary and permanent pastures. Preparation of the soil, selection of suitable seeds, sowing the seed, and after management.

The Glastonbury Thorn.—The flowering of the Glastonbury Thorn (*Cratægus oxycantha præcox*) at Christmas is evidently a matter of much interest to a large number of horticulturists, for the note by Mr. F. W. Burbidge in our issue of the 24th inst. on the flowering of the tree in the Trinity College Botanic Garden has brought us numerous inquiries. According to the legend in the far-distant past, Joseph of Arimathea determined on a mission to christianise the Britons. Arviragus, who was then king, was not to be persuaded, but he rather encouraged the mission, and granted a piece of land whereon to build a church. When Joseph reached Weary-all-Hill, by Glastonbury, he thrust his staff into the ground, and this staff, after the habit of holy men's properties in very remote times, displayed remarkable manifestations. It put forth leaves, and the next day was in bloom. Henceforth this tree always bloomed on Christmas Eve, and slips thereof planted in other places invariably bloomed on the same day. No wonder that a pious people, but little troubled with the doubts and difficulties of a scientific age, regarded this tree as a thing very holy, and its blossoms as sovereign specifics for all the ills to which a remarkably troublesome flesh is heir. In the days when Henry VIII. was king the stout merchants of Bristol exported these precious blossoms to all parts of Europe, so great was the fame of their healing virtue. But the career of the tree was practically ended when Henry abolished the monasteries. St. Joseph's tree, the Holy Thorn of Glastonbury, grew up with twin trunks. In the reign of Elizabeth some effervescing Puritan laid the axe in grim earnest at the root of one of them, and a similar fate befel the other one during the wars of the Great Rebellion. Nevertheless a contemporary issue of a London evening paper states that on Christmas Eve in 1753 (new style) a great concourse of people assembled to see it bloom. They were disappointed, which is hardly to be wondered at, in a tree supposed to have been dead for more than 100 years. But behold a marvel! They watched it again on the following January 5th (old Christmas Eve), and then the tree bloomed as usual. Whatever it was that bloomed, the honest country folk were convinced that old Christmas Day was the true one, and the new style anniversary a thing of none effect. Now a slip of this tree had been planted at Quainton, in Buckinghamshire, and on the aforesaid Christmas Eve about 2,000 people assembled, with lanterns and candles, to see the annual miracle; they, too, were disappointed, and decided they would not go to church on the new Christmas Day. There are people who are persuaded that all these stories of the holy thorn are merely superstitions founded on a monkish trick; but a holy thorn is a common object. The solution of the mystery is to be found in the fact that the Eastern form of the hawthorn blooms naturally about Christmas, and should the weather be mild enough the plant asserts its habit and blooms at mid-winter. There is nothing marvellous in a staff formed of a branch of the thorn producing roots and growing into a tree, as many of the trees of the common thorn, of which the Glastonbury thorn is a variety, found in our parks, have been raised in a similar manner.

London Footpaths.—The Commons Preservation Society is doing a service by publishing maps especially devoted to the indication of footpaths in the north of London. The north of London is very badly furnished with open spaces. Of old time it possessed Finchley Heath and other wide stretches of common. But, while the poor sandy soil of the hilltops in the south of the metropolis fortunately offered little temptation in the days when enclosure was advocated for the increase of food, the richer open spaces of the north were rapidly reduced to cultivation. Beyond Hampstead Heath scarcely any open land remains save a few roadside strips and a fragment, at Monken Hadley, of the ancient chase of Enfield, itself apparently a survival of that forest of Middlesex in which the citizens of London enjoyed by charter a right of hunting. Fortunately some compensation is afforded to the landless inhabitants of Middlesex or Herts in the abundance of footpaths. Fields and woods and meadows are constantly disappearing under the advancing wave of London; it is the more important that all reasonable means of enjoying the surrounding country should be placed at the disposal of the millions of the metropolis.

Royal Botanic Society.—The fixtures of this society for 1899 are: Spring show, April 12; floral fête, June 7; and the meetings of Fellows, January 14, 28; February 11, 25; March 11, 25; April 8, 22; May 13, 27; June 10, 24; July 8, 22; anniversary meeting, August 10.

New York Fruit and Vegetable Supplies.—Great Britain is by no means the only country that obtains large supplies of fruits and vegetables from beyond her boundaries, but it is somewhat surprising to learn that the capital of the United States should be dependent upon foreign cultivators for a large proportion of the supplies of the products of the orchard and garden. The *New York Times* states that the city levies tribute upon all lands and exacts commercial contributions from the Occident and the Orient, from the torrid, the temperate, and frigid zones. Every ship that comes from the West Indies or the South just now carries its complement of fruit, and many of the Transatlantic liners bring to us fruits from the Mediterranean or Africa. Even in the matter of potatos the city is dependent at times upon other countries for her supply. It seems like carrying coals to Newcastle to bring potatos to America, but in reality there are half-a-dozen countries which look to New York as one of the chief markets for their potatos. Bermuda sells nearly all of her potato and onion crop in New York, and in winter potatos come freely from England, Scotland, Ireland, Germany, and some of the lesser European countries. The Scotch Magnum Bonum is said to be the best imported potatos, next to the Bermudas, and they have acquired quite a reputation. They all come in sacks, and, as the westward-bound steamers are in need of ballast, potatos are carried at a very small cost. The West Indies are also learning the ways of Bermuda, and shipments of potatos from there are increasing every year. There are a dozen different countries engaged in trying to supply New York with all the onions needed. France, Spain, Bermuda, the West Indies, Great Britain, and all her insular dependenciesf and even far-off Egypt, help to swell the total shipments of onions to New York. Before the Southern market gardeners of the United States get their vegetable products to market Bermuda and the West Indies ship all sorts of garden produce to New York. South America and Africa have more recently joined in this business, and consignments come from these countries every winter. Holland is an extensive shipper of cabbages to America; France sends early cauliflowers, and both France and Italy send celery. France has for many years been engaged in supplying London with many vegetables, but it is only recently that an attempt has been made to find a wider market for them in New York. A consignment early in March of asparagus, artichokes, celery, seakale, mushrooms, and rhubarb was made for the first time two years ago, and now every season the vegetables arrive. They are raised in Southern France, and are shipped in cold storage. As they are very fancy articles, they bring high prices, so that the shippers make good profits out of them. New Yorkers are willing to pay extravagant prices for fancy products out of their season, and it is a knowledge of this fact that induces the French gardeners to make the experiment. England sends choice hothouse grapes during the winter months that sell readily in New York at prices ranging from three to four dollars (one dollar = 4s. 2d.) per pound, wholesale.

Imperial Penny Postage.—On Christmas Day the postage of prepaid letters from this country for the undermentioned British colonies and protectorates was reduced to 1d. per ½ oz., instead of 2½d. as previously: Aden, Ascension, Bahamas, Barbadoes, Bermuda, British Central Africa, British East Africa, British Guiana, British Honduras, Canada, Ceylon, Cyprus, Falkland Islands, Fiji Islands, Gambia, Gibraltar, Gold Coast Colony, Hong Kong, India, Johore, Lagos, Leeward Islands, Malay States, Natal, Newfoundland, Niger Coast Protectorate, Niger Territory, St. Helena, Sarawak, Seychelles, Sierra Leone, Straits Settlements, Tobago, Trinidad, Turks Islands, Uganda, Windward Islands. The postage payable on letters addressed to other British possessions, or to any foreign country, and that payable on postcards, printed papers, samples, &c., for any part of the world remain unchanged.

The Fruit-growing Pastor.—The action of the Rev. C. Douglas Crouch, pastor of the Worthing Tabernacle, in promising to remit £100 of his stipend to his congregation is being much discussed, and is not without interest to horticulturists. Mr. Crouch states that he has conscientious scruples about the receipt of a stipend for his pastorship, but he was not able to give practical expression to his views until he came to reside at Worthing, and engaged in the fruit-growing industry. "Thanks," he observes, "to my work as a horticulturist, I enjoy splendid health. The exercise is good for me, and another advantage of it is that it has given me a practical acquaintance with the ups and downs of life."

SWEET-BRIER FOR THE NEW YEAR.

Not a few would consider it impossible to supply sweet-brier on New Year's Day, but more experienced growers have long discovered the possibilities of horticulture. It is many years ago since the seemingly impossible task came to me. Fortunately, perhaps, I made too light of it. There were plenty of sweet-briers about, and within a month of the date several plants were dug up and plunged at one end of the gardenia house. Here the sweet-briers had a bottom and surface heat of from 70 to 90 degrees; but instead of growing at once, or within a few days or weeks, few of them showed much or any signs of responding to such severe forcing conditions. Indeed, the efforts to force the growing pace some six months out of season were in the main doomed to almost complete failure. A few of the sweet-briers preferred to die rather than grow, while others seemed simply to ignore the forcing conditions, as if waiting quietly for the aid of April showers and the softer and more suasive effects of May dews.

These first attempts, however, proved extremely useful if rather stern and severe teachers of this lesson. Sweet-briers in particular, and the majority of hardy plants in general, resist sudden and severe changes of temperature. Such plants may be led or allured into acceding to almost all demands, but driven or violently forced, into little or nothing. It was worth not a few failures in sweet-brier forcing to have learned this lesson well. I know that strong examples may be quoted to the contrary, as that of not a few successful growers of lily of the valley, who freeze the crowns before placing them in bottom or surface heat of 70 degrees or 90 degrees. Retarded crowns, now rising in fashion and popularity, may be said to have won their popularity on this theory of pitting extremes of temperature against each other. The greater the diversity of temperature the more sudden the start. Well, this may be, in fact, is so, but it would be unwise to trust to any such law to help us in the forcing of sweet-brier, especially if under promise to provide a good vase of fragrant shoots for New Year's Day.

Most of the art of forcing sweet-brier, and, indeed, other hardy shrubs, consists in early and timely preparation. The briers for providing foliage and flowers for Christmas, 1899, and January, 1900, should have been potted up at the end of October or early in November, 1898. Where sweet-briers thrive in the open air it will be found they differ considerably in character and earliness. By selecting those thoroughly matured, and of moderate and generally uniform growth, it will be found much time will be gained later on. As to pots, eight inch, ten inch, and twelve inch are the most suitable and satisfactory, though pretty little plants may be grown in six-inch pots. Sandy loam with a dash of leaf-mould and a little well-rotted cow manure, or, if poor or hungry soil, with a sprinkling of bone meal, form a model compost for forcing sweet-briers. For drainage use an oyster shell over the hole, then add a few smashed bones, and a handful of turfy loam fills a larder with good things that will last for years. Before potting carefully dress or prune off any bruised roots and distribute those left regularly through the soil in potting. The latter should be firm, ramming the soil home round the roots. As soon as completed plunge the pots in a bed of oak or other long-lasting and slow-heating leaves, covering the surfaces with the same some four or six inches deep, thus rendering the roots quite frost-proof. Under a south or west wall is the best place for the briers, and there they should remain till March or April. The plants should then be carefully overlooked and sorted. The worst may be placed by themselves and gently forced for fragrant sprays or even welcome buds of eglantine. All the best plants should, however, be reserved for forcing in the early autumn for leafage and bloom at Christmastide and the New Year.

It is well to place the whole of the sweet-briers under glass, say in March, as it will then be found the roots are considerably in advance of the tops. Often at that early season the pots will be found full of roots, and the brier buds ready to burst into growth. A fernery, peach house, or orchard house at work, or a cool forcing house or pit at 50 to 65 degrees, would be the very place for sweet-briers from March to June. In such positions, with abundance of light, air, water overhead and at their active roots, growths, though rather slow the first year, would be strong, sound, and clean. But, with the exception of the few weakest plants, all this early growth the first year is rather preparatory to early autumnal forcing than forcing itself. None of the growths on the best plants should be used, but the blossom buds should be picked off. On June 1 at latest remove all the sweet-briers into a sheltered place in the open air. Syringe overhead at least twice a day, and keep the leaves clean and free from insects. Early in July place the plants in front of a south wall, plunging the pots full in the sun. Any pruning or removal of shoots that may be needed to preserve the form of the plants or hasten their early maturity should now be given. The less pruning, however, the better. During the ripening and resting periods, from July till the beginning or middle of September, no excess of water or stimulating mulches or manures should be given to the roots, for the more complete the maturity of the wood and buds the easier and more successful the forcing of sweet-briers.

By October 1st the briers for forcing for Christmas and the New Year should be under glass. By attention to the simple details here given much success may be reached the first year. But the older, in reason, the briers grow, the more floriferous, though not always the more foliaceous, they become. There is another strong point in favour of old plants. Habit becomes a sort of second nature, even with such strong conservative instincts, and hence the longer in reason the plants remain in pots the easier and the more surely they may be forced. Cleanliness and caution, careful maturing, top dressing, and mulching will suffice to keep sweet-briers in health for many years. But, as for pruning, the chances are, after the plants are fully established on early forcing lines, the plants will be pruned in excess for the supply of the fragrant branchlets and blossoms for which they are so highly prized. One more wrinkle—plants used to pruning for shoots and flowers in December, January, February, March, and so on, will be far better able to provide crops of similar beauty and fragrance ever afterwards.

Some prefer growing a double or a treble set of plants for forcing, for fear of exhausting their old plants, and readers will agree that the more sweet-briers there are in their gardens, in or out of doors, the better. All this, written of the common pink sweet-brier, with its brilliant scarlet hips and fragrant foliage, is equally applicable to the double scarlet and double white, which have never become common. There is also a superb red sweet-brier, of brilliant scarlet, and one with bright crimson flowers. Janet's Pride is a white brier, richly shaded and tipped with crimson stripes, very attractive, and likely to furnish us with a race of flaked sweet-briers in the near future, perhaps rivalling our flaked carnations or cloves. Lord Penzance's new hybrid sweet-briers will give new interest to this charming class of plants, as it has already brought us new colours with them without robbing us of the brier's fragrance. Several of them promise to be earlier and easier forced into growth and bloom in the winter than the uniquely sweet and beautiful common sweet-brier.

As to the forms of sweet-briers for forcing it is of less moment than may be thought, but where the plants are likely to be wanted in halls, dining or drawing-rooms, staircases, sitting-rooms, conservatories, corridors, &c., the plants may be trained into pyramids, standards, or loose bushes. Small standards in eight-inch pots have a dainty effect. The opposite extreme, where shoots only are wanted, may consist in filling boxes a foot or more deep with young sweet-briers, and forcing them *en masse* year after year for cutting. Some years since a bold spurt was made on the borderland of Covent Garden Market proper to push the sweet-brier in six or eight-inch pots as a window plant in London and its environs. One can but hope that such delightful home industries may be established or extended in all our large towns until every home and garden shall be lightened by the brightness and sweetened by the fragrance of one or many sweet-briers.

D. T. Fish.

THE NAMES OF ROSES.

It was the immortal Shakespeare who said, "A rose by any other name would smell as sweet," while the assertion of the deeply romantic Juliet was true, and illustrated her subject very effectively, there is more in a name, especially a modern one, than her philosophy ever dreamed of. It cannot, for example, be truthfully denied that in many instances our greatest professional singers, such as Patti and Melba, in addition to their gifts, which are unquestionably pre-eminent, owe much to their names. So also, doubtless, do our leading rosarians; but, it may be added, in a much lesser degree. A consummate vocalist may, in a moment of mental depression or physical weakness (or even after eating too hearty a dinner), sing with manifest difficulty of breathing, or on still rarer occasions entirely out of tune; nevertheless she will receive, in virtue of her name, £500 a night. But it is somewhat different with a great rosarian. His achievements are not transitory; like that of the poet, they are steadfast and enduring; they are the result of patient elaboration, they are intended to survive the utmost test of time. They do not always accomplish this; those that continue to exist for fifty years are assuredly the exception and not the rule. Yet the name of a great raiser, apart altogether from the merit of his creations, is even as in the artistic and musical worlds, a mighty charm to soften and subdue. A rose that has been originated (or "obtained," as Mr. D'ombrain would say) by a Guillot, a Verdier, a Paul, or a Dickson, owes much in the initial stages of its popularity to its raiser's name. But this also is certain, that unless it has great merit it will not endure. It is reputation, founded on lofty characteristics, that confers its peculiar glory upon a name. The fame of a rosarian may be, and is undoubtedly in every instance, a great advertisement for his productions; but unless they have original or supremely fascinating attributes their names will soon disappear from the catalogues, and their presence from our collections. This is an age of stern competition, and it is the fittest and strongest and loveliest that survive.

But even, I should imagine, the name of a rose—other qualifications and higher ones being owned by the variety—may have a distinct influence in the direction of popularity. Duke of Edinburgh, Duke of Wellington, Crown Prince, and Prince Arthur are, by reason of their very associations, popular names. So also should be such titles as Her Majesty (though almost any other rose would smell as sweet), Princess of Wales, and Empress Alexandra of Russia. There are abundant Dukes and Duchesses in our catalogues; the one variety among these most likely to survive is Duchess of Bedford. The fine fragrance of Duchess of Albany—a dark La France, of vigorous constitution—should be sufficient to preserve its other merits from oblivion. Papa Gontier should live, notwithstanding its somewhat childish name, which has nevertheless a charming flavour of affectionateness. So also should Susanne Marie Rodocanachi, an invaluable rose for exhibition purposes, by reason of its form and rich, roseate hue. One of the most peculiar of all names discoverable among the hybrid perpetuals is Xavier Olibo, which instinctively suggests to my imagination a half-caste, nurtured in a tropical clime. Not many varieties have classical names Homer and Sappho being notable exceptions; likewise Medea, the fairest of the three. I like such unassuming titles as Margaret Dickson, Jeannie Dickson, and Clara Watson; also that of the beautiful Souvenir de S. A. Prince. Grace Darling suggests heroism; Victor Hugo, poetical and dramatic achievement; Charles Lamb, humour, originality, and amiability; Niphetos, purity, like that of the virginal snow; Reynolds Hole, giftedness and good-nature; Bride and Bridesmaid, the fruition of love; La France, patriotism, poetry, and romance.

David R. Williamson.

A MORNING MIXTURE.

Diluculo surgere saluberrimum est.

THIS is a time of year when a little "looking backward" is indulged in. Not quite so far as the late Mr. Bellamy threw his revolutionary survey in the book under the title quoted, for we gardeners are on the whole rather too much absorbed in the practical questions of the moment to dream advanced social dreams. We pass in placid review the more notable events and controversies of the year. The Victoria Medal of Honour, founded last season, has matured this. Even those who are not recipients will think with pleasure of this event. There may be here and there a disappointed one who is inclined to carp because his personal expectations were not realised, but the great majority realise too clearly how great an honour and dignity have been conferred upon horticulture to do other than rejoice. The inspiration which led to the founding of this medal was a happy one; the choice of persons upon whom to confer it was (if I may be permitted to say it) most admirably made. Doubtless more than one of the sixty would gladly have stood aside in order to allow Sir Trevor Lawrence and the Rev. W. Wilks to come in, but the decision of the Council excluding its own officers was generous and in the best of taste.

The affairs of our leading societies come under consideration at any moment of leisure. The R.H.S. stands first, and it is safe to say that it will continue to do so while its present vigorous policy is pursued. It is in a stronger position now, perhaps, than it has been any time during the past half-century. The move to the Drill Hall, so thoughtlessly, and even rancorously, criticised by considerable numbers of people who are incapable of taking a broad view of any matter, has proved to be thoroughly justified. Of course it is not an ideal place; we all know that, but it is a place the public are quite prepared to go to if they believe there is anything worth seeing. Certain persons still affect to believe that a London centre ought to be given up altogether and Chiswick reverted to. Let us be mild and charitable, and, instead of saying all we could say about these excellent persons, merely remark that they are suffering from shortsightedness. The attack is not quite so severe as it was, their vision is gradually improving, and I am not without hopes that with care and patience we shall bring them round altogether. Let them take the "Magazine mixture" regularly, and things will further improve.

My heart is so full of kindness towards many of the people who still cling fondly to the idea of a great Horticultural Hall—they are in every way so estimable and well-meaning—that I cannot bring myself to pour ridicule upon them as unsparingly as I should if they were merely blatant self-seekers. As, with identity all unsuspected, I wander round the Drill Hall, or through the Crystal Palace, or the Royal Aquarium, or about the other places where gardeners most do congregate, I perceive that the hall still weighs heavily on the minds of many. They speak of it with a tender melancholy, as of a beauteous project which soulless Philistines have crushed, and not with the hopeful anticipation of former years. But the idea is there still. In the minds of these good souls the Horticultural Hall rears itself aloft in a prominent position, somewhere not far from the Thames Embankment. It is a noble and majestic structure. Crowds line the approaches to it, and crowned heads and courtiers throng it. It is a place where summer perpetually reigns—and—and—it pays its own expenses! Mere prose cannot do justice to it. Let me imitate the harmonious Peter, and tell its story in verse—

There is fog along by Blackfriars, fog on Ludgate Hill,
  Thicker still it rolls by Waterloo;
The wheezing City magnate goes home to make his will,
  His clerk locks up and sneezes—at-i-choo!
The Strand is bare and vacant because the road is up—
  Lumbered in the old familiar style;
The passer-by who hurries across the Thames to sup
  Thinks with envy of the mud-banks of the Nile.

Fleet Street is black and grimy, as it always used to be,
  You really couldn't clean it if you tried;
The Temple is not much better, and, 'twixt you and me,
  It's hard to penetrate a lawyer's hide.
Up as far as Holborn, down to Billingsgate,
  Over there beyond the Borough Road,
The streets are like a mud bath, the sky is like a slate,
  The river's of the colour of a toad.

Ugh! You squirm and shiver, dismal citizen,
  All your pride in London's flown away;
Even St. Paul's the mighty, beautified by Wren,
  Swiftly loses all its wonted sway.
In the square where Nelson, towering in the sky,
  Turns his face of stone to Britain's foes,
Smuts and sooty flakings from chimneys downward fly,
  All adding to the burden of your woes.

But there beside the river, vision fair and bright,
  Stands a hall with high and gilded dome,
Odours rare and dainty, through the murky night,
  Flow from London's treasured floral home.
All the choice exotics, all the native flowers,
  Give the tortured eye and brain relief;
Hither hasten gladly, to while the dreary hours,
  Clerk and lawyer, leaving desk and brief.

Shed, O hall of beauty, shed your light afar,
  Guide the weary million's wandering feet;
Exorcise the demons, happiness that mar,
  Or warp the rightful base of reason's seat.
Help the weary toilers in their upward climb,
  Give of joy and sweetness to each soul,
Spread illumination till the hoped-for time
  When each name's inscribed on Flora's roll.

If the Hall of Horticulture is quiet just now the same cannot be said of the National Chrysanthemum Society. Vigorous discussion goes on about it. Week in, week out the debate is continued. This is not by any means so bad a sign as some people think. There are nervous persons in the world who dread dissolution directly controversial matter crops up, yet there are facts in support of the opposite theory, namely, that differences of opinion, freely and openly expressed, are an indication of health and virility. Freedom of inquiry and the thorough thrashing out of any knotty point form the keynote of our parliamentary and legal institutions, which are the admiration of the world. Therefore I for one refuse to believe that the N.C.S. is in danger of collapse because a strong Opposition has arisen in its debating chamber. With wise management and prudent forethought the criticisms which are being hurled at the society must serve to strengthen it. Having very carefully studied the matter at first hand I have come to the conclusion that the Opposition is just strong enough to do good by its policy of criticism, but not strong enough to do the harm which might ensue if the present management were completely overturned.

And what of the National Rose Society? A few years ago there was a little controversy regarding it. Did the criticisms indulged in do harm? Quite the contrary. The measures for rejuvenating it proposed by some active spirits, led by Mr. C. J. Grahame, were not all carried into effect, but several that were sharply debated came to maturity and answered well. I am not at all sure that more good might not be effected by reopening other controversial matters, although the officials who have to bear the sting of attack, may not agree with me. If you criticise a public body, those who belong to it are aroused from their lethargy by the necessity of repelling assault, and become active fighters in its cause, while it and its affairs are advertised to the outer world of non-members. However, I for one am not going to begin this week. Let the old year go out in peace, rather than the officialdom of the N.R.S. in pieces.

In bidding farewell to 1898 we of the older generation do so with a little regret, for we feel that our number of years is all too few. But do not let the young blood think we are played out yet. Not a bit of it. We are full of courage and cheerfulness for the future. Whether our allotted span be short or long, we mean to go ahead as hopefully as of yore. We know that gardening is a noble cause to work in, that it is worthy of all our energy, all our love, all our enthusiasm; and, even if it be not the most lucrative profession on earth, it still remains in our regard one of the greatest and best.

Farewell, farewell, O Ninety-eight,
  Hark! a chime
Reminds me that the hour is late,
  'Tis Ninety-nine!

There, good friends, is our New Year card to you. LUX.

RIPENING OF PEARS.

FAVOURED by good weather during the autumn months, the pear crop in the south-west of Scotland was a very satisfactory one, both for the size and quality of the fruit, and also, I believe, in most places for a fair average crop. In these gardens early varieties, as Beurré Gifford, Jargonelle, Williams' Bon Chrétien, and others, bore a full crop, which, owing to a plentiful rainfall and the bright warm weather at the time of ripening, finished off better than usual. Later sorts were also very good, and, as frost was not in evidence until November was well advanced, these were allowed to hang upon the trees as long as possible, and in consequence the season of some of the better varieties was considerably prolonged. Marie Louise is the most popular pear here, and, as it is more extensively planted than any other, an effort is always made to have some of the fruit ripe as early as possible, and by leaving others on the trees until the leaves fall it may in seasons of plenty be had fit for use for six or eight weeks, during which no other variety is inquired for. This season the last fruits were used early in December, at which time Beurré Diel and Doyenne du Comice, which usually succeeds it in order of ripening, were also past their best. The two last-named varieties can generally be depended upon to keep up the supply until Christmas, and sometimes even later.

To illustrate the irregular manner in which late varieties are ripening, I may state that Easter Beurré is at present date, December 14, being sent to table, and the fruits, both for size and quality, are superior to any that have been ripened here for several years past. This freak of precocious ripening is not due to early gathering of the fruit, as this was not done until November, and afterwards the fruit was kept as cool a possible. Other late sorts, as Winter Nelis, Nouvelle Fulvie, Oliver de Serres, and Ne Plus Meuris, are also showing indications of early maturity, so that the prospect of a plentiful supply of fruit after the new year has commenced is not promising.

Galloway House, Garliestown, N.B. JAMES DAY.

A Good Winter Tomato.—In a low fire-heated pit at Clandon Park I recently saw one of the finest crops of tomatos that have for the time of year come under my notice. I saw the plants on November 22, that terribly stormy day. The entire portion of each plant, about four feet in length, that was trained upwards close under the pit lights, was thickly hung with fruits, ripe and green. These were of nice medium market and table size, rich in colour, perfectly handsome, and quite free from fungus, although growing in a low, close, stuffy pit with hardly any head room, and the crop would doubtless continue to be productive of good ripe fruit up to the end of February. The variety is not properly known, as it originally came as a single plant from a sowing of Ruby, from which it greatly differs, and it enjoys the privilege, strange for a tomato, of having no name. The lower part of the stem had cropped heavily from the beginning of August.—A. D.

CHRYSANTHEMUMS FOR EXHIBITION.

SEASONABLE WORK.

May I, on the threshold of another year, suggest, through these pages, to those who are more or less timidly entering the field of competition to assure themselves at the commencement that success may be attained in one way only, and that by patient, careful, plodding attention to the wants of the plants constantly from the day when the stout, healthy cutting is put in till the full and perfect development of the bloom is accomplished. The certainty that there is no royal road to success in any of our labours is never more true than when applied to the growing of exhibition chrysanthemums, and this fact is encouraging to the grower of limited resources, because he may know that in proportion to the thought and intelligent care which is bestowed on the plants, so great will be the resultant satisfaction in "the time of the chrysanthemum."

From first to last it is the small and apparently trivial details which are the most important, because these are the most likely to be neglected. We are sure to take cuttings, to give water, to repot, and so on, but we must always do this knowing that it is requisite and expedient to the well-being of the plant. No general treatment will answer, such as watering to-day to prevent the plants drying to-morrow, or postponement of the repotting until it suits our convenience; we must ever allow the needs of the plant to dominate, and our own pleasure to submit in full and loyal devotion to the "flower of autumn." It should by no means be imagined that this self-abandonment is without reward till the flowers unfold, for I feel sure that there is to all growers a vast amount of pleasure derived from tending the healthy plants and responsive growth throughout the season, in a measure almost equal to the satisfaction which the blooms themselves give, perhaps more. More, because in the flowering we have the consummation of our hopes achieved, mingled, as doubtless will always be the case, with a few disappointments, and so we commence again, our energy and determination to excel whetted in proportion to our past reverses. This is the spirit that leads us to our ideals sooner or later, and we may be sure that very few attain success who do not well deserve it.

The anxiety to obtain all the advantage of an early start in propagation prompts many people to be busy about their young stock during the first week in December, or even earlier. There is no real advantage in such a very early commencement, however, beyond the securing of whatever good cuttings are then to be had. It is more important to pay attention to the stools as soon as the plants are cut down, and give these as light and airy a place as possible, removing all weak and overcrowding suckers, and thus encouraging, by every means, the sturdy and short-jointed young growths from which the cuttings are to be taken. Having disposed properly of the stocks, the place for the reception and rooting of the cuttings must be made ready. The best position for this work is on the side benches of a light and cool greenhouse, where cases may be improvised, or handlights, or small frames arranged, with a base of fine ashes or similar material, to conserve moisture beneath the cutting pots. The tops of such frames must be covered with sheets of glass, to keep a close atmosphere about the young cuttings, and prevent their flagging. With such convenience and a command of sufficient warmth to keep a temperature of not less than 40 degrees in severe weather, with a rise to 50 degrees when possible, there will be little difficulty in rooting the cuttings.

Commence about the middle of December by taking those first which are naturally late in producing their flower buds, following with mid-season varieties and leaving those which are usually early to bloom until the end of January before the cuttings are severed from the parent stools. In this way we can assist a more uniform development of blooms, and obtain them in best condition at a given time. Though it may be wise to take a really good cutting of any variety of which stock is short, even if it should be rooted later, there are a few sorts, and especially those which are inclined to make buds early in the season, such as Viviand Morel, Charles Davis, and Lady Hanham, which are best propagated during February, because if rooted late the growth is not subjected to the short days, but comes away more clean and rapidly under the increasing sun power of spring months.

The usual practice is to give each cutting a small "thumb" pot, for the reason that when rooted and ready for repotting no appreciable disturbance of the roots is necessary in the operation; but, after all, there is not much to be gained in this, and I am sure that cuttings rooted in shallow pans or boxes, and lifted carefully with their roots intact, succeed quite as well as those rooted singly in small pots. They may also be placed near the edge of three or four-inch pots, but for preference the boxes are most satisfactory; cuttings placed in these at two inches apart lift admirably when rooted, and are ready for three-inch pots. The soil is not an elaborate mixture for propagating purposes, the most essential quality being that it must contain plenty of sharp grit or sand, so that water passes through freely, or there will be some loss through decay at the base of the cutting. Readers will gather that of the several means to the end we cannot say that of those mentioned one is very superior to the other, and circumstances will dictate just the details most suitable to each particular case. The object is to secure stout, healthy cuttings, and treat them so that in a temperature as indicated they form roots freely, and in the space of about a month from the time they are inserted. As cuttings are planted they should be well watered before being placed in their cases, and, generally speaking, will not require further watering until roots are formed. Daily attention will be required to remove any decaying foliage, and, in case aphides should appear, to instantly destroy them; also when moisture condenses heavily on the glass covers this must be removed. Shading may occasionally be needed, but only when the sun is sufficiently bright to cause flagging of the leaves.

Trent Park Gardens. W. H. Lees.

NOTES FROM IRELAND.

With reference to Mr. Molyneux's suggestion of showing chrysanthemums in vases, it may be of interest if I state how these are staged at the show of the Royal Horticultural Society of Ireland, where this departure has been a feature for the past two years. I believe it was Mr. H. Crawford, of Mount Merrion, who offered the first prize in Dublin for chrysanthemums staged in vases, and, unless I am greatly mistaken, the donor on that occasion was the winner. This season Mr. H. J. Jones kindly presented a silver-gilt medal in addition to the first cash prize given by the society. The wording of the schedule for this class is as follows: "Three vases of chrysanthemum blooms, in three varieties, three blooms of each; stems to be not less than twelves inches above the top of the vase. Only chrysanthemum foliage will be allowed. Vases will be provided." The competition in this class was very keen. The vases were arranged on an oblong table, so that judges and visitors could inspect them at their ease on both sides. I quite agree with the writer quoted, that five large blooms in a vase would be too heavy an arrangement, but as arranged in vases of three, as in Dublin, the effect is splendid.

At the recent show of the Royal Dublin Society, held at Ball's Bridge, Dublin, Messrs. Sutton and Sons, of Reading, had an interesting collection of thirty-four varieties of disease-resisting potatos, representing the following varieties introduced by the firm, viz.: Windsor Castle, Reliance, Ideal, Triumph, Satisfaction, Supreme, Flour Ball, Ninetyfold, Invincible, Ringleader, Abundance, and Magnum Bonum. A novel and interesting feature on this stand was the panoramic views of flowers and vegetables, illustrating the results obtained from Messrs. Sutton's seeds, as grown by themselves or their customers.

Messrs. M. Saunders and Sons, Friars' Walk Nurseries, Cork, had a stand of trees, fruit, shrubs, &c., which for excellence of arrangement completely eclipsed their previous laudable effort at the chrysanthemum show; the exhibit consisted of 150 dishes of apples and pears, perfect in size and colour, and comprising the bulk of the varieties best suited to Ireland. Fruit trees were splendidly clean specimens in the pink of health; forest trees, coniferæ, shrubs, and palms completed this uniquely arranged stand.

Messrs. Hogg and Robertson, Mary Street, Dublin, had a stand on somewhat similar lines to that of Messrs. Sutton. This firm's stand was probably the best arrangement of the kind ever set up by an Irish house, so we are evidently "forging ahead." Conspicuous on this stand was the firm's new potato Champion 2nd, in both a raw and cooked state. It is unquestionably a splendid cooker, with a heavy cropping and disease-resisting reputation. Particularly interesting on this stand were the large number of seedling potatos on trial.

Potatos were numerously shown, some hundreds of dishes being staged, and, judging from them, potatos must have been a superb crop throughout Ireland. They comprised all the leading varieties in cultivation. The produce staged in the "Foxford Cottiers' Competition," consisting of farm and garden produce, was highly meritorious, mangolds being the only weak point; potatos, parsnips, and carrots were splendid. There were some sixty entries in this class.

The collections of vegetables were very good, cauliflowers only being weak, while onions were decidedly the strongest point. In these collections some very fine tomatos were also staged. Mr. W. G. Pim, Mountmellick, was the principal prize-winner in this section of the show, closely followed by Mr. J. S. Boyle, Knowhead, Coleraine.

Looking through the houses at Lyons in this county the other day I saw the finest specimen of Daphne rubra that has ever come under my notice; it was planted out at one end of a large house. The plant is five feet high and four feet in diameter, and is in the best of health. A brilliant feature in a large stove was an exceptionally well-flowered batch of Plumbago rosea. One is so accustomed to seeing this so indifferently grown and flowered, that I paused in surprise at this brilliant mass of flower. Centropogon Lucyanus, too, was exceedingly well flowered. A very fine batch of calanthes, also, was noticed, many spikes having upwards of forty flowers on them. Cœlogynes in variety are very promising, also a fine sample of Dendrobium chrysanthum. In a pit I noted the finest batch of cyclamen I have seen for the past four years, the foliage was as luxuriant as vines, and covering a forest of flower buds. They will be somewhat late in flowering, but why Mr. Rigg, the talented gardener, does not get them in flower in November and exhibit them passes my comprehension; he should easily sweep the board. A splendid assortment of Primula sinensis were coming into flower in another house. The relics of the chrysanthemums gave a fair idea of the brilliant show they had produced not long since. I do not remember at any time seeing Ipomæa Horsfalliæ flowering in such profusion as it is at Lyons; Mr. Rigg attributes this to frequent pinching. A special favourite with Mr. Rigg as a table plant is Clerodendron nutans, a plant I was not previously acquainted with, and of which I came away with a very high opinion. Carnations and violets are two striking features in these well-kept gardens. At a more favourable season of the year I hope to give you a detailed description of the grounds, &c., rich in choice shrubs, trees, &c.

The weather here continues very wet and windy, with every prospect of a green Christmas. If this district is any criterion, holly berries will be at a premium for the festive season, as every tree I have seen is completely destitute of berries. In conclusion permit me, Mr. Editor, to congratulate you on your Christmas Number, which, in my humble opinion, has completely eclipsed your former successful efforts in this direction.

Curragh Camp. R. Weller.

VEGETABLES FOR EXHIBITION.

THE TURNIP.

TO produce turnips (*Brassica Rapa*) of the best quality the whole year through taxes the skill of the gardener as much perhaps as any crop cultivated in the kitchen garden, and few vegetables are more in request, especially in large establishments, so that much care and forethought will be found necessary to meet the demand. The turnip is a moisture-loving plant, and during a hot, dry summer, especially through July and August, some trouble will be experienced in producing it fit for table. Almost any kind of land will grow good turnips, but a shallow, sandy soil is about the most unsuitable during the summer months. The very best turnips I have ever been able to produce were grown on a stiff clay in the gardens here, but not without some little trouble in the preparation of the ground. Fortunately we have now a much better selection than our fathers had, especially among the early varieties. Quick growth is at all times most essential, as without it the bulbs will be hard and strong in flavour.

The first sowing should be made under glass the first week in January on a very mild hotbed, which should be composed of leaves, and the heat should be well on the decline; indeed, it should be pretty well exhausted before sowing the seed, as the effect of the glass will be almost sufficient with covering in severe weather to promote a sufficiently free growth. One foot of soil of a light, porous nature should be placed on the leaves, and the seed should be sown in drills nine inches apart, thinning the seedlings to six inches when large enough. Small and frequent sowings should be made in this way rather than large quantities. Air freely on all favourable occasions, syringe, and shut up early in the afternoon, and do not allow the plants to suffer from want of water at the roots. If suitable varieties are cultivated in this way they will be found invaluable for early supplies.

Early in February, or as soon as the weather will permit, the first sowing should be made outside on a south border on well-prepared ground, which should have been trenched during autumn, but not manured. Simply fork over and rake down the ground to a fine tilth, and sow in shallow drills ten inches asunder, thinning out the crop to six inches apart. The ground should be kept constantly stirred with the Dutch hoe during April and May. The seed may be sown on well-prepared ground in any open part of the garden, making the sowings frequent and small in dry weather; the drills should be thoroughly dusted over with soot and wood ashes. The young plants ought not to be allowed to become drawn, but should be subjected to a double thinning, leaving them the first time about as thick again as required till they are well into the rough leaf. Before their final thinning water thoroughly in the evening in hot, dry weather, and in showery weather apply small dressings of artificial manure. The ground can hardly be stirred too often with the Dutch hoe; indeed, every encouragement should be given to promote a quick and healthy growth. In May, June, and July sowings generally give the most trouble, and in very hot, dry seasons it is almost impossible to produce turnips fit to eat unless some extra care and attention be bestowed on them, for in addition to the turnip fly, which is most active and destructive in hot weather, the plants refuse to make a free growth when fully exposed to the sun, so that it is absolutely necessary to select a cool, shady part of the garden for the sowings and to afford temporary shading from the time the seed is sown until the plants are thinned and in the rough leaf. Unless the weather should be dull and showery, shade the seed beds with mats, or any suitable material; after the first three days this should be removed early in the evening, when the beds should receive a good watering, the shading being replaced during the daytime, and this should be repeated each day till after the plants are finally thinned. It will be necessary to keep the crop well supplied with water, which ought always to be given in the evening, and also to dust the plants over every three or four days with soot and wood ashes.

From the 20th of July till the 10th of September the autumn and winter sowings should be made, and it is a good plan to sow every ten days; the weather has such influence on the growth of the turnips that it is not wise to depend on any one sowing. I have known the September sowing prove to be the most useful for winter use, indeed only last winter (1897-98) this was the case, and the roots actually grew the whole winter through, and even when the roots fail to be of any use as such they are valuable for supplying greenstuff during spring. The smaller the roots the less likely are they to be harmed in severe weather. Hoe frequently and apply soot and artificial manure during showery weather, The whole of the turnip crop ought not to be left to the mercy of the weather, or many bulbs will be spoilt in sharp seasons. I advise lifting a good portion of the largest examples in early winter, trimming the leaves off, but not too hard, and leaving on the tap root. These are best stored in clumps in the open, but in no case must they be heaped together in large quantities, or they will heat and spoil. I have found them keep well when placed in layers, alternating with soil or cinder ashes, building the clump up ridge shape, and covering all with a little straw and about three inches of soil. The remaining part of the crop can be protected in ordinary winters by drawing a little of the soil over the roots with the hoe.

The turnip is of considerable importance to exhibitors of vegetables, and at some seasons of the year it is of great service, though, generally speaking, in my opinion, too much value is attached to it, as I consider the time of year and season should be taken into consideration. Of course, I am referring now to turnips shown in collections of vegetables. I know of no vegetable more easily produced during a good spring or autumn, and I consider it unjust to compare turnips with other vegetables that are more difficult to produce. To obtain turnips of the highest degree of excellence requires, like many other things, some extra care and attention, and any and everything that can be done to assist the young plants and induce a free growth should be done. On all kinds of lands I advise drawing the drills about one inch deeper than is necessary for the seed sowing, and into these should be placed some finely-prepared compost, nothing being better for this purpose than the old soil from the potting bench, adding to each barrowload a peck each of soot, lime, and wood ashes, thoroughly mixing them before use. After the seed is sown cover it with similar material. When raking down it is absolutely necessary that the surface should be made as fine as it is possible to make it, first working with a wooden rake, and then finishing with an iron one. Birds are often very troublesome when the seeds begin to germinate, and when once they take to them they generally ruin the whole crop, unless steps are taken to protect them. Garden netting stretched over iron hoops is the neatest and best mode of protection. No time should be lost in thinning out the seedlings. Water freely in dry weather, and dust over once a week with soot and wood ashes, and once a fortnight give a slight dressing with some artificial manure.

Turnips ought never to be very large when exhibited, yet this is frequently the case; medium-sized roots are best, no matter what the variety. The skin should be perfectly clear, the tap root small, and the rind quite tender, so that the thumb-nail may easily penetrate it. Carefulness in preparing and washing them must be observed, as the better the specimens the more easily they are damaged, and then the least scratch will be noticeable a short time after. For washing, a brush should not be used, but soak the turnips in cold water for half an hour, and then remove the dirt carefully with a soft sponge, rinsing the roots well in clean water. All the small rootlets should be carefully trimmed away, but not the tap root. This may either be cut off on the morning of the show, or left on at the pleasure of the exhibitor. Personally I like to see them cut off, unless they are particularly small and clear, when they add somewhat to the appearance of the roots. The bulbs should be wrapped up in white tissue paper (on no account use printed), and packed carefully in wood-wool. Nine or twelve is generally the required number for a dish, and they should be as much alike as possible, and the roots look best when arranged neatly on a dish well garnished with good parsley. They should be kept covered till the last moment.

The varieties I can strongly recommend for frame culture and the earliest sowings outside are both Early Red and White Milan. They are both very quick growing, and of good flavour when used small, and for very early shows are unequalled. For later spring sowings Carter's Jersey Lily is one of the most handsome and best flavoured turnips that I am acquainted with; for exhibition purposes it is simply perfect. Sutton's Snowball is also excellent for all purposes. Veitch's Red Globe is a first-rate summer turnip, and stands better in dry weather than any other I know, though it is not quite so handsome for exhibition as some. For all later sowings I recommend Jersey Lily and Snowball. Chirk Castle, or Black Stone, is a particularly hardy variety, and a small sowing should always be made of it about the middle of August.

Aldenham Park Gardens. EDWIN BECKETT.

THE AMATEUR QUESTION.

"CONFUSION becomes worse confounded" under Mr. Taylor's insistence upon such hard and fast lines. It comes to this, that in his opinion no one is an amateur who does not come under the definition of one as laid down by the National Amateur Gardeners' Association. That appears to me to be an intolerable and most unjust narrowing of the term amateur, because any amateur who raises seedlings, however valuable they may be, is precluded from selling them; if he does so he ceases to be an amateur. As a member of the National Chrysanthemum Society I have been labouring under the impression that the definition of an amateur as set forth in the society's schedule was based upon that of the N.A.G.S., if not identical with it; and that permits amateurs to sell new seedlings and sports. I do not think it would be at all difficult to procure documentary evidence that there are members of the N.A.G.S. who do sell "new seedlings or sports." I should not be in the least surprised to find there are some among the members who sell *sub rosâ*, for human nature, even among amateurs, is by no means perfect; and hard and fast lines in the narrowest sense will operate to raise the old Adam in a man, and lead him to resort to evasions. There are many definitions of an amateur extant, and all more or less differing, and to lay down one that shall commend itself to everyone is a practical impossibility. One of the most sensible and acceptable definitions of an amateur is that to be found in the schedule of prizes of the Torquay District Gardeners' Association. It is as follows:—

Rule XIII. For the purpose of these Exhibitions the word Amateur *excludes* the following:—

(*a*) Nurserymen.
(*b*) Those who grow purposely for sale.
(*c*) Those who professedly offer their garden produce for sale.
(*d*) Those professionally employed by any of the above.

A casual selling of any surplus stock is not to be considered as disqualifying anyone from exhibiting as an Amateur.

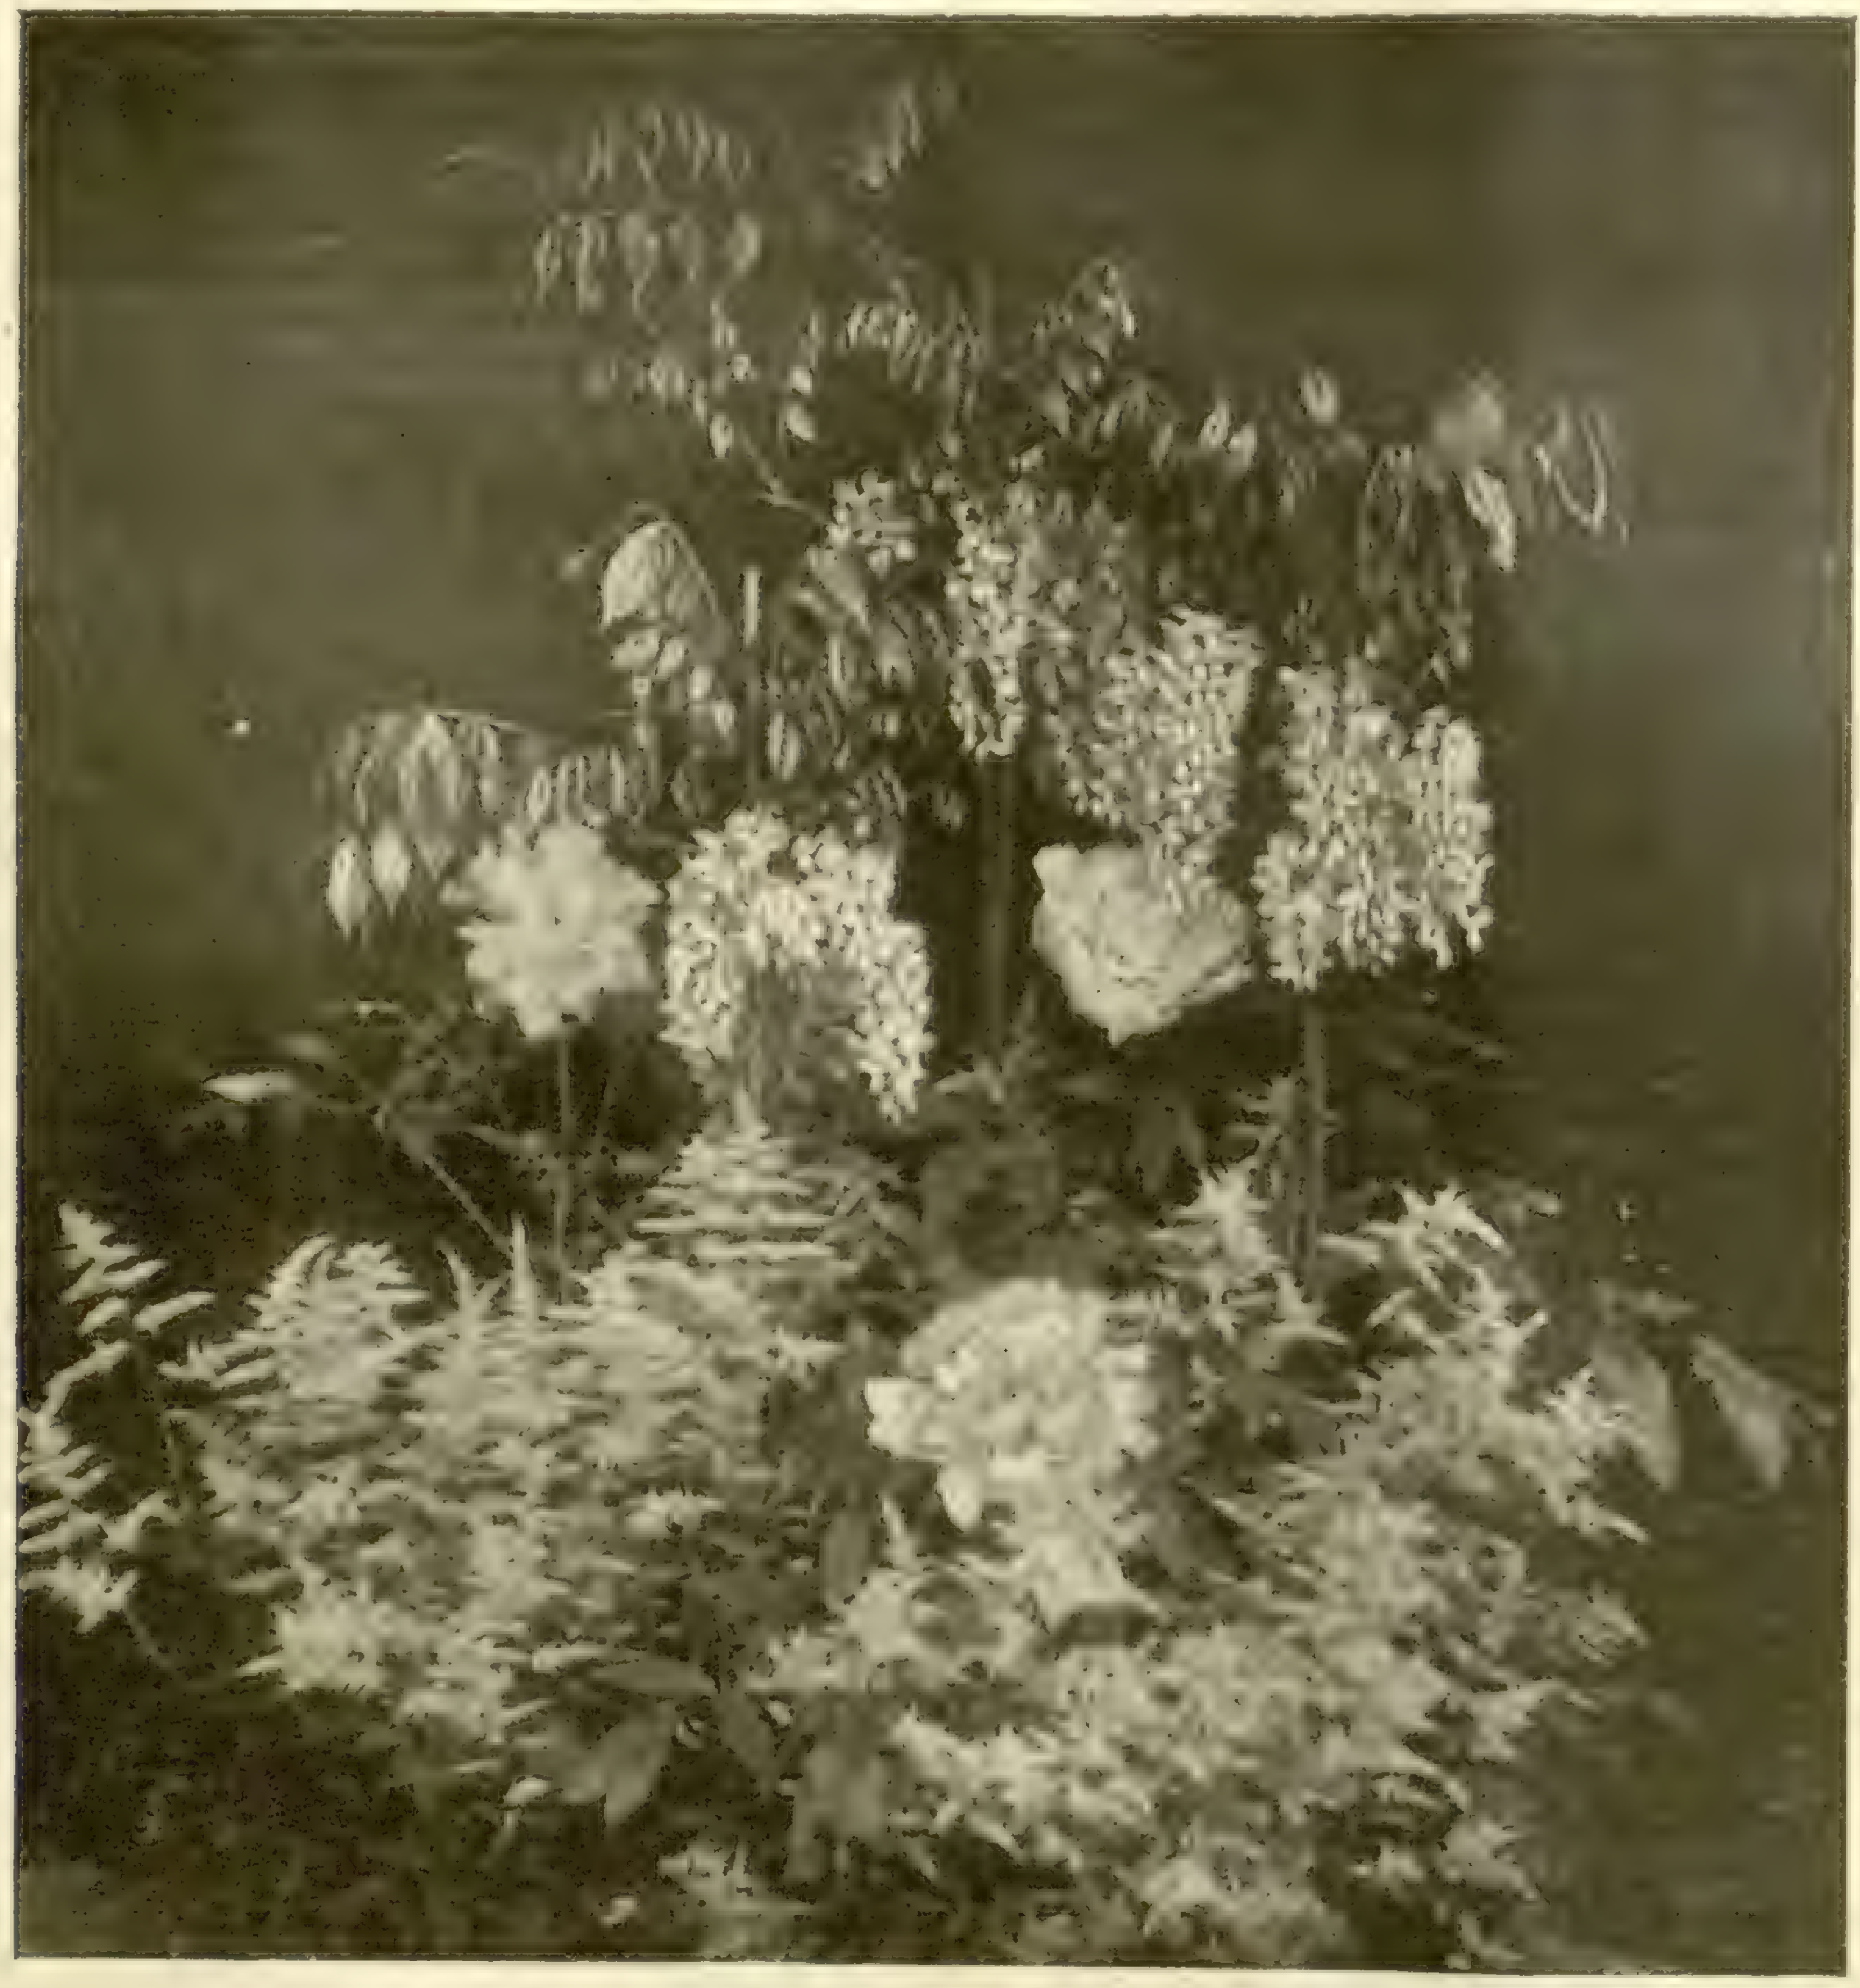
Would anyone be bold enough to assert, because the Duke of Westminster or Mr. Leopold de Rothschild sells off such foals from their brood mares that they know cannot be trained, that therefore they are professional horse dealers? Neither of these, nor the amateur who sells a few surplus plants during a brief period of the year, becomes a trader in the generally accepted sense of the word. A trader is one who makes what he sells the chief or sole means of livelihood. A casual sale is, in the large majority of cases, simply the means by which a person of limited means who loves flowers for their own sakes, and by selling some surplus plants is provided with the means by which he can add expensive novelties to his collection. An act of barter or exchange with a nurseryman is just as much a trading transaction as if actual money changed hands, and it seems to me to be an ignoble evasion of the hard and fast lines Mr. Taylor would impose upon all claiming to be amateurs.

A WESTERNER.

One for his Nob.—Winter Strawberry (to Giant Gooseberry): "I say, old chap, I think I've knocked you out this time." [The gathering of dishes of strawberries is reported from all parts of the country—Daily Paper.]—*Punch*.

STANDARD WISTARIAS.

There is so great a difficulty in varying the effects produced in the conservatory that we have especial pleasure in presenting our readers with the accompanying illustration of a group of flowering plants that came under our notice in Messrs. J. Veitch and Sons' nurseries in May last. All the plants of which the simple arrangement consists are known to the general body of cultivators, for they are none other than Wistaria sinensis, tree pæonies, and Spiræa astilboides. But the Wistaria is, in this country, so seldom grown in standard form for the decoration of the conservatory that as here represented it has the air of novelty. Grown in seven-inch pots with a four feet stem, and freely flowered as in the case of the examples in the group, this elegant Chinese climber produces an effect of surpassing beauty, and at once attracts attention. To produce plants of this description is not a difficult matter, and knowing something of the enterprise of those engaged in commercial horticulture we have no doubt that were there to be a brisk demand for standards for flowering under glass abundant supplies would soon be forthcoming. A strong point in favour of the Wistaria is its flowering so early that it may be had in bloom in May without the assistance of artificial heat, and the aid it is thereby able to render those who have no accommodation for forcing flowering plants. Spiræa astilboides is one of the best of the hardy herbaceous plants with white flowers for decorative purposes during the spring months, but its merits are now so fully recognised that we need not say a word in its favour. The tree pæony, on the other hand, is not taken full advantage of in many gardens for enhancing the attractions of the conservatory during the spring season, and we would suggest that it be more generally employed for that purpose. We have now, as the result of the activity of raisers, so many beautiful varieties in cultivation, that there will be no difficulty in making a suitable selection, and under no conditions do they present a more pleasing appearance than when the flowers are developed under glass. This is a point of some importance, for the swelling buds are so susceptible to injury from spring frosts that in cold districts they frequently fail to bloom satisfactorily.



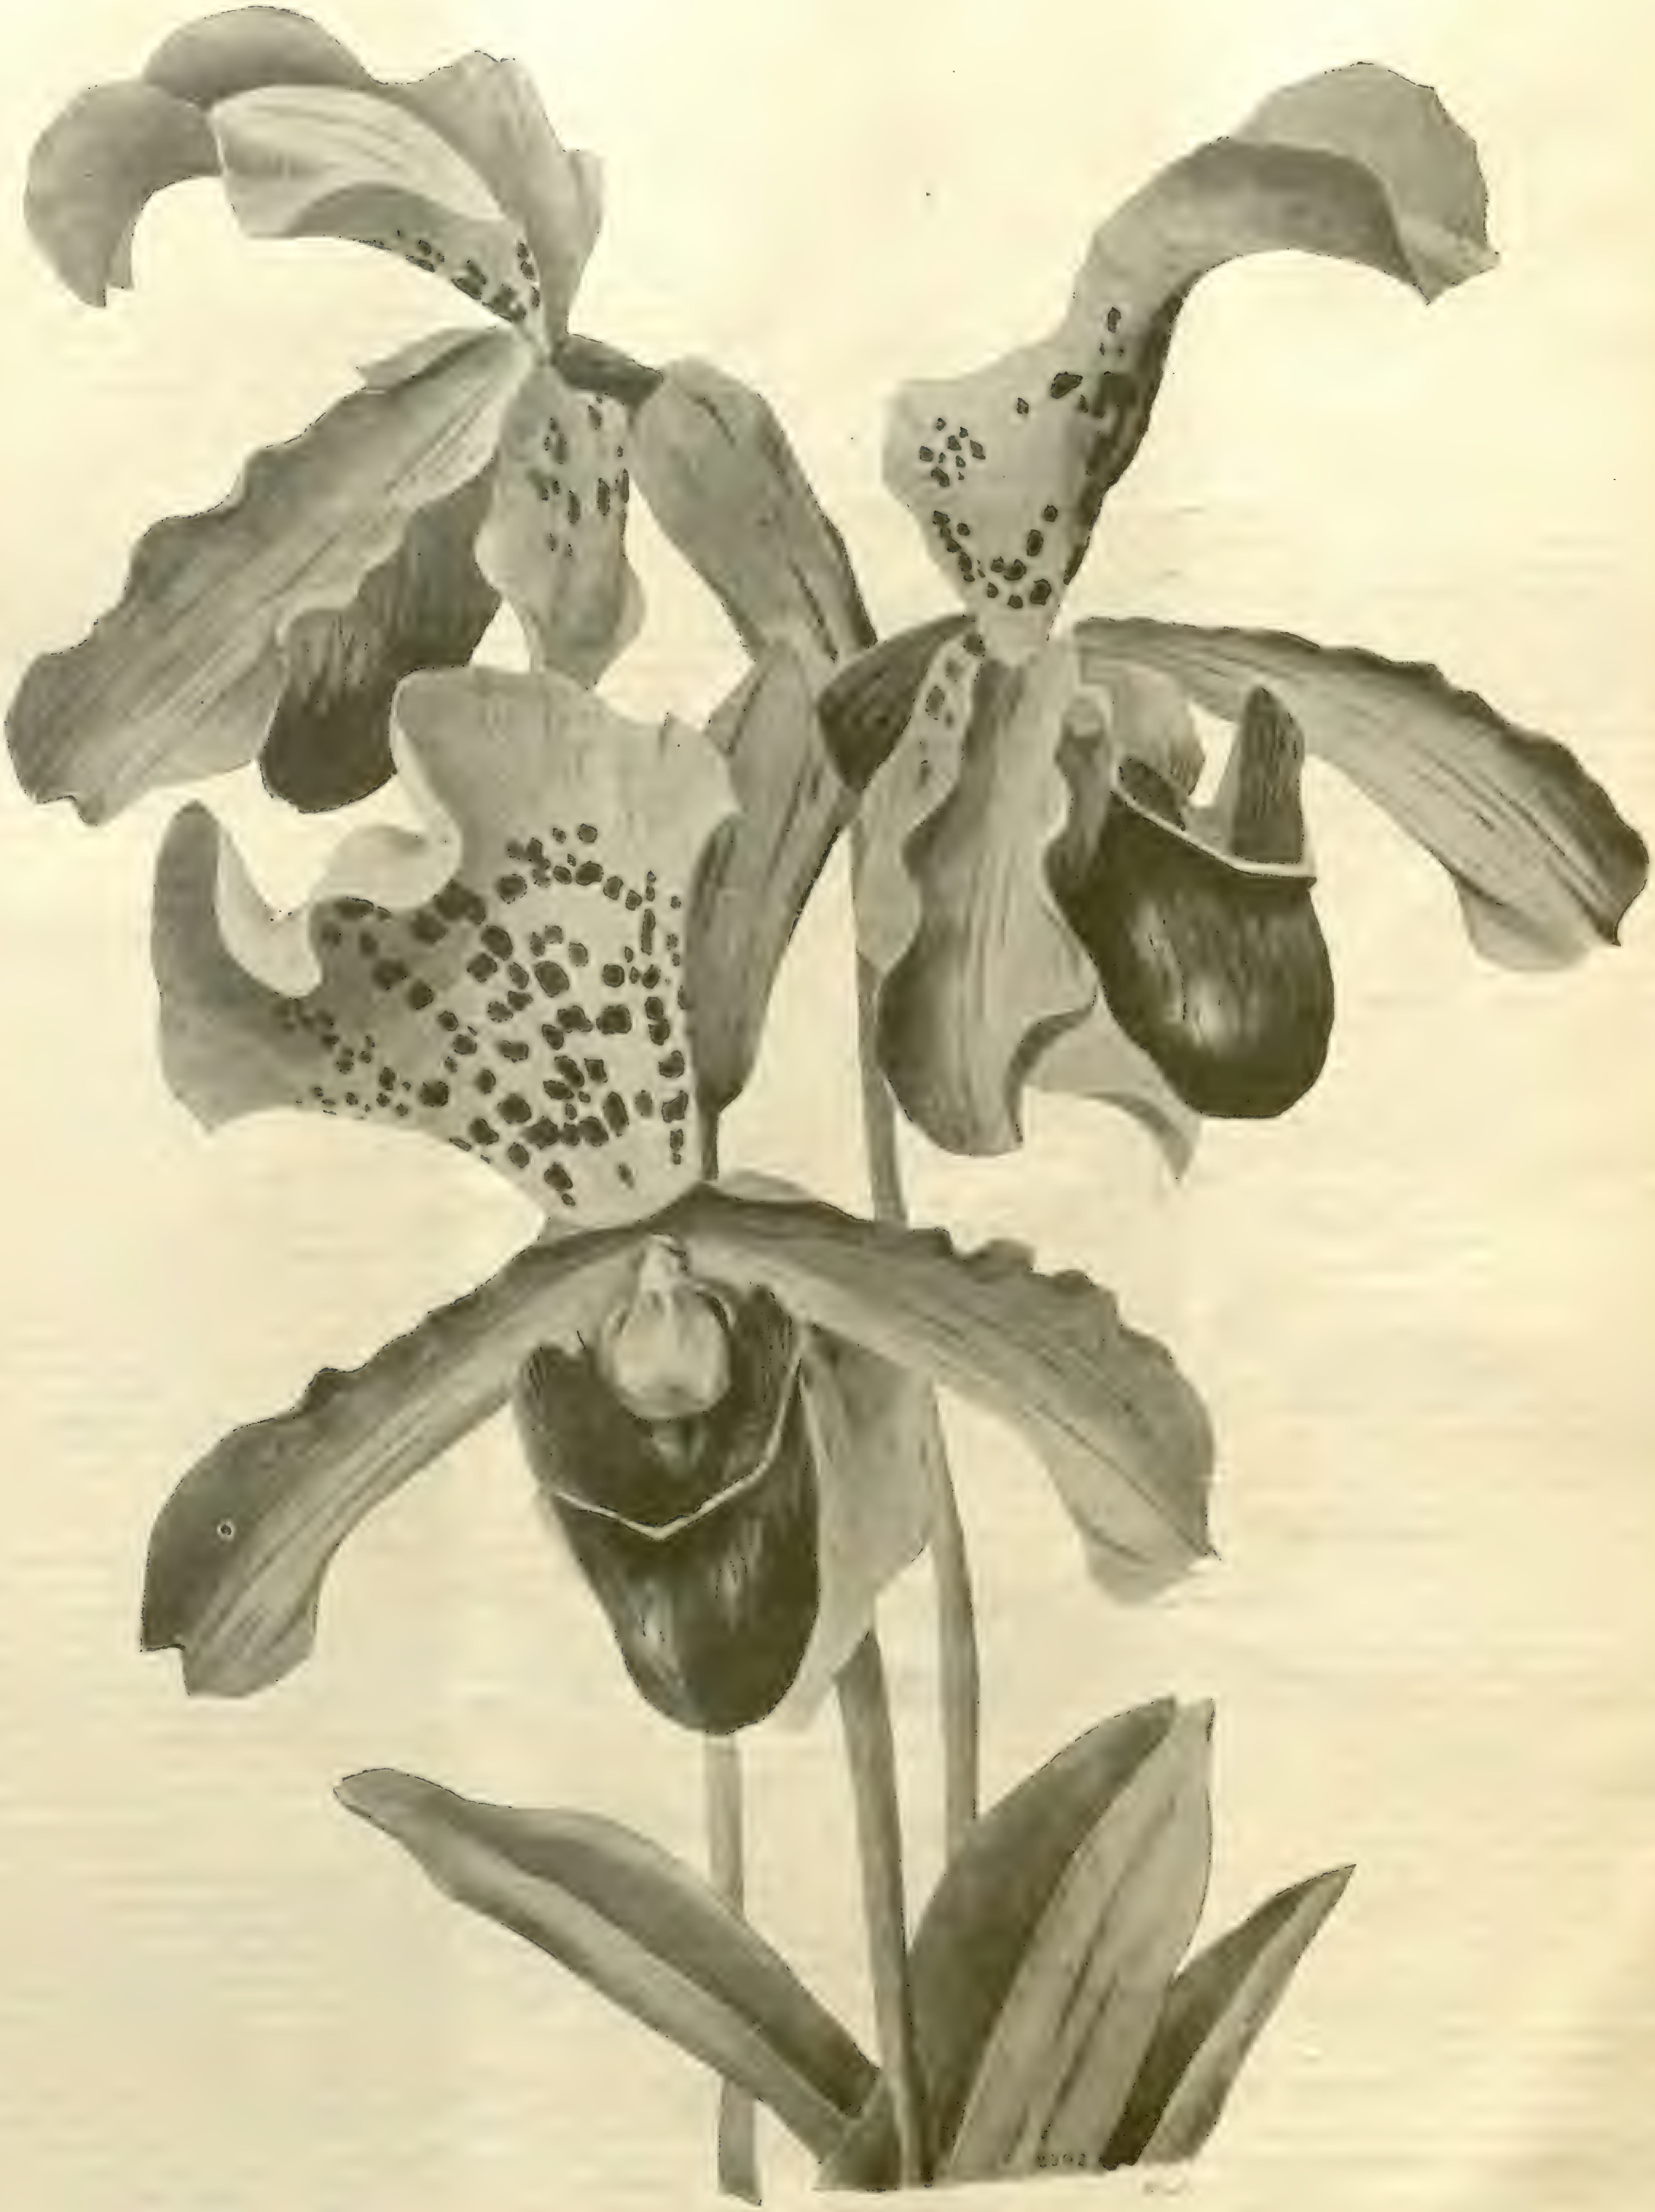
A PRETTY GROUP OF SPRING FLOWERING PLANTS.

Double Primula Marchioness of Exeter.—A few gardeners do this very fine double Chinese primrose well, and when well done it is the finest of all the section, without doubt, as the flowers are, on good plants, produced in great profusion during the winter, as large as those of hardy double primroses, and nearly all are pure white. For gathering singly to wire, and then work into bouquets, wreaths, &c., they are invaluable, and if grown for sale are most profitable. Amongst growers of these doubles I found, on recently walking in at Clandon Park, Guildford, that one of your readers, Mr. Blake, grows them remarkably well. His plants of the "Marchioness" in six-inch pots were very fine, and carrying large blooms profusely. He heaps sand well about the plants in February, just notches the bases of the side growths, soon roots them, and in that way obtains plenty of very robust plants.—A. D.

CYPRIPEDIUM INSIGNE, HAREFIELD HALL VARIETY.

As briefly recorded in our issue of the 17th inst. Mr. E. Ashworth, of Harefield Hall, Wilmslow, exhibited at the meeting of the Royal Horticultural Society held on the 13th inst. a remarkably handsome form of Cypripedium insigne, distinguished by the large size of its flowers, and of this we have now the pleasure of giving a characteristic illustration. As so admirably shown on the opposite page this magnificent variety is one of the largest of the several forms of this lady's slipper that have been introduced to public notice, and the finely flowered specimen submitted by Mr. Ashworth to the Orchid Committee presented a highly attractive appearance, and created much interest amongst the orchidists present. The flowers are borne on stout peduncles well above the foliage, and measure four and three-quarter inches from tip to tip of the petals and four and a half inches from the point of the slipper, or labellum, to the apex of the dorsal sepal. The latter is finely developed, measuring three inches in breadth, and the upper portion is pure white and the basal area is pale yellowish green, over which is strewn a number of large purple spots, a few of which extend upwards into the white apex. The ventral sepal is pale green, with a few purplish spots. The petals are pale green marked with darker green veins, and the labellum is very large, pale green, with dark green veins. The award of a first-class certificate is a sufficient proof that the Harefield Hall variety is regarded by orchidists of the highest eminence as a valuable addition to the long list of cypripediums which are cultivated and appreciated in British collections, and that it is a distinct and beautiful variation from the species, which enjoys a higher degree of popularity at the present time than at any period since its introduction seventy-six years ago, notwithstanding the multiplicity of beautiful lady's slippers now at the command of cultivators.

Bananas.—There can be no question that few fruits have more rapidly advanced in popularity in the British markets than the banana. Many hundreds of thousands of bunches of bananas are now sent to this country annually, and during the Christmas season the supplies were this year exceptionally large. The banana as a retail fruit is almost useless unless it is ripe. Many years ago, before this point received the attention it does now, one or two firms in Covent Garden Market owning underground cellars fitted up with heating apparatus to colour the fruit had the business entirely in their own hands. Then perfectly-coloured bananas made as much as 20s., 30s., and 40s. per bunch, and fortunes were realised. But the enormous supplies sent from the Canaries and Madeira have revolutionised the trade. During the past few days there has been a great scarcity of well-ripened bananas in the fruit shops, and the dealers who have cellars heated for the purpose of ripening the green bunches have crowded the heated chambers to meet the great demand for fruit in an advanced stage of maturity.



CYPRIPEDIUM INSIGNE, HAREFIELD HALL VARIETY.

REPORT ON ONIONS GROWN AT CHISWICK, 1897-98.

SIXTY-NINE stocks of onions were grown for trial in the gardens of the Royal Horticultural Society, and from the results given in the recent issue of the society's journal it appears the ground had been trenched and manured in July, 1897. The seed was sown in drills three feet apart on August 17, 1897. Early in March a row of each stock was transplanted one foot from the original row, and on March 18, 1898, another row was sown (out of the same packet as the autumn sowing), one foot from the transplanted row, so that the three rows of each stock were all one foot apart, viz., one (autumn sown) not transplanted, one (autumn sown) transplanted, and one spring sown. All the stocks germinated well, but the repeated dense fogs of the winter of 1897-98 made sad havoc with some of the varieties, while a few stood with little injury. The trial proved that many of the varieties usually sown in spring are fully as hardy for autumn sowing as the Tripoli type, when sown under exactly similar conditions; and, further, that the onion maggot will attack both autumn and spring sown plants. A few bulbs of each stock were infested by this pest, but an application of one ounce of sulphate of ammonia to each square yard checked the attack. In every case the transplanted autumn-sown bulbs were the largest and most shapely. The abbreviations are: F.C.C. = First Class Certificate; A.M. = Award of Merit.

1. *A* 1 (Sutton).—F.C.C. September 12, 1893. Very large, fine globe shape, skin pale brown. Excellent both from the autumn and spring sowings. Firm and heavy. A fine stock.

2, 3, 4, 5. *Ailsa Craig* (Watkins and Simpson, Hurst, Dobbie, Bowerman).—Very large, deep globe shape, skin dark brown. Firm and heavy. Very good from both autumn and spring sowings.

6. *Alaerton* (Sherman).—Very similar to Nos. 23, 24, 25.

7. *Anglo-Spanish* (Hurst).—Very similar to Nos. 51, 52.

8, 9. *Banbury Cross* (Nutting, Hurst).—A.M. September 6, 1898. Large, flattish globe-shape, skin lemon-brown. Very firm and heavy. Excellent from both autumn and spring sowings. Fine stocks.

10. *Bassano Red Tripoli* (Watkins and Simpson).—Large, flat round, skin pale purple. Many of the bulbs split into two or three. Better for autumn sowing.

11. *Bartella Silver Skin* (Hurst).—Small, flat round, skin silvery white. Of no value for autumn sowing, but very good for pickling when spring sown and not thinned out.

12, 13, 14. *Bedfordshire Champion* (Nutting, Watkins and Simpson, Hurst).—Medium size, globe-shape, skin deep brown. A firm heavy variety, more suited for spring than for autumn sowing.

15, 16. *Blood Red* (Hurst, Toogood).—Large, flat round, skin deep purple; moderately firm. Of not much value owing to the largest bulbs being very concave at the base; the best bulbs were produced from the spring sowing.

17, 18. *Cocoa-nut* (Watkins and Simpson, Hurst).—A.M. October 10, 1893. Large, cocoa-nut shape, skin brown. A remarkably fine heavy variety, equally good from both autumn and spring sowings.

19, 20. *Cranston's Excelsior* (Watkins and Simpson, Hurst).—Very large, deep globe-shape, skin dark brown. Firm, heavy; excellent either for autumn or spring sowing.

21. *Crimson Globe* (Dobbie).—Medium to large, deep globe shape, skin purple. Firm and heavy; the bulbs were much better from the spring-sown seed.

22. *Danvers' Yellow* (Watkins and Simpson).—Medium size, flattish globe, skin bronzy brown. Much better when spring-sown, the autumn-sown plants not standing the winter well.

23, 24, 25. *Eclipse* (Sutton, Dobbie).—Very large, flattish globe, skin pale brown. Firm and heavy; better from the spring sowings; the autumn-sown ones did not stand the winter well.

26. *Forde Defiance* (Crook).—Large, flat, round, skin deep brown. The spring-sown bulbs were the more shapely, many of the autumn-sown being concave at the base.

27. *Forde Long-keeping* (Crook).—An improved form of No. 22.

28, 29. *Giant Lemon Rocca* (J. Veitch, Watkins and Simpson).—Very large, deep globe-shape, skin lemon brown. A firm heavy variety, very good for autumn sowing, but of little value for spring sowing. Fine stock.

30. *Giant Rocca Brown* (Watkins and Simpson).—A darker skinned form of No. 28.

31. *Giant Rocca Tripoli* (J. Veitch).—A slightly inferior form of No. 28.

32, 33. *Giant Zittau* (Watkins and Simpson, Hurst).—F.C.C. 1880. Large, globe-shaped, skin bronzy brown. Firm and heavy; very good for spring sowing, but not so suitable for autumn sowing.

34. *Globe Tripoli* (J. Veitch).—Very large, globe-shaped; skin varying from brown to red. This variety stood the winter badly, and the spring sowing failed.

35. *Golden Ball* (Nutting).—Very similar in all points to Nos. 8 and 9.

36. *Golden Noble* (Dobbie).—Large, globe-shaped; skin brownish yellow. Firm and heavy; better when spring sown; did not stand the winter well.

37. *Golden Queen* (Hurst).—Not a success from either autumn or spring sowing.

38. *Golden Globe* (Hurst).—Large, globe shaped, skin a brownish yellow. Heavy and very firm; better for spring sowing, the autumn-sown not standing the winter well.

39. *Improved White Globe* (Sutton).—A paler and excellent form of No. 38, and like it better when spring-sown.

41. *Italian Tripoli* (J. Veitch).—A M. October 10, 1893. Medium to large, flat, round, skin silvery white. Unable to stand the winter, but excellent for spring sowing. Ripens very early.

42. *Magnum Bonum* (Hurst).—Large, globe shaped; skin a deep bronzy brown. Heavy and very firm; excellent for autumn or spring sowing.

43. *Monarch* (Toogood).—Bulbs large, flat round shape. Heavy and firm. Received too late for sowing in the autumn.

44. *New Golden Globe* (Toogood).—Same as No. 38.

45. *New Globe Winter* (Laxton).—Medium to large, globe shaped, skin deep brown. Heavy and firm; better from spring sowings, the autumn-sown not standing the winter well

46. *Nort Pale Red* (Hurst).—Large, flat, round, skin brownish red. Heavy; better when spring sown, as the bulbs from the autumn-sown seed split up during the summer.

47, 48. *Nuneham Park* (Nutting, Hurst).—A.M. September 6, 1898. Large, flat, round, skin brown. Heavy and firm, but many of the bulbs are slightly concave at the base. Very good for autumn or spring sowing.

49. *Prizewinner* (Palmer).—Very similar to Nos. 51, 52.

50. *Prizetaker* (Green).—A.M. October 10, 1893. Large, deep, globe-shaped, skin pale brown. Heavy and firm. The best bulbs were from spring sowings.

51, 52. *Rousham Park Hero* (Watkins and Simpson, Hurst).—A.M September 6, 1898. Large, globe-shaped, skin pale brown. Heavy and firm. Excellent for spring or autumn sowing. Fine stocks.

53. *Sandy Prize White Spanish* (Laxton).—Medium to large, flat, round, skin deep brown. Heavy and firm. Excellent for spring or autumn sowing.

54, 55. *Selected Red* (Dobbie).—Large, flat, round, skin deep purplish red. Heavy and firm. Equally good for autumn or spring sowing.

56 *Spanish Giant* (Toogood).—Large, deep globe-shape, skin dark brown. Heavy and firm. A very distinct variety with deep pea-green foliage. Ripens late. Seed received too late for autumn sowing.

57. *Southampton Champion* (Toogood).—Very similar to Nos. 61, 62.

58, 59. *The Queen* (J. Veitch, Hurst).—F.C.C. August 11, 1876. Same as No. 11.

60. *The Sutton Globe* (Sutton).—Very large, flattish globe-shape, skin deep brown. Heavy and very firm. Excellent for spring or autumn sowing.

61, 62. *The Wroxton* (Watkins and Simpson, Hurst).—A.M. September 6, 1898. Very large, deep globe shape, skin brown. An exceptionally heavy and firm variety. Excellent for spring or autumn sowing.

63. *The Wildsmith Exhibition* (R. Veitch).—Very similar to Nos. 61, 62.

64, 65. *Trebons* (Nutting, Hurst).—F.C.C. August 11, 1876. Very large, fine deep globe-shape, skin pale brown. An excellent, firm, and heavy variety. First-class for autumn sowing, not so good for spring sowing. Fine stocks.

66. *White Globe* (Hurst).—F.C.C. August 30, 1883. A paler and good form of No. 38.

67. *White Spanish or Port* (Hurst).—An inferior form of Nos. 51, 52.

68. *White Naples Tripoli* (J. Veitch).—Same as No. 41.

69. *Yellow Globe* (Hurst).—Same as No. 38.

COTONEASTERS.

FOR usefulness and effectiveness at all seasons of the year this handsome genus, comprising evergreen and deciduous shrubs, is held in great esteem. The extreme beauty and gracefulness of the best-known species, C. microphylla, was made very apparent to me recently at Guildford, where Mr. Selfe Leonard has planted it among the limestone rocks in his garden. In most instances the plants had formed beautiful hanging specimens, the rich and bright crimson berries presenting a fine contrast to the striking foliage. When seen under such conditions, or as a climber on a wall, this species is exceedingly effective. For the latter purpose it is far superior to the ivy, as its growth is very vigorous, yet neat, and soon it covers a large space. It is also better than ivy, because its shoots and leaves do not injure the wall or plants growing near. Another point in its favour is, that owing to its evergreen character and its berries remaining on the plants for a considerable time, it makes a distinct and very effective display through the dull winter months. When grafted on the common thorn or quince, as a standard, it forms a beautiful and interesting drooping tree for the shrubbery or border. It is of very easy culture, hardy, grows well in any good garden soil, and is not particular in respect to situation. Propagation is effected readily by means of cuttings taken in autumn, by layers made in summer, or by grafting, while it can also be raised from seed sown in spring. C. microphylla is a native of Nepaul, from whence it was introduced to British gardens in 1824.

Another noteworthy species is C. Simonsi (or C. nepalense of some authorities), a native of the Khasia Hills, and introduced from thence in 1868. Although not so useful as a climber as C. microphylla, it is exceedingly effective in the shrubbery border by reason of its upright growth, larger leaves, and bright scarlet berries of great size, abundantly produced, and very attractive. It can only be regarded as evergreen during mild winters or in very sheltered positions. The leaves are generally about an inch in length, orbicular-acuminate in shape, and glabrous on the upper surface. It is very vigorous in growth, and soon attains a large size when planted in good garden soil. Several fine specimens, averaging seven feet in height and several yards through, are very noticeable in Woking just now.

C. thymifolia is an interesting species by reason of its dwarf habit, it scarcely ever exceeding one foot in height. It forms a pretty evergreen shrub, with crowded branches, bearing small pinkish flowers in April, succeeded later by scarlet fruits. For the rockery or front row of the shrubbery it is exceedingly valuable, and is easily grown in ordinary soil. A form of this species, known as C. thymifolia congesta, differs in having white flowers, congested branches of pale green, obovate leaves, and globose scarlet fruits. As seen at Guildford, its growth is almost creeping or resting on the stones, which renders it a fine and useful plant for the rockery. Although not introduced to British gardens until 1868 from the Western Himalayas, it had previously been described by Maund in "The Botanist," published in 1839.

Another useful species which is of recent introduction is the Chinese C. horizontalis. As yet but little known, it is very valuable for its freedom of growth and the striking appearance of its leaves. These are evergreen in character, and spread in almost sail-like fashion. Its flowers, although small, are of a rosy pink shade, while its berries are a brilliant orange-scarlet. For the rockery or border it will be highly esteemed, as it quickly covers a large space, and is very ornamental either in foliage or fruit.

Among the better known species which deserve passing notice, although often seen in our gardens, may be mentioned C. frigida, which grows to a height of from eight to ten feet. This has crimson berries, and is very ornamental. C. buxifolia, from Nepaul, grows from three to four feet high, and has crimson fruits and neat evergreen leaves; it is well worth growing. The British species, C. vulgaris, described by Hooker as being very rare, is very variable; it is deciduous in character, forming a shrub from three to five feet in height. Several of its forms have scarlet or crimson berries, and there is one with black fruits. All are frequently seen under cultivation, and are well worth notice as useful and very ornamental shrubs of easy culture.

Woking. E. SCAPLEHORN.

THE PEAR MIDGE.

THE injury caused by this insect is gradually increasing, and has, according to the Journal of the Board of Agriculture, been very serious this year in various places, reducing the crop of pears, which was already short on account of the unfavourable weather at the time of the "setting" of the fruit. Some pear growers seeing the young pears falling fast in June, when they are about the size of marbles, think that this drop is due to an unhealthy condition of the tree, or to influences of weather, but it is more often due to the insidious and dangerous action of the tiny pear midge, the presence of which is far more common than is usually believed. But this mischievous insect is becoming more generally known, and there have never been so many complaints concerning it in any previous season. In most instances the cause of the disorder was recognised, and remedies and modes of prevention only were asked for. In a few cases, where all the larvæ had left the pears, and there were no indications of insect attack, inquiries were made as to the source of the injury.

An experienced and successful cultivator of pears, whose crops had been regularly destroyed by this midge, wrote that he feared it would be quite impossible to grow pears in his neighbourhood unless some cure were found. He added that his crop of the pear known as Beurré de l'Assomption was only two pears, although there was a splendid "set," and that in the previous year there was no fruit at all on these trees. Another grower said that he had seventy bush pear trees on quince stocks, and had picked off 2,000 infested pears from them; he had standards close by with infested fruit, but he could not hand-pick these. The infested trees were mainly of the sort named Williams' Bon Chrétien.

It would appear that early pears, and those that blossom early, are most liable to this infestation. Williams' Bon Chrétien is notoriously subject to it, and in America, where the pear midge is very prevalent and most destructive, the Bartlett pear (identical with Williams' Bon Chrétien) is chiefly attacked. Beurré de l'Assomption, earlier than Williams' Bon Chrétien, is also frequently seriously affected. Pitmaston Duchess, Marie Louise, Jargonelle, Souvenir du Congrès, all early, and like the Bon Chrétien in many respects, are also especially liable to be infested. Infestation has been noticed on later pears, as Josephine de Malines and Catillac, but in a much less degree than on earlier varieties. Only forty yards distant from the pear orchard last alluded to was another containing sixty trees of Durondeau and sixty of Louise Bonne of Jersey, which were quite free from the attack. Louise Bonne of Jersey, although fairly early, is not quite so early as Williams' Bon Chrétien.

In America the Bartlett and the Lawrence are the varieties most commonly attacked, and it is said that in some districts there has lately been a loss of almost all the Lawrence pears, and a large proportion of the Bartletts, the attacks being so serious and frequent that growers in these localities speak of abandoning pear culture altogether. Professor Riley, writing in 1885, considered that the insect had been imported from Europe, as until it was found in 1880, upon a certain farm near Meriden, in Connecticut, no insect of similar habits was known in the United States.

There is no doubt that it is the same insect as that termed *Cecidomyia nigra* by Meigen. This is affirmed by Schmidberger, who first described the habits of this insect in 1831. He says: "The species of gall-midges found by me in the pears are evidently the *Cecidomyia nigra*, because the description which Meigen gives of the black gall-midge completely agrees with this. I retain Meigen's name, and call it the black gall-midge." Riley, however, suggested that the name of *Diplosis pyrivora* would be more suitable, and this has been adopted by dipterists. It is not known how long it has been at work in this country. It was first mentioned twenty-five years ago, and there is every reason to believe that it had been present here long before this, for its action upon pears, as pointed out above, closely resembles that of weather and other natural causes, and might easily have been mistaken for these, especially as there were then comparatively few trained observers.

Life History.

The fly is nearly one-tenth of an inch long, with an expanse of wings equal to close upon one-fifth of an inch. Its slender body is dark grey, approaching black, in colour; its antennæ, with twenty-six joints in the male, are brown and very long; its legs are also very long, and yellowish brown. The female is slightly longer than the male, having antennæ with fourteen joints, and an exceedingly long ovipositor for the purpose of depositing her eggs in the calyces of the blossoms of the pears. Schmidberger witnessed the process of egg-laying, and describes it as follows: "I found the first gall-midge in the act of laying its eggs in the blossom; this was on April 12. It had fixed itself almost perpendicularly in the middle of a single blossom, and having pierced the petal with its long ovipositor, it laid its eggs on the anther of the still closed blossom. This female was about seven and a-half minutes laying her eggs. When she had flown away, I cut the pierced bud in two, and found the eggs lying in a heap one upon another on the anthers. They were white, longish, pointed on one side, and transparent, and from ten to twelve in number. I afterwards found several midges engaged in laying their eggs as late as April 18, from which day they ceased to appear in the garden. I also saw a midge on the side of the blossom with its ovipositor inserted in it, so that they do not merely pierce the petals, but the calyx also."

The number of eggs, according to Schmidberger, varies from a few to more than twenty. They are hatched in a very short time if the weather is warm. Schmidberger found small larvæ on the fourth day after the deposition of the eggs, which begin to bore into the blossom usually in or near the stem of the calyx. "Before the blossom is expanded they descend to the core, so that they may not be exposed to the sun's rays, which would endanger their existence. They separate at the core, and begin to devour it on all sides. When they have consumed the pulp of the small fruit they have attained their full size, and only await for a favourable opportunity to leave their still secure dwelling." Sometimes they fall from the pears to the ground; sometimes they fall with the infested pears, from which they emerge and bury themselves in the earth to a depth not exceeding one inch. The larva is endowed with powers of jumping like other species of *Diplosis*. It can also crawl well, but it has no legs. It is rather more than a twelfth of an inch long. In colour it is whitish yellow, becoming rather darker as it gets older. It has what is known as the "anchor process" or "breast bone," which serves as an adjunct to the mouth in biting pulp and tissues, "broadly dilated," as remarked by Professor Riley. This is light brown in colour, bifurcate in shape, and is easily seen with an inch lens. It is not known when the pupal state is assumed. It has been ascertained that the larvæ remain for some time in larval condition before commencing their cocoons, and that they remain, according to Riley, in the cocoons for some time before being transformed to pupæ. The pupa is about one-tenth of an inch long, black above and yellowish brown beneath.

Methods of Prevention and Remedies.

It is absolutely certain that the author of this mischief to the pear crop is lying just under the pear trees from June until the end of March, and only about an inch below the surface of the ground. It may therefore be assumed that thoroughly digging the ground beneath the boughs of the pear tree, making allowance for the skipping or jumping habits of the larvæ as they come from the pears, will bury the larvæ so that the flies cannot emerge. This should be done as a means of prevention where possible. It would be necessary to dig the ground with digging "spuds" so as to completely turn it over, and the action of winter rains and frosts would pulverise it and make it compact, and thus prevent the flies getting through the clods. Obviously this could not be done in grass orchards. Dr. J. B. Smith, who has closely investigated this subject, says "ploughing an orchard" (and ploughing is a frequent mode of cultivating orchards in America) "infested by the midge, after the middle of June, or, in fact, at any time during the summer, so as to turn the soil at least four inches, will probably result in burying beyond resurrection a great proportion of the midges." Ploughing is not adopted in England, but many orchards are dug, and in gardens it would be easy to adopt this practice. Dr. Smith, who has made careful experiments in connection with the pear midge, has also found that dressings of kainit immediately under infested trees have been most effectual in killing the larvæ. He recommends that the ground under the trees should be top-dressed with one ton of kainit per acre, and mentions an instance of an orchard thus treated, of which the fruit practically escaped infestation, while in an adjoining orchard not treated he failed to find a single fruit that was not infested with larvæ. This treatment has been successfully adopted by several pear growers. The kainit should be put on between the middle and end of June, before or immediately after rain. It is also suggested that ploughing or digging might advantageously follow towards the end of July or in August. Where pear trees are in grass orchards the grass should be cut very close before the kainit is put on. It is desirable to apply the kainit before the larvæ get into cocoons, as it has much more effect upon them in their naked state. Rain, or the moisture of the atmosphere, causes the kainit to dissolve slowly and the caustic solution thus formed burns the tender bodies of the larvæ that are within its influence.

With respect to actual remedies it must be said that they are few and not satisfactory. Spraying with insecticides is of no avail. Spraying with offensive materials, as paraffin or carbolic acid, might prevent egg laying if done just at the right moment. Dr. Lintner suggests sacrificing the Lawrence pear crop by spraying Lawrence trees with London purple just after the fruit is formed in order to kill midges and starve the larvæ within them. But, unfortunately, other pear trees are liable to infestation, and in England it would be more difficult to select the trees most subject to this attack for this purpose. Picking off and burning infested fruit can be adopted in the case of small bush, espalier, wall trees, and even half-standards; but it could not be done on standards. As a rule, infested pears can be recognised by their malformation, so that it would be easy, after the pickers were instructed, to pick them off and leave the sound pears.

DO CHRYSANTHEMUMS WEAR OUT?

IT would not be to the advancement of chrysanthemum culture to let the opinion pass that, after all, the continuous demand for new varieties may have its origin in a frivolous desire to be in the fashion. The fact of good, new varieties being in the market would not justify cultivators in changing old for new. Practical growers have not usually done so with other popular flowers, unless under pressure of some new and increasing demand, and this would hardly apply in the case of chrysanthemums, for it is not the decorative so much as the large show varieties that are in question. Experience has taught us that to keep anything like an up-to-date exhibition collection we must discard old favourites, and fill their places with new; this is necessary as a set-off against the continuous strain made on the large-flowering varieties, for these giants are more or less freaks brought about by high culture and artificial treatment, and so cannot be expected to reproduce their abnormally gigantic proportions for any great length of time. There are no exemptions from this wearing out amongst the large-bloomed varieties in all the different classes. Of course, the Japanese have their ranks filled up much better than the others, yet even among these (from the exhibitor's point of view) we have no coloured ones to surpass for size of bloom The Sultan, Comtesse de Beauregard, Baron de Prailly, Triomphe de la Rue des Chatalet, Meg Merrilies, Ralph Brocklebank, Carew Underwood, Margaret Marrouch, Boule d'Or, and Madame C. Audiguier of ten years ago.

The incurved varieties were in their hey-day six or eight years ago, but since then we have seen Prince Alfred, Lord Wolseley, M. Bahuant, John Salter, Mrs. R. King, Nil Desperandum, and many others go down. The Queen family that bowled out Jardin des Plants, The Beverleys, Mr. Bunn, Geo. Glenny, Mrs. Dixon, Mr. Gladstone, Mrs. Halliburton, &c., are in their turn giving way. Then in the Japanese anemone class we have had to part with Madame Cabrol, Fabian de Madanarey, Sœur Dorothé Sœull, and many others. Cramming and crowding may hasten decline, and most growers have their plants too crowded in November; yet I believe that even if we gave up rank culture and ceased the introduction of new sorts we should have few very large bloomers in eight or ten years' time. Consequently we must continue to welcome new varieties from every quarter, for there will be no relaxation of the high culture or the production of more vital force than the flower needs.

Nortonthorpe Hall, Huddersfield. A. FINNIE.

Crimson Chrysanthemums.—After seeing the novelties of the past two or three seasons, but particularly those of 1898, I cannot help wondering how many of the present-day cultivators there are who can recall to mind the varieties we used to call crimson nearly twenty years ago. In the incurves there are absolutely nothing worth the name of a crimson. Among reflexed we had King of the Crimsons, the old but very small Julie Lagravère, a little later Cullingfordi, and in the Japanese but a very few that could be considered of that colour; but now how brilliant are some of the crimsons, thanks to the unceasing efforts of the raisers. Mr. W. Seward's name certainly deserves a special mention in connection with this colour, for his acquisitions are beyond question some of the best. The very dazzling crimson H. J. Jones shown at one of the latest meetings of the N.C.S. Floral Committee has outdistanced every other novelty of that shade, which will make it a welcome addition not only on the show-board but also in groups for decoration. Very fine, too, in their various tones of this once much-needed colour are Joseph Chamberlain, Owen's Memorial, Lord Cromer, Royal Standard, Master H. Tucker, all Japanese, and Emile Nonin of the old incurved type. Apart from these there are many others closely bordering on the crimson, but which are properly described as reddish-bronze and warm golden terra-cotta colours, that have been also greatly improved and intensified by the raisers, both at home and abroad, during the past few years.—C. H. P.

WORK FOR THE WEEK.

WARM ORCHIDS.

Flowers of all descriptions will be at the present time very useful in every household, more especially those of orchids; the commonest of them will be highly appreciated, they being preferred to the ordinary garden flowers, and give a sort of aristocratic appearance in vases and other varieties of ornaments used for this purpose at the present period. Orchids of all descriptions are far better (as all experienced growers know) to be in bloom as near their natural time of flowering as possible. It is a well-known fact that thousands of valuable plants have suffered fatally owing to their being overdone by forcing too much, otherwise being retarded at too low a temperature, all through the flowers from them being required at some unnatural time. It would be well at the present time if all growers would make notes of what species and varieties flowered at this season as a guide for another year, independent of much forcing or retarding; it is much better to observe these petty (still important) things among our private collections, in order to gain a fair knowledge of them, which is sure to be useful in years to come. Cattleya Percivaliana, named in honour of Mr. Percival, of Southport, one of our early lovers of orchids and possessing a very large collection, comprising some of the choicest things in their day, will be now contributing to our displays that we have at this time of the year. The white form, which is almost out of existence, would be a great boon, and if it could be found in quantities it would be keenly searched for. Cattleya Trianæ is fast pushing its way through the sheaths; it would be well to place this variety at the warm end of the house, as in this state it requires a shade more heat. Some of the selenipediums and cypripediums are also making a display; these also will require to be kept in a drier state at the roots, in fact the former are far better kept on the dry side at all times, providing a genial temperature is always kept. C. bellatulum must be kept very dry; a good criterion to know when they require water in the winter months is to guard against the foliage going flaggy, only allowing it to get in a certain state. Of course, this depends mostly upon the surrounding conditions as to whether the structures are new or old, and whether lofty or low, and many other simple reasons why they should be carefully watched discreetly; some of the hybrids resulting from bellatulum and niveum are also very critical. Many times a plant may be in the best of condition, and in luxuriant health (as it were), and perhaps in the course of a few weeks, to the horror of the grower, it begins to get a few black spots about the growths, which, if not guarded against in due time, ultimately prove fatal; when this occurs it is well to take a small penknife and cut all the decay thoroughly out, and after doing so rub the wound well over with dry sulphur, and keep the plant thoroughly dry; a good plan is to suspend anything of this kind, and dip the lower portion of the pot or pan until the plant gets something like being in a fair way of health again.—T. Stafford, *Tyntesfield Gardens.*

STOVE PLANTS.

Begonias of the manicata type are now throwing up their flower stems, and should receive stimulants regularly; the best of these are very useful to all who have flowers to supply in quantity during January, February, and March. The individual plants should stand so that they do not touch their neighbours, and when watering be careful not to wet the foliage, else damping of the leaves will occur; on well-grown plants the leaves should quite hide the pot. B. manicata is the first to open its flowers, followed by B. hydrocotylifolia, this again succeeded by B. heracleifolia nigricans, the latter bearing larger individual flowers on its long-stemmed cymes but not produced in such abundance as the two first mentioned. Begonias corallina, President Carnot, Haageana, Knowsleyana, insignis, multiflora, Gloire de Lorraine, and others have been affording flowers in quantity for some weeks, and will continue if given good treatment and a position in a house with a moderately dry atmosphere and a night temperature of 50 degrees to 55 degrees. Where flowers are required in quantity during the winter months goodly numbers of each of the above-mentioned begonias are indispensable.

Other plants in flower in the stove at this season are eucharis, Jasminum Sambac, rondeletia, aphelandra, Thyrsacanthus rutilans, Plumbago rosea, poinsettias, euphorbias, gardenias, and a few others, including late started plants of allamanda; we find the latter very useful thus late in the year for the purpose of associating with gold plate on the dinner table. Some people complain that allamanda flowers do not last when cut, but if besides placing the stem in water a little is poured into the cup it will enhance their keeping properties.

Asclepias curassavica is a useful flowering plant at this season grown in the intermediate house; we find it extremely valuable for buttonhole bouquets, especially for gentlemen. The work in these structures will now be purely routine, such as introducing flowering plants to bring them on in succession, sponging and dipping plants infested with insect pests. A few of the earliest rested tubers of caladiums may now be started, potting the tubers singly into small pots in cocoa-nut fibre and sharp sand, plunging the pots in bottom heat; they will not require much water at the root, but may be syringed overhead two or three times a day. Introduce a few more gloxinias to heat, these will afford flowers useful to send to the family when in London. The flowers of these carry extremely well if carefully packed.

Stems of leafless dracænas should be cut up into lengths of about an inch; split them in half lengthways and insert over the surface of pans containing peat and sand or leaf-soil and sand. If a position cannot be afforded them in the propagating case, place a pane of glass over them, and stand the pans over the evaporating troughs. Be careful they do not become too dry, and on the other hand do not supply them too lavishly with water.

Keep all evergreen stove plants moderately moist, so that they may rest without losing their leaves; if they be kept too dry for a time and then watered regularly it will tend to start them into growth, which is to be avoided so early in the season. A night temperature of 60 degrees to 65 degrees with 5 degrees rise from fire heat will suffice in the stove at this season, the intermediate house may range from 5 degrees to 8 degrees lower. If it has not already been attended to, a quantity of loam, leaf-soil, burnt refuse, and other ingredients used in potting should be placed under cover, so that it may be available when required. During frosty weather, when the surface of the ground is just slightly hardened by frost, is the best time for cutting turf for potting purposes where wireworm is prevalent in the land from which the turf is taken. When bad weather prevails have all empty pots washed, stakes overhauled and placed in sizes, and crocks washed and sorted, so that when the busy season comes round all may be in readiness, and no time lost by having to make preparations that could have been more conveniently done weeks before. —J. Tunnington, *Ripley Castle Gardens, Yorks.*

THE FLOWER GARDEN.

The weather having up to the present remained exceptionally mild bulbous subjects, as narcissus in many varieties and some others, are making unusual progress, several varieties being already well above ground. In anticipation of frost setting in these may advisedly receive some protection, as a slight mulch of cocoa-nut fibre refuse, old mushroom bed manure, or similar light covering. Beds of carnations planted some time since may be treated in the same manner, old mushroom manure being a very good material for using about these plants. As they are liable to be lifted out of the ground or partially so by frost, a little covering of this description will act as a preventive, and at the same time a slight stimulant to the eventual growth of the plants. Clumps of Helleborus niger, now fast opening their blossoms, should also be given some protection. Single clumps may be covered with hand-lights or frames, and lights placed over those where several together on beds are to be covered, affording air or removing the lights when the weather is neither frosty nor wet. If glass is not available any temporary shelter may be improvised, oak branches with the dry leaves still adhering being a good one, and these may remain constantly over them. The season has been most favourable for all planting operations, and very little check has been experienced for this work either from wet or frost up to the present, and at the time of writing the weather is quite favourable for the continuance of planting roses, trees, and shrubs; and where such work is unfinished advantage should be taken of the open weather to make as much progress as possible while it lasts. A mulch of some half-rotten material should be given before the ground becomes frozen.

Cuttings of bedding calceolarias, violas, pentstemons, antirrhinums, and other subjects struck in late autumn in cold frames should have a free circulation of air about them when the weather allows, and all decaying leaves be promptly removed. Owing to the mild weather these plants have made considerable growth, and many of the calceolarias, pentstemons, and antirrhinums already need the leading points pinched out. Should frost set in the sides of the frames must have ashes, bracken, or other material banked up round them, and the lights covered with mats or litter. A somewhat similar treatment is required for violets in frames. Particular care should be given in the ventilation of these, and the lights be kept entirely off or well tilted, excepting in frosty weather. More harm is likely to be the result from undue coddling than if left entirely exposed to all weathers. Both double and single varieties are blooming freely up to the present. Bedding pelargoniums will require little water during the short winter days, especially if wintered in a cool greenhouse. Damp is the worst enemy, and a little heat should be circulated in the hot-water pipes to dry up moisture occasionally in the daytime, admitting plenty of air at the same time. With the lengthening of the days varieties of which the stock is below the required quantity may be placed in a temperature of 55 degrees to 60 degrees for the production of growth for cuttings later on.

Fuchsia cuttings struck in autumn should by this time be well-rooted, and where desired to grow on into strong plants by bedding-time should now be potted off singly into sixty-sized pots, using rather light sandy soil for the purpose. Stand near the glass and keep them growing on in an intermediate or stove temperature.

In anticipation of bad weather soils should be prepared for the propagation and potting of various bedding and other plants, and placed under cover to be in readiness when required for use, and when outside work is impossible all dirty pots should be washed and stored in their various sizes, crocks broken, sifted into different sizes and stored in bins, stakes trimmed and pointed, pegs made for layering, &c. Lawn mowers, if not already stored, should be thoroughly cleansed and put away in a dry place, and any needing repair be sent to the makers now, so as to ensure their being in readiness when required again for use. After cleaning up lawns should be given an occasional rolling while the mild weather continues. —C. Herrin, *Dropmore.*

HARDY FRUITS.

There is no better time than the present to feed fruit trees needing assistance, and in the case of bush or pyramid trees on the paradise stock food is a necessity. Many trees in their earlier stages are ruined by excess of food at a time it is not needed, but if given in the form of surface dressings after they come into bearing it is beneficial. Many trees receive the best of treatment at the commencement, and are afterwards left to themselves. Trees on grass in orchards are often seen starved, and here food may be given in the shape of well-decayed manure, and for other trees, if manures cannot be spared, surface dressings may with advantage be given, and such aids as road cuttings of turf, burnt refuse, wood ashes, and bone meal mixed, will make a good top-dressing for the trees. Prunings and other waste materials if burnt are useful to add to the soil, and I have found this with spent mushroom manure and wood ashes an excellent fertiliser. It may happen liquid manure is running to waste, and this may be given to fruit trees if the soil is given a good surface dressing before applying the liquid, so that the latter reaches the roots. I have touched upon the necessity of manuring the bush and larger trees, but there is equal necessity, if not more so, on behalf of such trees as the gooseberry, currant, and other smaller fruits; the gooseberry repays liberal treatment, and a good mulch of decayed manure is most beneficial. Raspberries may now be trimmed and the shoots tied up, cutting away any weak growth. We summer prune our canes; this leaves little work at this season if the old fruiting canes are cut out when the crop is cleared. I am a strong advocate of mulching these fruits in light soils, as they root near the surface. This should not be overlooked at this season, as I find, if left too late, at times these plants are overlooked. Strawberry plants made this year a late growth, and I notice the quarters are more troubled with weeds than usual. Here the hoe must be used between the rows, but not in a way that the roots are loosened; indeed, in the case of young plants, previous to hoeing, it will be well to make the soil firm by treading round each.

The pruning of orchard standard trees will now need attention, as I find there is no better time than the present. By pruning it must not be understood I mean severe cutting back, as with old trees this is not advisable; much better results will follow thinning out, and it may not be out of place to refer to the waste of time in keeping old, worn out, cankered trees. These do not benefit by pruning, though I have seen severe measures taken to bring such trees into a bearing state. Thinning out and removal of cross branches will be the necessary work with standard trees, and, if possible, avoid cutting away much growth at one time. It is far better to prune annually than leave alone for years and cutting away a great deal of wood at once. The centres of trees should be left open to admit light to the inner wood, but no one need hesitate to cut out poor growth. All kinds of bush apple and pears should be pruned, and in the case of old trees inclined to produce small fruits good results will follow removal of crowded spur-growth, and especially with pears, and by thinning more light will be admitted. Very old spurs that are some distance from the base may be shortened, care being taken to leave a wood bud for a new break and form new fruit buds later. Weak and spray growths should be cut clean away; these are not needed, and to leave eyes or buds will only induce a fresh break of useless wood. Leading shoots of apples or pears may be shortened to within three inches if the trees are full-sized and extension is not needed; but it is well to remember by continual cutting in of shoots, and giving roots free play, there will be little fruit as the trees become older.—G. Wythes, *Syon Gardens.*

COLD STORAGE OF FRUIT.

The Technical Education Committee of the Kent County Council appointed some time since a sub-committee for the consideration of the subject of cold storage as applicable to the preservation of fruit and vegetables, and this sub-committee consisted of Mr. E. Hesketh (chairman), Mr. W. W. Berry, Mr. W. Chambers, Mr. R. Mercer, and Mr. A. T. Waring.

At a recent meeting the committee, in view of the great and growing importance of the question of cold storage, resolved that the valuable interim report of their superintendent of horticulture, Mr. W. P. Wright, upon the experiments conducted by the sub-committee at Messrs. Hall's Engineering Works, Dartford (through the kind interest of Mr. Hesketh), should receive the fullest publicity, and in accordance with such resolution this report has been sent to us for publication, and is given herewith :—

A courteous intimation from Mr. Everard Hesketh, received in July last, that the experiments in the cold storage of fruit, which had been necessarily suspended during last year, had been resumed, was received by me with much interest. Mr. Hesketh's letter was prompted by his kind recollection of the fact that I had derived much pleasure from a chance visit many months previously, and by his correct assumption that any important step bearing on a great industry, with which I was professionally connected, would command my attention. I gladly availed myself of his invitation to pay an early visit to the works, and as my call coincided with an impending meeting of the committee I drew up, at his request, a brief report of what I saw. The immediate result of this was the reception of your instructions to pay weekly visits to the cold chambers with a view to regular reports stage by stage. The duty thus laid upon me I have striven to fulfil carefully and faithfully, paying due regard to the desirability of giving minute attention to detail, and to the imperative necessity of setting down with the utmost accuracy the exact condition of the fruit as I saw it from week to week.

My conception of the first requirement of the task which you entrusted to me was that I must approach it with a mind absolutely free from prejudice either for or against the work in hand, and this seemed to me the more pre-eminent from the magnitude of the issues at stake. As I understand your object in these experiments, it is to ascertain whether any practical means exist for assisting British cultivators to secure a portion, at least, of the millions which we expend on foreign fruit and other soil products. Above everything, therefore, all tests, and all records of such tests, must be governed by one consideration alone—accuracy and truth. Whether, therefore, the facts noted are or are not in consonance with the trend of your endeavours, I have held it my duty to set them down, so that those interested may not on the one hand suffer from the lack of useful information, nor on the other be misled by careless or partial observations.

The Cold Chambers.—These number three. Their base is on the ground level of the buildings, and glazed apertures are provided there for reading the thermometers, which are suspended within, the temperatures being thus recorded without any opening to the outside air. An entry, however, can only be effected by means of trap-doors, kept locked, in the floor of the loft above. Internally the arrangements are simple, but adequate. A series of staging, tier above tier, consisting of wire shelves, supported by a wooden framework, is erected on each side of a central path. The walls, floors, and ceilings are well insulated, and in each chamber, close to the insulated walls, are two brine walls or flat tanks, through which the cold brine is circulated, and by their means the temperature is lowered to any desired degree. There are spaces for the circulation of air at the front and back of the brine walls, and a trough is fixed under each to convey moisture condensing on them to a collecting pan.

The Experiments.—In each chamber the fruit is stored under three different conditions : (1) exposed on the shelves ; (2) enveloped in grease-proof paper ; (3) surrounded or covered by cotton-wool. The last two conditions are supplied with a view to checking the loss of weight from the fruit by evaporation, which it was anticipated would take place. The increased weight of the air of the chambers as it is cooled by contact with the cold brine walls causes a downward current over them, and, of course, a corresponding upward current at other parts of the chambers. There is, therefore, a constant circulation of air maintained. These incessant air currents passing over the surface of the fruit extract moisture from it, and hence the use of the interposing materials to check this.

Strawberries —In dealing with the different fruits experimented with I will first of all take the strawberry. It was nearly at the end of the season of this fruit, namely, on July 23, when my visits began. I could, therefore, only report on fruit placed in previously. The temperature of No. 1 chamber was maintained at 42 degrees, of No. 2 at 36 degrees, and of No. 3 at 30 degrees. I found a very striking difference in the condition of the fruit, all of which had been put in a fortnight before, namely, on July 8. That in No. 1 was mouldy, although the fruit enclosed in paper was hardly so bad as that exposed and that in wool. About the fruit in No. 2 my remarks were : "Exposed fruit a little mouldy, but not so bad as in No. 1 ; wool fruit slightly affected, but very little, flavour good ; paper fruit sound, flavour good." With regard to No. 3, the state of affairs was better. In each experiment the fruit was quite sound and good. It was not frozen, in spite of the temperature of 30 degrees, but a slight toughness of the flesh was observable. The exposed fruit, though sound, was dull and had a glazed appearance. That in paper was good and fresh. Weekly visits were subsequently paid. So far as the highest temperature was concerned the experiment was at an end, as the fruit was spoiled. The intermediate temperature gave little better results, and after the third week of storage I had to report that the greater part of the fruit was decaying. In the 30 degree chamber, however, a very different state of affairs prevailed. At the end of the third week I was able to report : "The exposed fruit in No. 3 is all sound, but dull and flabby-looking, the flesh tough ; the fruit in wool is sound, clear, and fresh, the flavour excellent ; the fruit in paper is sound, but dull, and the flesh rather tough."

The strawberry experiments may be epitomised as follows : (1) The fruit cannot be kept long in a temperature of 36 degrees or upwards ; (2) it can be kept for three weeks at least in a temperature of 30 degrees ; (3) it is necessary to surround the fruit with cotton wool, or, in the case of fruit in sieves, to place a pad of that material over the top. If this precaution is not taken the fruit, though sound, becomes dull and loses the fresh, inviting appearance which is so important when it is offered for sale.

Black Currants.—A series of experiments with these began on August 10, and weekly observations were made. In No. 1 chamber the temperature was 36 degrees, in No. 2 30 degrees, and in No. 3 26 degrees. At the end of ten days the fruit was sound, fresh, clear, and in good market condition. From that time it began to shrivel, there being little to choose between the chambers, or the fruit exposed, in paper and in wool, respectively. Inasmuch as the value of black currants may rise if good fruit can be held over a glut lasting only for a few days, I was disposed to regard this experiment as a qualified success rather than an absolute failure. Nevertheless, the fact that the fruit could not be kept from shrivelling for a fortnight was a disappointment. Subsequently the idea occurred to me to have some of the fruit removed from the store and kept for a few hours in a normal temperature, thus subjecting it to the same conditions as would prevail in the case of fruit *en route* from farm to market. This was done at the end of the third and again at the end of the fourth week. It elicited a curious, interesting, and instructive fact, namely, that the fruit when almost as wrinkled as dried shop currants will plump and freshen to such a degree as to be marketable. This was especially the case with black currants that had been stored in market sieves covered with a wad of cotton wool. After a fortnight's storage the temperature in No. 2 was raised to 32 degrees, and this seemed to give the best results of all.

Red Currants.—The experiments with this fruit were an unqualified success. No. 1 chamber was maintained at 36 degrees. No. 2 was started at 30 degrees, and raised after a fortnight to 32 degrees. No. 3 was started at 26 degrees and raised to 30 degrees. The fruit was stored on August 10, and was examined with great care for six consecutive weeks. To begin with, 26 degrees and even 30 degrees were found to be too cold. With the former the fruit froze and with the latter lost clearness. Excellent results were, however, got in chambers 1 and 2. The fruit remained perfectly sound for six weeks, and when exposed for sixteen hours to a normal temperature maintained its freshness. The fruit surrounded by paper was better than that exposed and also superior to that in wool ; indeed, it was difficult to distinguish it from freshly-gathered fruit. Wool seemed to encourage bleeding, and the ideal conditions seemed to be (1) a temperature of 32 degrees to 36 degrees, (2) a covering of paper to prevent contact with the currents of air constantly flowing.

Cherries.—The temperature of No. 1 chamber was kept at 42 degrees, of No. 2 at 36 degrees, and of No. 3 at 30 degrees for this fruit. It had been in store a fortnight when I began my visits. In No. 1 the exposed fruit was sound but dull ; the fruit in wool was not only sound but quite fresh and clear ; that in paper was somewhat mouldy. The end of the third week found all the fruit decaying and mouldy. A much better condition of affairs existed in the intermediate chamber. At the end of the third week all the fruit was quite sound. A defect of the fruit exposed (and in a lesser degree that in paper) was that it was dull. The fruit covered with wool, however, was not only sound, sweet, and juicy, but fresh and clear. The same condition was observable at the end of the fourth week. After that the fruit began to wrinkle. Almost the same remarks apply to No. 3. At the end of a month the fruit was sound, but flabby and dull exposed and in paper ; covered with wool it was clear and fresh.

Plums.—A series of experiments with the four varieties, Orleans, Greengage, Sultan, and Diamond, began on August 24, and later on Monarch, Victoria, and Coe's Golden Drop were put in store. The first four only are dealt with now. They were placed in temperatures of 36 degrees, 32 degrees, and 30 degrees, respectively. The fruit was removed from the chambers on November 4, and examined on the following morning, after being exposed to the normal temperature for about sixteen hours. The greengages were all perfectly sound and of excellent market appearance, except that the fruits which had been on the upper parts of the heaps were a little wrinkled. So luscious and good did they seem, both internally and externally, that it was a disappointment to find that they tasted distinctly of paint. They had been put in before the smell of paint had passed off. The fact, however, does not destroy the significance of the experiment—namely, the successful keeping of greengages for ten weeks. With respect to Orleans, Diamond, and Sultan, all three were much inferior. None of these can apparently be kept good for ten weeks. If stored just before they are quite soft they will remain in good condition for a month or six weeks. We had them exposed on the shelves, but I think they would have been better covered with a pad of cotton wool, and I am led to this conclusion by having observed that the fruit at the lower part of the heaps, and protected, to a certain extent, from contact with the air by that above, was fresher and fuller than the upper layer. As regards temperatures, the highest was the least suitable. There was little to choose between the others, and 32 degrees may be regarded as about right. A fuller report of the plum experiments will be made.

Tomatos.—After six weeks' storage, the fruit from No. 1 chamber (temperature 36 degrees) proved, on being cut open, to be quite good. The leaf-stalks had, however, decayed, and at the points of their attachment the fruits were externally blackened. This gave a fallacious appearance of decay. The blackening was merely a local, or surface, trouble, not extending to the body of the fruit ; nevertheless, appearances play so important a part in market produce, that it would seem to be advisable for the stalks to be removed when the fruit is stored. The samples, which had been carefully chosen, showed that the fruit which was in the best condition at this examination was that gathered just in advance of softening for dead ripeness, *i.e.*, fruit that had coloured, but was still firm. Further tomato trials are in progress. Fruit in various stages of ripening is under examination in lower temperatures, and particulars will be given in the final report.

An Expert on Cold Storage.—In view of the fact that doubt may be felt as to whether the cold storage of fruit has commercial advantages in this country, it will be well to give the opinion of Mr. W. N. White, a great Covent Garden dealer. He has stated to an interviewer his conviction that, "with proper refrigerating facilities, English fruit might almost drive foreign produce out of the market. Most English fruit enjoys a very short season—from six weeks' to two months' duration. All the fruit becomes ripe about the same time ; the growers throw it on the market ; the buyers become masters of the situation, and if it were not for the jam-makers the stuff could not be sold at all. If there were adequate cold storage, one-third more English fruit could be sold at 25 per cent. more money."

General Remarks.—The following suggest themselves as important points : (1) The fruit must be placed in store in advance of dead ripeness. This is particularly the case with strawberries. Fruits that are fully ripe will keep for some time, but lose surface freshness, becoming seared and unsightly. (2) It is useless to put injured fruit in store. Cherries pecked by birds soon go off and other fruits impaired in any way will not keep. To achieve success the fruit must be sound. (3) The fruit should be covered or surrounded with cotton wool. It was observable that that so treated retained its freshness much longer than that left exposed. (4) The chambers must be kept dry, and close-fitting doors are necessary, otherwise damp and gritty impurities find entrance. We had a little initial trouble with No. 2 on this account, and after it was remedied the fruit kept much better. (5) All decaying or impure matter must be rigidly excluded. The Dartford chambers (which are open to the inspection of anyone interested) are models of cleanliness. Nevertheless, some fruit placed in one before the smell of paint had quite disappeared tasted unpleasant.

Future Experiments.—The work successfully undertaken with early fruits is being continued with later kinds. We have in store some of the popular early market apples, such as Worcesters and Duchess's Favourite, such well-known pears as Williams, Conference, Fertility, Doyenne du Comice, Pitmaston Duchess, and Beurre Hardy ; also grapes, peaches, and tomatos. In the main, attention is being concentrated on early sorts that will not keep under normal conditions, rather than on others which will keep in ordinary fruit rooms. Records of these experiments are being carefully kept, and will be published in due course, together with tables of observations, temperatures, and losses by evaporation, and suggestions for the practical general application of cold storage arising from the Dartford experience.

Contributions of fruit are acknowledged with grateful thanks from Mr. W. Chambers, of Southfleet, and Mr. R. Mercer, of Rodmersham, members of the Kent County Council; from Messrs. Bunyard and Co., the well-known Maidstone pomologists; Messrs. Cheal and Sons, the famous Crawley nurserymen; and Messrs. Rivers and Son, of Sawbridgeworth, who have done so much to improve the varieties of fruit; likewise from Mr. A. J. Thomas, an able and much respected grower in the Sittingbourne district.

In conclusion, I am sincerely glad, Mr. Chairman and gentlemen, to be able to record some noteworthy initial successes. Your efforts to assist British fruit-growers in a new branch of an old industry already have a reward, and on the valuable practical basis now established a really useful store of knowledge may, I believe, be built up.

DISQUALIFICATIONS AT FLOWER SHOWS.

THE frequent recurrence at exhibitions of this unpleasant feature (you have mentioned an apparent bad case at page 692) shows that there is much that is radically wrong in the acts of executives in respect of schedule wording, of exhibitors in mistakes, and in judges in being far too ready to act harshly on misapprehension. The committee appointed by the Royal Horticultural Society some time since to prepare a code of rules for judges' guidance endeavoured, in the large edition issued and now sold out, to deal with this matter. But, whilst their conclusions were that even where trifling errors were committed by an exhibitor who had not the least intention to do wrong the judges must disqualify, there was a saving, though not a very consistent, clause added to the effect that when such disqualified exhibits were meritorious a special prize may be recommended to be awarded to them. A further clause repeated the instruction to the judges to rigidly disqualify. At the meeting of the committee held to prepare a second edition strong opinions were expressed that the regulation referred to was unduly harsh in its operation in many cases, especially where the error in the exhibit likely to produce disqualification was produced by mere inadvertence, failure to read the schedule correctly, accident, or wilful act on the part of some other person. It was also thought that judges, on whose shoulders were placed the entire responsibility of determining disqualification, were placed in a position of undue and even painful responsibility.

The new regulation, as recommended to the Council, now takes the form of providing a court of appeal, but without the intervention of the exhibitor. Whilst the burthen of the act of disqualification still remains with the judges, these persons are advised to require the presence of the secretary or manager of the show, who shall first decide whether the case is one that calls for disqualification. If he determines not so, then the award will be made as if no question had been raised; if he determines the other way, then the disqualification ensues. It is very much a case in which the *bona fides* of the exhibitor have to be considered, as also other matters, and the responsibility of determination one way or another more properly rests with the executive, the actual framers of the schedule, than with the judges, whose duties properly are to decide merits and not technical interpretations. Of course, there are some cases in which the exhibitor has put himself absolutely out of court, but, after all, these are very few relatively, whilst by far the great majority of cases arise from purely technical errors, that it is so obvious are absolutely unintentional, for no exhibitor would be so unwise as to deliberately court disqualification to his own great personal loss and disrepute. Many statements were made to the committee of facts relating to exhibits leading to disqualification quite outside the exhibitor's control, and little suspected, yet for which the unfortunate competitor has been made unjustly to suffer. Flower show justice should invariably be tempered with equity and mercy. A. D.

OBITUARY.

MR. W. G. PRAGNELL, who for upwards of forty years occupied the position of head gardener at Sherborne Castle, died suddenly a short time since in his sixty-first year. Mr. Pragnell, who was well known as a successful cultivator and exhibitor of fruits and vegetables, was highly esteemed by a wide circle of friends.

JOHN TURNER PAYNE, the youngest son of Mr. C. Harman Payne, died, we regret to announce, quite unexpectedly on the 20th inst., after undergoing an operation.

Fruits as Foods.—The Vegetarian Society, headed by no less a distinguished leader than Mr. Arnold F. Hills, has, through the agency of a Christmas issue of its ordinary publication, sought to present object lessons in relation to the diverse diets of fruits and meat. Judging by what has of late been seen on every hand, the effort is an heroic one, for certainly Christmas is the great sacrificial season of flesh, fish, and fowl, and courage is indeed needed on the part of those who at such a time would contend for the fruit as against the flesh. But, if there has been a wonderful flesh array, there has been not a less striking one of fruits and vegetables. If we bring meat and fowl from the uttermost ends of the earth, so we do fruits, and in the variety presented, as well as in tempting form, there is far more than enough to satisfy the most exacting of vegetarian appetites. Certainly Christmas is the high festival of the stomach, and it is in one way or another filled to repletion. Even our vegetarian friends find it hard to be ascetic, when tempted by grapes, pines, oranges, pears, apples, bananas, raisins, and all sorts of dried and candied fruits, as well as vegetables in exceeding abundance. If anyone is disposed to be vegetarian, there is no lack of needful food, no end hardly to the variety. If the butcher and the poulterer seem for the time to be "universal providers" for man's flesh needs, the fruiterer and grocer run them very hard as caterers, and with no little success. Apart from all food contentions, however, there can be no doubt that a vastly increased demand for all sorts of garden products would be greatly to the benefit of horticulture, therefore gardeners can look with sympathy upon vegetarian efforts.—A. D.

THE MESSAGE OF PEACE is always appreciated and respected by all true men, for many of us hope the time is not far distant when it may be universally adopted by all nations. When this comes to pass, happiness and prosperity will be the rule and not the exception. In the meantime, Holloway's Pills and Ointment have largely helped to make foreign nations understand that Englishmen delight in alleviating pain and suffering. These wonderful remedies have been blessed in many lands for the relief they have afforded and the cures effected. They are specially adapted for all complaints affecting the liver, stomach and kidneys, and at this season no family should be without a supply.—[ADVT.]

CHEMICAL MANURES IN VEGETABLE CULTURE.

AT a recent meeting of the Isle of Wight Horticultural Association Mr. F. W. Shrivell, F.L.S., of Tonbridge, gave a lecture on the use of chemical manures in the cultivation of vegetable culture.

Mr. Shrivell, in his opening remarks, stated that they were at Golden Green, testing the economical value of chemical or artificial manures as compared with dung. They wanted to know really if it was possible to grow market produce more cheaply by the aid of small quantities of chemicals and dung than with large quantities of dung alone. The past season, again, had been a terrible one for want of rain, the rainfall having fallen far below that of last year, while the rainfall of last year was far below the usual average. On their dry soil they had consequently found it difficult to raise anything, but nevertheless their crops looked remarkably well, everything appertaining to the cabbage tribe especially. This was their fifth year of experimental work, and with the advance of each year the reports became more interesting. He hoped to show that by the judicious use of chemicals they not only increased their crops, but kept the ground in marvellously good heart; in fact, their ground was producing more this year than it had ever done before, even through the past exceptionally dry summer. Their system had been to add chemicals to the land to as far as possible take the place of dung. The chief value of dung consisted in the potash, phosphoric acid, ammonia, and lime it contained. They were therefore putting these four chemicals into the ground in suitable proportions, and with a judicious use of that mixture they were obtaining marvellous crops, and at a much cheaper rate than could be produced by the aid of dung alone. Mr. Shirvell then proceeded to show by diagrams the progress which had been made on experimental plots during the last four years, and the approximate cost of the fertilisers used. The diagrams included the following:—

A
25 LOADS DUNG
1 cwt. Nitrate of Soda
{6 cwt. Basic Slag, or
{4 cwt. Superphosphate of Lime
Cost £6 10s. per acre.

B
25 LOADS DUNG
2 cwt. Nitrate of Soda
{6 cwt. Basic Slag, or
{4 cwt. Superphosphate of Lime
Cost £7 per acre.

C
CHEMICALS ONLY
4 cwt. Nitrate of Soda
{6 cwt. Basic Slag, or
{4 cwt. Superphosphate of Lime
Cost £3 per acre.

D
25 LOADS DUNG
4 cwt. Nitrate of Soda
{6 cwt. Basic Slag, or
{4 cwt. Superphosphate of Lime
Cost £8 per acre.

E
25 LOADS DUNG
Cost £5 per acre.

F
50 LOADS DUNG
Cost £10 per acre.

Dealing by the aid of his large diagram (in which all the results were calculated upon a per acre basis) with some of the most interesting crops, the lecturer first took

ASPARAGUS (FIRST YEAR'S CUTTING).

	Bundles per acre (50 sticks).	Weight per Bundle.
F Plot	603	17 oz.
E Plot	687	17½ oz.
D Plot (Salt)...	804	21½ oz.
D Plot (Kainit)	1,158	20½ oz.
C Plot (Salt)...	622	17½ oz.
C Plot (Kainit)	806	21 oz.

It would be seen, he said, from the above figures that they had grown an enormous crop by the use of chemicals. Where they reduced their heavy dung from 50 (F) to 25 (E) loads per acre, they grew, singularly enough, a few more bundles, and heavier in weight. But where they added chemicals to the dung the crop and weight were much larger and heavier. Thus it had been proved that by giving a light coating of dung to the beds in the winter, and a moderate dose of chemicals in the summer, they increased their crop to a very marvellous extent, in reality they had nearly doubled it.

SECOND YEAR'S CUTTING.

	Bundles per acre (50 sticks).	Weight per Bundle.
F Plot	1,109	18 oz.
E Plot	1,111	17 oz.
D Plot (Salt)...	1,132	19½ oz.
D Plot (Potash)	1,351	21¼ oz.
C Plot (Salt)...	990	19 oz.
C Plot (Potash)	1,029	21 oz.

In this second year, again, by the substitution of potash for salt, the crop was largely increased. On the sea coast asparagus beds were manured with sea-weed, the idea being that it was the salt which did the good. But these experiments had shown it to be the potash of the weed, and not the salt, which was most beneficial, and the best plan was to leave the salt out entirely, for it did very little good at all.

TRIPOLI ONIONS (two years' average).—F plot, 9 tons; E plot, 7 tons; A plot, 9 tons 7 cwt.; B plot, 9 tons 5 cwt.; D plot, 10 tons 15 cwt. With this crop the heavy dressing of dung produced two tons more than the light dressing, but a light dressing of chemicals, in addition to the light dressing of dung, produced a slightly better crop, while a heavy addition of chemicals raised the crop to 13¾ tons per acre. This year they had a still more enormous crop, as follows: F plot, 12 tons 12½ cwt,; E plot, 14 tons 11½ cwt.; A plot, 15 tons; B plot (potash), 19 tons 1 cwt.; D plot, 17 tons 14¾ cwt.

Those weights were all marketable onions, but the most interesting feature was the proportion of unmarketable onions—those which had gone to seed or were rotten—to each plot. On the F plot there were five tons of unmarketable onions per acre, but on the E plot only 13¾ cwt., and on the B 2 tons 13½ cwt. The inference was that the dung being put in the ground before the seed was sown the onions were brought along too rapidly; whereas the chemicals being put in later had done their work quietly and well, and there were not nearly so many rotten onions. A large number of the bulbs were over one pound in weight, and it should be remembered that they were grown on an open corn field and on a very poor soil.

STRAWBERRIES (three years' average).—F plot, 1 ton 7½ cwt.; E plot, 1 ton 12 cwt.; B plot (no Kainit), 1 ton 19½ cwt.; C plot (no Kainit), 1 ton 3 cwt. Fourth year's crop—F plot, 2 tons 12 cwt.; E plot, 4 tons 4¼ cwt.; B plot, 4 tons 7 cwt.; C plot, 2 tons 9¾ cwt. A comparison of those figures showed a wonderful increase in the fourth year's crop. There was a limit to the manuring of strawberries, and they found the best method was to give the plants a light dressing of dung and chemicals every year. They dug in the dung during the winter, put on the phosophates at the same time, and the nitrate of soda either in February or March. By those methods they also managed to get an earlier crop. In the first six days of picking they gathered 19½ cwt. on the plot heavily dressed with dung; 18¾ cwt. on the lightly dressed plot; but 1 ton 5½ cwt. on the chemical plot. It was an all-important feature, too, that they had been able to put the strawberries on the market earlier than usual. They had also tested their keeping qualities for four years, and found that where the plots were heavily dunged the fruit kept very badly, and was as a rule too soft for marketing purposes. But where they had been manured lightly with dung and chemicals the strawberries were comparatively fresh at the end of three days. There was a great difference in the condition of the strawberries where lightly manured, and they could rely upon being able to send them to market fresh without becoming soft and wet.

BRUSSELS SPROUTS (four years' average).—F plot, 282 sieves; E plot, 257 sieves, D plot, 321 sieves; C plot, 305 sieves; C plot (plus salt), 267 sieves. With such a valuable crop as this, said Mr. Shrivell, it was interesting to show the relative value of the produce and the cost of manuring, which worked out as follows:—

Plot.	Sieves.	Cost of Manure.	Produce at 1s. 6d. per Sieve.
E	257	£5 0 0	£19 5 0
F	282	10 0 0	21 3 0
C	305	3 2 0	22 17 0
C (plus salt) ...	267	2 17 0	20 0 0

Thus there was an actual saving in cost of manure as against heavy dung of over £6 per acre, and an increased yield of sprouts equivalent to over £2 per acre, making a saving of £8 or £9 per acre. In the case of celery and onions they could not do without dung, but it would be seen that in the case of Brussels sprouts they could do without dung. The average he had given was of four particularly dry years, and this year again, though even more dry, the crop looked remarkably well.

CAULIFLOWERS (four years' average).—F plot, 15 tons 2 cwt.; E plot, 12 tons 8 cwt.; D plot, 15 tons 9 cwt.; C plot, 14 tons 8 cwt. This crop, again, furnished a convincing proof of the value of chemicals for all the cabbage tribe, as the chemical plot, which had never had any dung, had produced two tons more cauliflowers than the plot which had had 25 loads of dung per year for five years; while the chemicals only cost £3 per acre per year, and the dung £5. The effect of chemicals on the crop not only increased the yield, but added flavour and gave tenderness, which was a most important thing in such vegetables.

BROCCOLI (three years' average).—Average weight F plot, 2 lb. 3 oz.; E plot, 1 lb. 14 oz.; A plot, 2 lb. 4 oz.; B plot, 2 lb. 8 oz.; D plot, 2 lb. 9 oz.; C plot, 2 lb. 7 oz. Fourth year, 1898: Average weight F plot, 2 lb. 8 oz.; E plot, 2 lb. 4 oz.; A plot, 2 lb. 6 oz.; B plot, 2 lb. 12 oz.; D plot, 3 lb. 6 oz.; C plot, 2 lb. 12 oz. Although during the four years the dung had cost £40 and the chemicals £12, they had grown more produce by the aid of chemicals alone. Some people had an idea that chemicals ran out and impoverished the ground, and that dung simply remained in the soil and kept on adding goodness to it. He thought the illustration which he had just given in reference to broccoli was conclusive that by judicious use of chemicals the ground was really increased in value.

SPRING CABBAGE (three years' average).—F plot, 15¾ tons; E plot, 15¾ tons; B plot, 17½ tons; D plot, 16¾ tons; C plot, 18¾ tons. Fourth year, 1898: F plot, 16 tons 5¼ cwt.; E plot, 13 tons 11¼ cwt.; B plot, 16 tons 14 cwt.; D plot, 19 tons 5¼ cwt.; C plot, 17 tons 6½ cwt. Here, again, was another marvellous result. With chemicals alone they had grown 18¾ tons per acre for the last three years; and in the fourth year the chemical plot had again beaten the heavily-dunged plot.

POTATOS.—To grow potatos there must be some dung in the ground, and in particularly dry years it assisted materially to keep the ground moist. With hardly any rain at all the past season had been a very trying one for potatos, but still, those grown on the experimental plots were very fine and healthy. The following was the average yield during the last four years: Early variety—F plot, 123 sacks; E plot, 106 sacks; B plot, 113 sacks; C plot, 89 sacks. Main crop—F plot, 134 sacks; E plot, 110 sacks; B plot, 127 sacks; C plot, 103 sacks.

AUTUMN CABBAGE (three years' average).—F plot, 26 tons; E plot, 23½ tons; A plot, 29 tons; B plot, 28½ tons; D plot, 29¾ tons; C plot, 27½ tons. The following table furnishes the increase in yield during those three years: Due to 25 loads of dung, F, 2¼ tons; chemicals, A, 5½ tons; chemicals, B, 4¾ tons; chemicals, D, 6¼ tons; chemicals (without dung), C, 4 tons.

SPINACH.—The following figures show that chemicals added to 25 loads of dung per acre would produce a much bigger crop at a very much cheaper cost: F plot, 18 tons; E plot, 16 tons; A plot, 18¾ tons; D plot, 22¾ tons.

CARROTS.—This year the carrot crop had been a failure. Right through the plots the carrots had been eaten up by flea, and after seeding the ground three times they gave it up in disgust. The following was the average crop for the last four years: E plot, 16 tons 17 cwt.; B plot, 18 tons 6 cwt.; C plot, 17 tons 17 cwt.

Concluding his lecture, Mr. Shrivell said that the use of chemicals very materially increased the value of dung, and the proper method of gardening was to throw aside all old-fashioned prejudices, and take up the use of chemicals in addition to dung. They all knew some very fine produce had been grown in the past by the aid of dung alone; but there was no reason why, as time went on, they should not try to grow it as good, and at a much cheaper cost, by the use of chemicals. They must call in science to the aid of practice. The two would go very well together, but one could not do without the other.

Sweet Peas.—Referring to your leader on Sweet Peas and how to obtain extra strong plants and early bloom, I venture to draw attention to the method adopted by Mr. C. J. Salter at Woodhatch, Reigate. He has several long boxes, or troughs, of stout wood some ten inches wide and eight inches deep. These being thoroughly cleansed, then having sufficient drainage, are filled with coarse loam, the turfy pieces coming next to the drainage. The soil is well pressed, then sweet peas are dibbled in thinly all through the middle of the troughs, next watered and stood near the glass in a warm frame. Growth soon follows, then hardening, and the plants are several inches in height, when the boxes may be safely stood outdoors in a warm position and handy for watering. Soon tall stakes are added, and in such limited root room, being, of course, well fed, the growth and flower production is wonderful.—A. D.

MR. JAMES FULTON, for the past two and a-half years head gardener to Sir Charles Barrington, Bart., Glenstal Castle, Murroe, Co. Limerick, has been appointed head gardener to W. S. Gilbert, Esq., Grimes Dyke, Harrow Weald, Middlesex, and enters upon his duties there on January 2.

ANSWERS TO CORRESPONDENTS

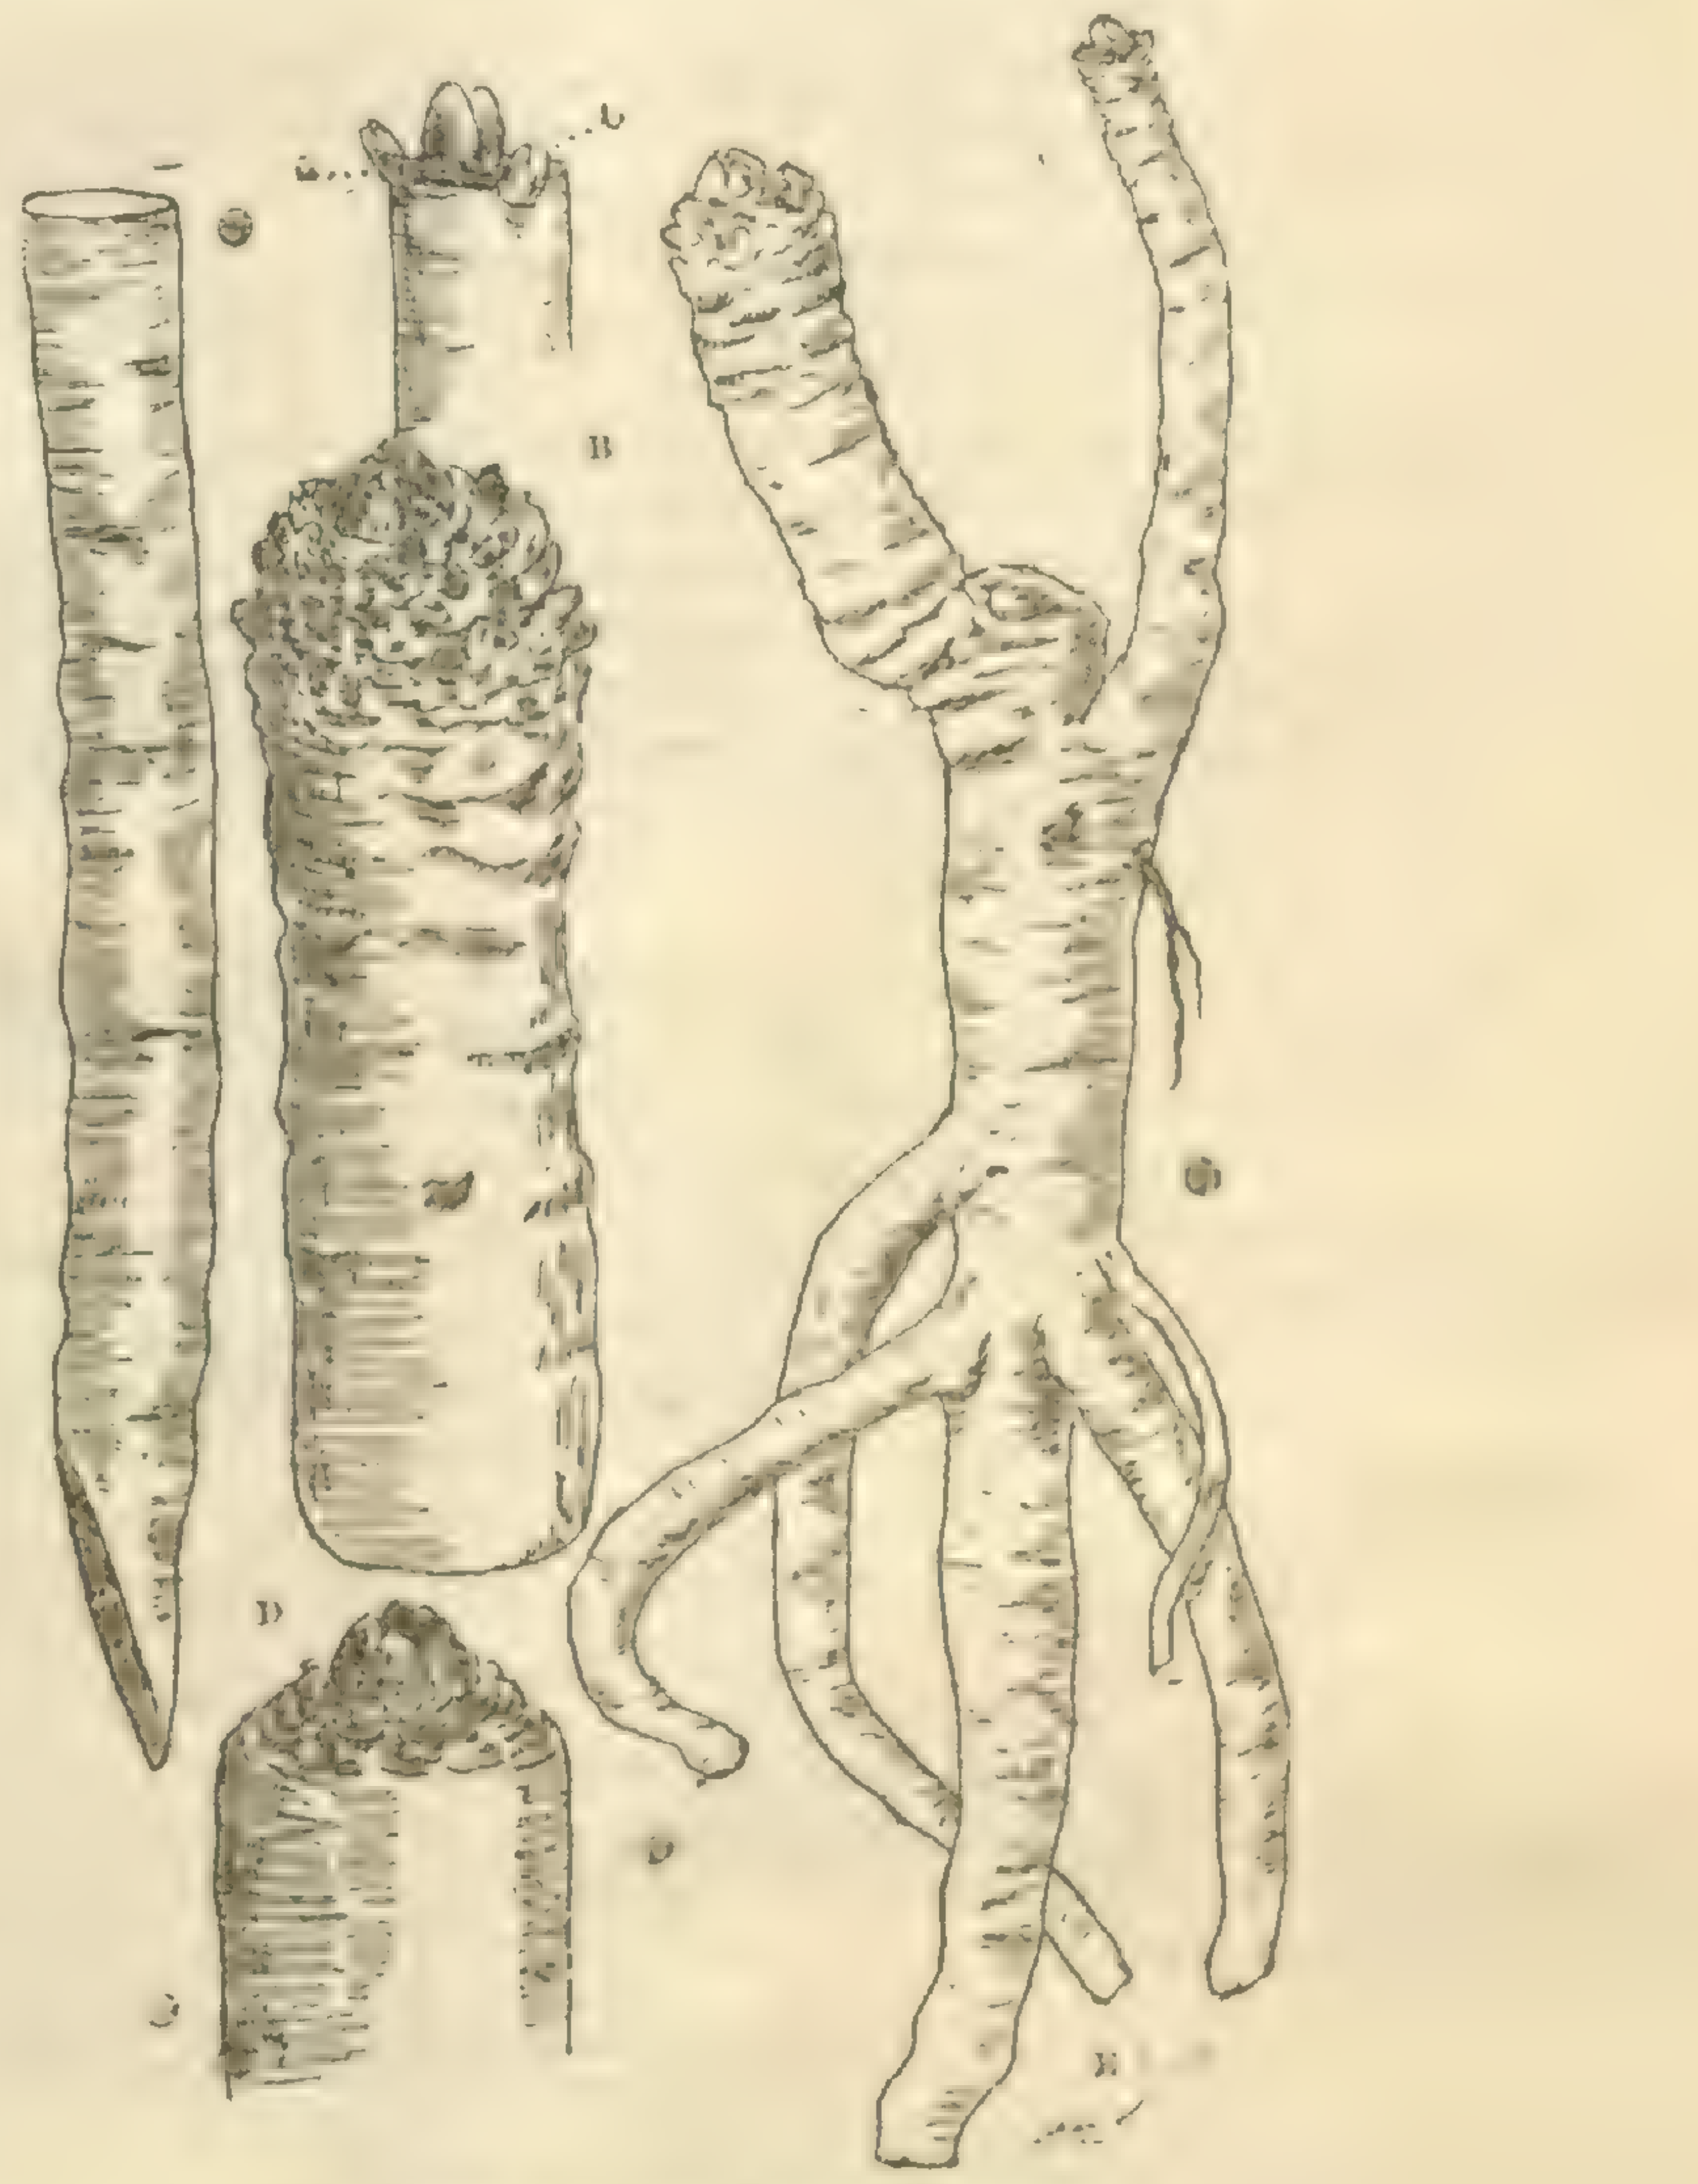
Editorial communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, &c., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning change of dates.

Propagating Seakale.—Novice, Sussex: The propagation of seakale may be so readily effected by means of seed and cuttings that you will have no difficulty in obtaining a large stock of crowns for forcing. If you have no crowns from which to obtain root cuttings it will be necessary for you to purchase small crowns or to raise a stock from seed, which, as you will see on reference to a seed catalogue, is not expensive. An experienced cultivator will, if the soil is naturally deep and rich, be able to produce crowns of a suitable size for forcing from seed sown in the spring previous, but to accomplish high-class culture is essential. He would commence by liberally manuring and deeply digging the soil early in the winter, and have the surface somewhat rough. Towards the end of March he would break down the surface, and shortly afterwards will draw shallow drills eighteen inches apart and distribute the seed thinly along them and cover with soil. The after cultivation consists in using the hoe freely for the purpose of destroying weeds and maintaining the soil in a loose condition, and in giving one or two thorough soakings of water should the weather be exceptionally dry during the summer. As you have had but little experience in the cultivation of this vegetable we would suggest that you do not adopt this express method of culture and instead sow the seed rather thinly on a bed of soil and thin to three or four inches apart where the plants are crowded. By this means you will obtain by the end of the autumn a supply of crowns of a suitable size for planting. Lift these in the autumn, take off the lower portion about six inches from the crown, and from those crowns which have more than bud remove all but the strongest. Tie them up in bundles, and then put them in a trench with the crowns level with the surface, and pack the soil firmly about them. These are to be planted early in March in soil that has been liberally manured, the rows to be eighteen inches apart, and the crowns ten inches from each other in the rows. By the autumn these will have become stout crowns like D, and will be furnished with side roots as in the case of E, which represents an old root that has been allowed to form two crowns. The root should have the lower part taken off as in D, and the thong-like roots be cut into six inch lengths, as represented at A, which should have a sloping cut at the lower end to facilitate planting. B shows the cutting commencing to produce buds, and of these those at the side A A should be rubbed off, leaving the central bud to form a crown, as shown by C. The thong-like or side roots are to be dealt with in precisely the same manner as advised for the seedlings.



PROPAGATING SEAKALE.

Protecting Standard Tea Roses.—Amateur, Beds: Some amount of protection is required by tea roses grown in standard form, and a course of procedure equally remarkable for its simplicity and efficiency is to so fasten a few pieces of bracken about the heads to cover the growths without preventing a free circulation of air about them; sprays of yew spruce may be used in a similar manner.

Starved Fruit Trees.—Young Gardener: It is difficult to say whether the preferable course would in your case be to cut down the trees or make an effort to restore them to a vigorous state of health, as you give us but little information relating to them. In view of the fact that they have been much neglected of late years, we would suggest that you make an effort to restore their vigour. One of the best means of stimulating half-starved apple and pear trees into activity is to give them copious supplies of liquid manure from the stable or farmyard or house sewage during the winter months. Failing a sufficient supply of liquid manure or house sewage, give the soil as far as the branches extend a dressing at once of artificial manure consisting of muriate of potash and bone superphosphate in the proportions of one to two. The mixture should be spread evenly over the surface at the rate of two ounces to the square yard, and lightly forked in. After the trees have commenced to make new growth in spring apply a dressing of nitrate of soda at the rate of half an ounce to the square yard, and if the weather is dry give the trees a watering to dissolve the nitrate and assist in its conversion into a form in which it can be taken up by the roots.

Bouvardias and Carnations.—W. S., Yorkshire: The propagation of tree carnations may be effected in October and November, and from the middle of February until May. The multiplication of the stock of tree carnations is usually effected in the spring months, but side growths taken off carefully in either of the two autumn months mentioned root freely with the assistance of a temperature somewhat above that of the greenhouse, and make fine plants for flowering twelve months later. Some varieties produce side growths less freely than the other, and it is essential that in no case must plants coming into bloom be stripped of their "grass," or indeed have any considerable proportion of the growths removed. You will avoid the difficulties experienced last year in the propagation of bouvardias by first obtaining a crop of young shoots for furnishing cuttings. Towards the end of February select a few plants of each variety, those going out of bloom for preference, and keep them rather dry for two or three weeks to ensure a brief period of rest. Then cut them back moderately, destroy the prunings, and place the plants in a warm corner of the forcing house, increase the supply of water at the roots, and syringe overhead once or twice daily. Under the conditions mentioned they will soon commence to make new growth, and when the young shoots are about two inches in length they may be utilised for propagating purposes.

Names of Plants.—Under this heading we can only undertake to name species and specific varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp moss or leaves as packing material to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that the numbers be legible and firmly attached to the specimens. We cannot promise to name more than six specimens at one time from any one correspondent.

F. W. S.: 1, Campylobotrys Ghiesbreghtianus; 2, Didymocarpus lacunosus; 3, Agalmyla staminea, Toxicophlæa spectabilis; 4, Bertolonia pubescens.

R. M., Devon: 1, Cypripedium Sedeni porphyreum; 2, Cæalgyne cristata, Chatsworth variety; 3, Angræcum eburneum; 4, not a form of Dendrobium nobile as you suggest, but D. Linawianum, which is also known in collections under the name of D. moniliforme, and is well worth growing for its usefulness in contributing to the attractions of the orchid house at mid-winter; 5, Lælia anceps, rather a poor form.

W. W.: 1, Aotus gracillimum; 2, Cleyera japonica variegata; 3, Acanthopanax quinquæfolius variegatus; 4, Sarracenia crispata; 5, Ophiopogon jaburan argentea variegatus.

A. B.: The plant with the green leafage is Daphne indica rubra, and the variegated plant, D. japonica variegata; specimens sent for naming should invariably be distinguished by numbers.

Amateur, Sussex: The trusses of zonal pelargoniums that you have sent have been much damaged in their passage through the post in consequence of their having been packed in a thin cardboard box, and the varieties are past recognition. So many of the varieties of the zonal pelargonium closely resemble each other that we cannot undertake to name them, or indeed other florists' flowers.

O. H., Taunton: 1, a pretty form of Cypripedium Leeanum, but not C. L. giganteum or C. L. magnificum; 2, Oncidium sphacelatum; 3, Calanthe Veitchi.

C. G., Teynham: 1, Dipplopappus chrysophyllus; 2, Olearia Haasti; 3, Phillyrea decora (Phillyrea vilmoriniana of gardens).

Names of Fruits.—We are pleased to assist our readers as far as it is possible to do so in naming fruits, but it is absolutely necessary that they should send us good specimens carefully packed, as it is only when characteristic examples reach us in perfect condition that we are able to determine their names. We are compelled to insist on the observance of this rule, as so many specimens now reach us. We cannot undertake to name more than six varieties at one time; and both apples and pears should be sent when approaching maturity, but before they are fully ripe, that we may have the assistance of their distinctive colours in determining their identity.

C. B., Worksop: 1, Winter Nelis; 2, Glou Morceau; 3, Catillac.

T. T. E., Bromley: 1, Bramley's Seedling; 2, Mère de Ménage; 3, Blenheim Pippin; 4, Court Pendu Plat.

G. S. A., Southgate: 1, King of the Pippins; 2, Egremont Russet; 3, Dumelow's Seedling.

S. R., York: 1, French Crab; 2, Newton Wonder; 3, Northern Greening.

B. B., Sale: 1, Norfolk Beefing; 2, Vicar of Winkfield.

R. N. S., Exeter: 1, Uvedale's St. Germain; 2, Fearn's Pippin; 3, Royal Russet; 4, Easter Beurre; 5, Wyken Pippin; 6, Reinette du Canada.

F. O. A., Wickham: Allen's Everlasting.

T. M., Ripley: 1, Cox's Orange Pippin; 2, Margil; 3, Claygate Pearmain; 4, Golden Nonpareil; 5, Adam's Pearmain.

L. B., Worksop: Court of Wick.

MARKETS.

Covent Garden.

SUPPLIES are light and the demand is very low, as is usually the case immediately after Christmas. There is a fair demand for cut flowers.

FRUIT.—English apples, 3s. to 8s. per bushel; Nova Scotian and Canadian, 12s. to 22s. per barrel; Californian, 8s. to 9s. per case; French pears, 3s. to 5s. per case; Californian, 4s. to 7s. per half-case; English grapes, 10d. to 1s. 9d.; Channel Islands, 6d. to 1s. per lb.; Almeria, 10s. to 18s. per barrel; Jaffa oranges, 8s. to 10s. per box; Valencia, 8s. to 16s.; Murcia, 6s. to 6s. 6d. per case; pineapples, 1s. 6d to 4s. 6d. each; bananas, 4s. to 9s. per bunch; lemons, 8s. to 16s. per case; English tomatos, 6s. per 12 lb.; Bordeaux, 1s. 6d. to 2s. per box.

FLOWERS.—Arums, 8s. to 12s.; carnations, 2s. to 3s.; chrysanthemums, white, 6s. to 9s.; chrysanthemums, yellow, 4s. to 6s.; eucharis, 4s. to 6s.; gardenias, 2s. to 3s.; Lilium Harrisi, 9s. to 12s.; tea roses, 1s. to 2s.; pink roses, 4s. to 6s.; cattleyas, 10s. to 12s.; Odontoglossum crispum, 4s. to 6s.; poinsettias, 12s. to 15s.; and tuberoses, 1s. to 3s. per dozen blooms; Adiantum cuneatum, 4s. to 8s.; white narcissus, 2s. to 4s.; chrysanthemums, 6s. to 9s.; marguerites, 6s. to 9s.; pelargoniums (scarlet), 12s. to 15s. per dozen bunches; lily of the valley, 1s. to 2s.; Roman hyacinths, 1s. to 1s. 6d.; Azalea indica, white, 1s. to 1s. 3d. per dozen sprays; bouvardias, 4d. to 6d. per bunch.

VEGETABLES.—English onions, 5s. to 5s. 6d. per cwt.; Valencia, 6s. per case; Dutch, 3s. 3d. to 3s. 9d. per bag; eschallots, 8s. to 10s. per cwt.; cucumbers, 2s. 6d. to 4s. 6d.; endive, 1s. 3d. to 1s. 9d.; lettuce, 9d. to 1s.; cos, 2s. to 2s. 6d. per dozen; cabbages, 3s. 6d. to 6s.; cauliflowers, 6s. to 9s per tally; celery, 5s. to 12s. per dozen rolls; Brussels sprouts, 2s. 6d. to 3s. per half-sieve; spinach, 2s. to 2s. 6d. per bushel; seakale, 9d. to 1s. per punnet; mushrooms, 5s. to 8s.; garlic, 3s. per 12 lb.; asparagus, 2s. to 3s. per bunch.

Borough Potato Market.

Trade is very quiet, and there is little business doing, even at the following prices:—Dunbar Bruce, 65s to 70s.; red soil, Main Crops, 70s. to 75s.; grey soils, 65s. to 70s.; Abundance and Bruce, 65s. to 70s.; Beauty of Hebron, Snowdrop, and Up to Date, 70s. to 75s.; White Hebron, Early Puritan, Bruce Magnum, Sutton's Early Regent, Reading Giant, and Imperator, 60s. to 65s.; Blacklands, 55s. to 60s per ton; Germans, 2s. 6d. to 2s. 9d. per bag.

THE WEATHER DURING THE WEEK ENDING DECEMBER 24, 1898.

The mean reading of the Barometer during the week at Greenwich was 30·18 inches, and that of the Thermometer 40°·1, the latter being 1°·2 above the week's average in the 50 years 1841—90. The direction of the wind was variable, the horizontal movement of the air being 17 per cent. below the week's average in the 16 years 1860—75. The duration of registered bright sunshine in the week was 12·9 hours. The measured rainfall amounted to 0·02 of an inch.

IMPORTANT FEATURES.

Our invention, by increasing the width of Centre Casting and continued through to the under row of Top Pipes, assures a free circulation of Hot Water from Fire Box to upper rows of pipes. This is important, as it prevents concussion of the water in boiler when being sharply driven
To prevent the possibility of leakage, each pipe is machine faced on flanges, and all turned to gauge.
Tested to a pressure of 60 lbs. in our works before despatch. Full information and prices on application,

Offices and Warehouses, SOUTHWARK STREET, LONDON, S.E.
